# Low Power Video Op Amp with Disable 

## FEATURES

## High Speed

80 MHz Bandwidth ( $3 \mathrm{~dB}, \mathbf{G}=+1$ )
75 MHz Bandwidth ( $\mathbf{3 d B}, \mathbf{G}=+2$ )
1000 V/ us Slew Rate
50 ns Settling Time to $0.1 \%$ ( $\mathrm{V}_{\mathrm{O}}=10 \mathrm{~V}$ Step)
Ideal for Video Applications
30 MHz Bandwidth ( $\mathbf{0 . 1} \mathrm{dB}, \mathbf{G}=+2$ )
0.02\% Differential Gain
$0.04^{\circ}$ Differential Phase
Low Noise
$2.9 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ Input Voltage Noise
$13 \mathrm{pA} / \sqrt{\mathrm{Hz}}$ Inverting Input Current Noise
Low Power
8.0 mA Supply Current max
2.1 mA Supply Current (Power-Down Mode)

High Performance Disable Function
Turn-Off Time 100 ns
Break Before Make Guaranteed
Input to Output Isolation of 64 dB (OFF State)
Flexible Operation
Specified for $\pm 5$ V and $\pm 15$ V Operation
$\pm 2.9 \mathrm{~V}$ Output Swing Into a $150 \Omega$ Load ( $\mathrm{V}_{\mathrm{s}}= \pm 5 \mathrm{~V}$ )

## APPLICATIONS

Professional Video Cameras
Multimedia Systems
NTSC, PAL \& SECAM Compatible Systems
Video Line Driver
ADC/DAC Buffer
DC Restoration Circuits

Closed-Loop Gain and Phase vs. Frequency, G $=+2$, $R_{L}=150, R_{F}=715 \Omega$
REV. A

[^0]CONNECTION DIAGRAM
8-Pin Plastic Mini-DIP (N), SOIC (R) and Cerdip (Q) Packages

## PRODUCT DESCRIPTION

The AD 810 is a composite and HDTV compatible, current feedback, video operational amplifier, ideal for use in systems such as multimedia, digital tape recorders and video cameras. The 0.1 dB flatness specification at bandwidth of 30 M Hz ( $\mathrm{G}=+2$ ) and the differential gain and phase of $0.02 \%$ and $0.04^{\circ}$ (NTSC) make the AD 810 ideal for any broadcast quality video system. All these specifications are under load conditions of $150 \Omega$ (one $75 \Omega$ back terminated cable).
The AD 810 is ideal for power sensitive applications such as video cameras, offering a low power supply current of 8.0 mA max. T he disable feature reduces the power supply current to only 2.1 mA , while the amplifier is not in use, to conserve power. Furthermore the AD 810 is specified over a power supply range of $\pm 5 \mathrm{~V}$ to $\pm 15 \mathrm{~V}$.
The AD 810 works well as an ADC or D AC buffer in video systems due to its unity gain bandwidth of 80 M Hz . Because the AD 810 is a transimpedance amplifier, this bandwidth can be maintained over a wide range of gains while featuring a low noise of $2.9 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ for wide dynamic range applications.

Differential Gain and Phase vs. Supply Voltage

## ESD SUSCEPTIBILITY

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 volts, which readily accumulate on the human body and on test equipment, can discharge without detection. Although the AD 810 features ESD protection circuitry, permanent damage may still occur on these devices if they are subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid any performance degradation or loss of functionality.

## MAXIMUM POWER DISSIPATION

The maximum power that can be safely dissipated by the AD 810 is limited by the associated rise in junction temperature. For the plastic packages, the maximum safe junction temperature is $145^{\circ} \mathrm{C}$. F or the cerdip package, the maximum junction temperature is $175^{\circ} \mathrm{C}$. If these maximums are exceeded momentarily, proper circuit operation will be restored as soon as the die temperature is reduced. Leaving the device in the "overheated" condition for an extended period can result in device burnout. To ensure proper operation, it is important to observe the derating curves.

## Maximum Power Dissipation vs. Temperature

While the AD 810 is internally short circuit protected, this may not be sufficient to guarantee that the maximum junction temperature is not exceeded under all conditions.

## GENERAL DESIGN CONSIDERATIONS

T he AD 810 is a current feedback amplifier optimized for use in high performance video and data acquisition systems. Since it uses a current feedback architecture, its closed-loop bandwidth depends on the value of the feedback resistor. T able I below contains recommended resistor values for some useful closedloop gains and supply voltages. As you can see in the table, the closed-loop bandwidth is not a strong function of gain, as it would be for a voltage feedback amp. The recommended resistor values will result in maximum bandwidths with less than 0.1 dB of peaking in the gain vs. frequency response.

The -3 dB bandwidth is also somewhat dependent on the power supply voltage. Lowering the supplies increases the values of internal capacitances, reducing the bandwidth. T o compensate for this, smaller values of feedback resistor are sometimes used at lower supply voltages. The characteristic curves illustrate that bandwidths of over 100 M Hz on 30 V total and over 50 M Hz on 5 V total supplies can be achieved.

