and outputs and digital inputs are protected from electrostatic damage by diodes to $\mathrm{V}_{\mathrm{CC}}$ and ground.

## Features

- Typical switch enable time: 20 ns
- Wide analog input voltage range: $\pm 6 \mathrm{~V}$
- Low "ON" resistance:

50 typ. $\left(\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}=4.5 \mathrm{~V}\right) 30$ typ. $\left(\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}=9 \mathrm{~V}\right)$
■ Low quiescent current: $80 \mu \mathrm{~A}$ maximum ( 74 HC )

- Matched switch characteristics

■ Individual switch controls plus a common enable

## Ordering Code:

Pin Assignments for DIP, SOIC, SOP and TSSOP

Note 4: For a power supply of $5 \mathrm{~V} \pm 10 \%$ the worst case on resistances ( $\mathrm{R}_{\mathrm{ON}}$ ) occurs for HC at 4.5 V . Thus the 4.5 V values should be used when designing
with this supply. Worst case $\mathrm{V}_{I H}$ and $\mathrm{V}_{\mathrm{IL}}$ occur at $\mathrm{V}_{\mathrm{CC}}=5.5 \mathrm{~V}$ and 4.5 V respectively. (The $\mathrm{V}_{\mathrm{IH}}$ value at 5.5 V is 3.85 V .) The worst case leakage current occurs for CMOS at the higher voltage and so the 5.5 V values should be used
Note 5: At supply voltages $\left(\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}\right)$ approaching 2 V the analog switch on resistance becomes extremely non-linear. Therefore it is recommended that these devices be used to transmit digital only when using these supply voltages.

## Special Considerations

In certain applications the external load-resistor current may include both $\mathrm{V}_{\mathrm{CC}}$ and signal line components. To avoid drawing $\mathrm{V}_{\mathrm{CC}}$ current when switch current flows into
the analog switch input pins, the voltage drop across the switch must not exceed 0.6 V (calculated from the ON resis tance).

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
