DS90C032QML

LVDS Quad CMOS Differential Line Receiver

General Description

The DS90C032 is a quad CMOS differential line receiver designed for applications requiring ultra low power dissipation and high data rates.

The DS90C032 accepts low voltage differential input signals and translates them to CMOS (TTL compatible) output levels. The receiver supports a TRI-STATE® function that may be used to multiplex outputs. The receiver also supports OPEN Failsafe and terminated (100Ω) input Failsafe with the addition of external failsafe biasing. Receiver output will be HIGH for both Failsafe conditions.

The DS90C032 provides power-off high impedance LVDS inputs. This feature assures minimal loading effect on the LVDS bus lines when VCC is not present.

The DS90C032 and companion line driver (DS90C031) provide a new alternative to high power pseudo-ECL devices for high speed point-to-point interface applications.

Features

- Single Event Latchup (SEL) Immune   120 MeV-cm^2/mg
- High impedance LVDS inputs with power-off.
- Accepts small swing (330 mV) differential signal levels
- Low power dissipation.
- Low differential skew.
- Low chip to chip skew.
- Pin compatible with DS26C32A
- Compatible with IEEE 1596.3 SCI LVDS standard

t_{PHZ}	Disable Time High to Z	Input pulse = 0V to 3.0V, V_I = 1.5V, V_O = V_{OH}- 0.5V, R_L = 1KΩ to Gnd			20	ns	9, 10, 11

www.national.com

Symbol	Parameter	Conditions	Notes	Min	Max	Units	Sub-groups
t_{PZH}	Enable Time Z to High	Input pulse = 0V to 3.0V, V_I = 1.5V, V_O = 50%, R_L = 1KΩ to Gnd			20	ns	9, 10, 11
t_{PZL}	Enable Time Z to Low	Input pulse = 0V to 3.0V, V_I = 1.5V, V_O = 50%, R_L = 1KΩ to V_{CC}			20	ns	9, 10, 11

AC/DC Post Radiation Limits   (*Note 7*)

Symbol	Parameter	Conditions	Notes	Min	Max	Units	Sub-groups
I_{CC}	No Load Supply Current	EN, EN* = V_{CC} or Gnd, Inputs Open			20	mA	1
		EN, EN* = 2.4 or 0.5, Inputs Open			20	mA	1
I_{CCZ}	No Load Supply Current Receivers Disabled	EN = Gnd, EN* = V_{CC}, Inputs Open			20	mA	1

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 2: Derate LCC @ 12.2mW/°C above +25°C.   Derate ceramic flatpack @ 6.8mW/°C above +25°C

Note 3: Human body model, 1.5 kΩ in series with 100 pF.

Note 4: Tested during V_{OH} / V_{OL} tests.

Note 5: Channel-to-Channel Skew is defined as the difference between the propagation delay of one channel and that of the others on the same chip with an event on the inputs.

Note 6: Chip to Chip Skew is defined as the difference between the minimum and maximum specified differential propagation delays.

Note 7: Pre and post irradiation limits are identical to those listed under AC & DC electrical characteristics except as listed in the "Post Radiation Limits" table. Radiation end point limits for the noted parameters are guaranteed only for the conditions, as specified.

FIGURE 5. Point-to-Point Application

Applications Information

LVDS drivers and receivers are intended to be primarily used in an uncomplicated point-to-point configuration as is shown in *Figure 5*. This configuration provides a clean signaling environment for the quick edge rates of the drivers. The receiver is connected to the driver through a balanced media which may be a standard twisted pair cable, a parallel pair cable, or simply PCB traces. Typically the characteristic impedance of the media is in the range of 100Ω. A termination resistor of 100Ω should be selected to match the media, and is located as close to the receiver input pins as possible. The termination resistor converts the current sourced by the driver into a voltage that is detected by the receiver. Other configurations are possible such as a multi-receiver configuration, but the effects of a mid-stream connector(s), cable stub(s), and other impedance discontinuities as well as ground shifting, noise margin limits, and total termination loading must be taken into account.