Table I. -3 dB B andwidth vs. Closed-Loop Gain and
Resistance Values ( $\mathrm{R}_{\mathrm{L}}=150 \Omega$ )

| $\mathbf{V}_{\mathbf{S}}=\mathbf{\pm 1 5} \mathbf{V}$ <br> Closed-Loop <br> Gain | $\mathbf{R}_{\mathbf{F B}}$ | $\mathbf{R}_{\mathbf{G}}$ | $\mathbf{- 3 \mathbf { d B } \mathbf { B W }}$ <br> $\mathbf{( M H z )}$ |
| :--- | :--- | :--- | :--- |
| +1 | $1 \mathrm{k} \Omega$ |  | 80 |
| +2 | $715 \Omega$ | $715 \Omega$ | 75 |
| +10 | $270 \Omega$ | $30 \Omega$ | 65 |
| -1 | $681 \Omega$ | $681 \Omega$ | 70 |
| -10 | $249 \Omega$ | $24.9 \Omega$ | 65 |
| $\mathbf{V}_{\mathbf{S}}=\mathbf{+ 5} \mathbf{V}$ |  |  |  |
| Closed-Loop |  |  | $\mathbf{- 3 d B} \mathbf{B W}$ |
| $\mathbf{G a i n}$ | $\mathbf{R}_{\mathbf{F B}}$ | $\mathbf{R}_{\mathbf{G}}$ | $\mathbf{( M H z )}$ |
| +1 | $910 \Omega$ |  | 50 |
| +2 | $715 \Omega$ | $715 \Omega$ | 50 |
| +10 | $270 \Omega$ | $30 \Omega$ | 50 |
| -1 | $620 \Omega$ | $620 \Omega$ | 55 |
| -10 | $249 \Omega$ | $24.9 \Omega$ | 50 |

## ACHIEVING VERY FLAT GAIN RESPONSE AT HIGH FREQUENCY

Achieving and maintaining gain flatness of better than 0.1 dB above 10 M Hz is not difficult if the recommended resistor values are used. The following issues should be considered to ensure consistently excellent results.

## CHOICE OF FEEDBACK AND GAIN RESISTOR

Because the 3 dB bandwidth depends on the feedback resistor, the fine scale flatness will, to some extent, vary with feedback resistor tolerance. It is recommended that resistors with a $1 \%$ tolerance be used if it is desired to maintain exceptional flatness over a wide range of production lots.

## PRINTED CIRCUIT BOARD LAYOUT

As with all wideband amplifiers, PC board parasitics can affect the overall closed-loop performance. M ost important are stray capacitances at the output and inverting input nodes. (An added capacitance of 2 pF between the inverting input and ground will add about 0.2 dB of peaking in the gain of 2 response, and increase the bandwidth to 105 M H z.) A space ( $3 / 16^{\prime \prime}$ is plenty) should be left around the signal lines to minimize coupling. Also, signal lines connecting the feedback and gain resistors should be short enough so that their associated inductance does not cause high frequency gain errors. Line lengths less than 1/4" are recommended.

## QUALITY OF COAX CABLE

Optimum flatness when driving a coax cable is possible only when the driven cable is terminated at each end with a resistor matching its characteristic impedance. If coax were ideal, then the resulting flatness would not be affected by the length of the cable. While outstanding results can be achieved using inexpensive cables, some variation in flatness due to varying cable lengths is to be expected.

## POWER SUPPLY BYPASSING

Adequate power supply bypassing can be critical when optimizing the performance of a high frequency circuit. Inductance in the power supply leads can contribute to resonant circuits that produce peaking in the amplifier's response. In addition, if Iarge current transients must be delivered to the load, then bypass capacitors (typically greater than $1 \mu \mathrm{~F}$ ) will be required to provide the best settling time and lowest distortion. Although the recommended $0.1 \mu \mathrm{~F}$ power supply bypass capacitors will be sufficient in most applications, more elaborate bypassing (such as using two paralleled capacitors) may be required in some cases.

## POWER SUPPLY OPERATING RANGE

The AD 810 will operate with supplies from $\pm 18 \mathrm{~V}$ down to about $\pm 2.5 \mathrm{~V}$. $\mathrm{On} \pm 2.5 \mathrm{~V}$ the low distortion output voltage swing will be better than 1 V peak to peak. Single supply operation can be realized with excellent results by arranging for the input common-mode voltage to be biased at the supply midpoint.

## OFFSET NULLING

A $10 \mathrm{k} \Omega$ pot connected between Pins 1 and 5, with its wiper connected to $\mathrm{V}+$, can be used to trim out the inverting input current (with about $\pm 20 \mu \mathrm{~A}$ of range). For closed-loop gains above about 5 , this may not be sufficient to trim the output offset voltage to zero. T ie the pot's wiper to ground through a large value resistor ( $50 \mathrm{k} \Omega$ for $\pm 5 \mathrm{~V}$ supplies, $150 \mathrm{k} \Omega$ for $\pm 15 \mathrm{~V}$ supplies) to trim the output to zero at high closed-loop gains.

