## SECAM-PAL Signal-Conversion IC

### ■ Overview

The AN5633K is an integrated circuit designed for conversion from SECAM color-signal to quasi-PAL color signal that is line-sequential 2-phase quadrature modulation.

### ■ Features

- Reduction of line-crawling by line-sequential detection (12dB as compared with the conventional one)
- SECAM/PAL discriminating capability is improved by detecting color killer voltage of PAL demodulation IC.
- Reduced external parts number like transformer, and adjustment processes

### • How to Adjust the AN5633K

After adjusting the AN5601K, adjust in the following procedure:

1. Set Pins⑪ and ⑯ to 0V and fix the SECAM mode.

a. Adjust the discriminating transformer between Pins⑮ and ⑯ and allow white (black) level DC to coincide.

b. Adjust the resistance volume between Pins⑮ and ⑯ and overlap the white level carrier.

c. Adjust the input capacitance of Pin⑯ and make the smallest amplitude of  $A_{CC}$  output Pin⑦ of the AN5601K.

Return Pins⑪ and ⑯ to the Auto mode

Pin⑪ in Auto	SECAM color	0V	Generated automatically in the AN5633K
	Other	up to 1V	
Pin⑯ in Auto	PAL color	1.5V or more	Get from the AN5601K
	PAL killer	0V