The DS90C032 differential line receiver is capable of detecting signals as low as 100 mV, over a ±1V common-mode range centered around +1.2V. This is related to the driver offset voltage which is typically +1.2V. The driven signal is centered around this voltage and may shift ±1V around this center point. The ±1V shifting may be the result of a ground potential difference between the driver's ground reference and the receiver's ground reference, the common-mode effects of coupled noise, or a combination of the two. Both receiver input pins should honor their specified operating input voltage range of 0V to +2.4V (measured from each pin to

ground), exceeding these limits may turn on the ESD protection circuitry which will clamp the bus voltages.

Receiver Failsafe

The LVDS receiver is a high gain, high speed device that amplifies a small differential signal (20mV) to CMOS logic levels. Due to the high gain and tight threshold of the receiver, care should be taken to prevent noise from appearing as a valid signal.

The receiver's internal failsafe circuitry is designed to source/sink a small amount of current, providing failsafe protection (a stable known state of HIGH output voltage) for floating and terminated (100Ω) receiver inputs in low noise environment (differential noise < 10mV).

1. Open Input Pins

TheDS90C032 is a quad receiver device, and if an application requires only 1, 2 or 3 receivers, the unused channel(s) inputs should be left OPEN. Do not tie unused receiver inputs to ground or any other voltages. The input is biased by internal high value pull up and pull down resistors to set the output to a HIGH state. This internal circuitry will guarantee a HIGH, stable output state for open inputs.

2. Terminated Input

The DS90C032 requires external failsafe biasing for terminated input failsafe.

Terminated input failsafe is the case of a receiver that has a 100Ω termination across its inputs and the driver is in the following situations. Unplugged from the bus, or the driver output

is in TRI-STATE or in power-off condition. The use of external biasing resistors provide a small bias to set the differential input voltage while the line is un-driven, and therefore the receiver output will be in HIGH state. If the driver is removed from the bus but the cable is still present and floating, the unplugged cable can become a floating antenna that can pick up noise. The LVDS receiver is designed to detect very small amplitude and width signals and recover them to standard logic levels. Thus, if the cable picks up more than 10mV of differential noise, the receiver may respond. To insure that any noise is seen as commonmode and not differential, a balanced interconnect and twisted pair cables is recommended, as they help to ensure that noise is coupled common to both lines and rejected by the receivers.

3. Operation in environment with greater than 10mV differential noise

National recommends external failsafe biasing on its LVDS receivers for a number of system level and signal quality rea-

sons. First, only an application that requires failsafe biasing needs to employ it. Second, the amount of failsafe biasing is now an application design parameter and can be custom tailored for the specific application. In applications in low noise environments, they may choose to use a very small bias if any. For applications with less balanced interconnects and/or in high noise environments they may choose to boost failsafe further. Nationals "LVDS Owner's Manual provides detailed calculations for selecting the proper failsafe biasing resistors. Third, the common-mode voltage is biased by the resistors during the un-driven state. This is selected to be close to the nominal driver offset voltage (VOS). Thus when switching between driven and un-driven states, the common-mode modulation on the bus is held to a minimum.

For additional Failsafe Biasing information, please refer to Application Note AN-1194 for more detail.

Pin Descriptions

Pin No. (SOIC)	Name	Description
2, 6, 10, 14	R_{I+}	Non-inverting receiver input pin
1, 7, 9, 15	R_{I-}	Inverting receiver input pin
3, 5, 11, 13	R_O	Receiver output pin
4	EN	Active high enable pin, OR-ed with EN*
12	EN*	Active low enable pin, OR-ed with EN
16	V_{CC}	Power supply pin, +5V ± 10%
8	Gnd	Ground pin

Radiation Environments

Careful consideration should be given to environmental conditions when using a product in a radiation environment.

Total Ionizing Dose

Radiation hardness assured (RHA) products are those part numbers with a total ionizing dose (TID) level specified in the Ordering Information table on the front page. Testing and qualification of these products is done on a wafer level according to MIL-STD-883G, Test Method 1019.7, Condition A and the "Extended room temperature anneal test" described in section 3.11 for application environment dose rates less than 0.19 rad(Si)/s. Wafer level TID data is available with lot shipments.

Single Event Latch-Up and Functional Interrupt

One time single event latch-up (SEL) and single event functional interrupt (SEFI) testing was preformed according to EIA/JEDEC Standard, EIA/JEDEC57. The linear energy transfer threshold (LETth) shown in the Features on the front page is the maximum LET tested. A test report is available upon request.
Single Event Upset

A report on single event upset (SEU) is available upon request.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