## AD810

## CAPACITIVE LOADS

When used with the appropriate feedback resistor, the AD 810 can drive capacitive loads exceeding 1000 pF directly without oscillation. By using the curves in Figure 45 to chose the resistor value, less than 1 dB of peaking can easily be achieved without sacrificing much bandwidth. N ote that the curves were generated for the case of a $10 \mathrm{k} \Omega$ load resistor, for smaller load resistances, the peaking will be less than indicated by Figure 45.
Another method of compensating for large load capacitances is to insert a resistor in series with the loop output as shown in Figure 43. In most cases, less than $50 \Omega$ is all that is needed to achieve an extremely flat gain response.

Figures 44 to 46 illustrate the outstanding performance that can be achieved when driving a 1000 pF capacitor.

## DISABLE MODE

By pulling the voltage on Pin 8 to common ( 0 V ), the AD 810 can be put into a disabled state. In this condition, the supply current drops to less than 2.8 mA , the output becomes a high impedance, and there is a high level of isolation from input to output. In the case of a line driver for example, the output impedance will be about the same as for a $1.5 \mathrm{k} \Omega$ resistor (the feedback plus gain resistors) in parallel with a 13 pF capacitor (due to the output) and the input to output isolation will be better than 65 dB at 1 M Hz .

Leaving the disable pin disconnected (floating) will leave the AD 810 operational in the enabled state.
In cases where the amplifier is driving a high impedance load, the input to output isolation will decrease significantly if the input signal is greater than about 1.2 V peak to peak. The isolation can be restored back to the 65 dB level by adding a dummy load (say $150 \Omega$ ) at the amplifier output. T his will attenuate the feedthrough signal. (This is not an issue for multiplexer applications where the outputs of multiple AD 810s are tied together as long as at least one channel is in the ON state.) T he input impedance of the disable pin is about $35 \mathrm{k} \Omega$ in parallel with a few pF . When grounded, about $50 \mu \mathrm{~A}$ flows out
of the disable the disable pin for $\pm 5 \mathrm{~V}$ supplies. If driven by complementary output CM OS logic (such as the 74H C 04), the disable time (until the output goes high impedance) is about 100 ns and the enable time (to low impedance output) is about 170 ns on $\pm 5 \mathrm{~V}$ supplies. The enable time can be extended to about 750 ns by using open drain logic such as the 74 HC 05.
When operated on $\pm 15 \mathrm{~V}$ supplies, the AD 810 disable pin may be driven by open drain logic such as the 74C 906. In this case, adding a $10 \mathrm{k} \Omega$ pull-up resistor from the disable pin to the plus supply will decrease the enable time to about 150 ns . If there is a nonzero voltage present on the amplifier's output at the time it is switched to the disabled state, some additional decay time will be required for the output voltage to relax to zero. The total time for the output to go to zero will generally be about 250 ns and is somewhat dependent on the load impedance.

## OPERATION AS A VIDEO LINE DRIVER

T he AD 810 is designed to offer outstanding performance at closed-loop gains of one or greater. At a gain of 2, the AD 810 makes an excellent video line driver. The low differential gain and phase errors and wide -0.1 dB bandwidth are nearly independent of supply voltage and load (as seen in Figures 49 and 50).

## AD810

## 2:1 VIDEO MULTIPLEXER

The outputs of two AD810s can be wired together to form a 2:1 mux without degrading the flatness of the gain response. Figure 54 shows a recommended configuration which results in -0.1 dB bandwidth of 20 M Hz and OFF channel isolation of 77 dB at 10 M Hz on $\pm 5 \mathrm{~V}$ supplies. The time to switch between channels is about $0.75 \mu \mathrm{~s}$ when the disable pins are driven by open drain output logic. Adding pull-up resistors to the logic outputs or using complementary output logic (such as the $74 \mathrm{HC} 04)$ reduces the switching time to about 180 ns . The switching time is only slightly affected by the signal level.

Figure 55. 2:1 Mux ON Channel Gain and Phase vs. Frequency

## N:1 MULTIPLEXER

A multiplexer of arbitrary size can be formed by combining the desired number of AD 810s together with the appropriate selection logic. The schematic in Figure 58 shows a recommendation for a 4:1 mux which may be useful for driving a high impedance such as the input to a video A/D converter (such as the AD773). The output series resistors effectively compensate for the combined output capacitance of the OFF channels plus the input capacitance of the A/D while maintaining wide bandwidth. In the case illustrated, the -0.1 dB bandwidth is about 20 M Hz with no peaking. Switching time and OFF channel isolation (for the 4:1 mux) are about 250 ns and 60 dB at 10 MHz , respectively.
