

CY7C198

32K x 8 Static RAM

Features

- **High speed**
— 15 ns
- **CMOS for optimum speed/power**
- **Low active power**
— 990 mW
- **Low standby power**
— 195 mW
- **Easy memory expansion with \overline{CE} and \overline{OE} features**
- **TTL-compatible inputs and outputs**
- **Automatic power-down when deselected**

Functional Description

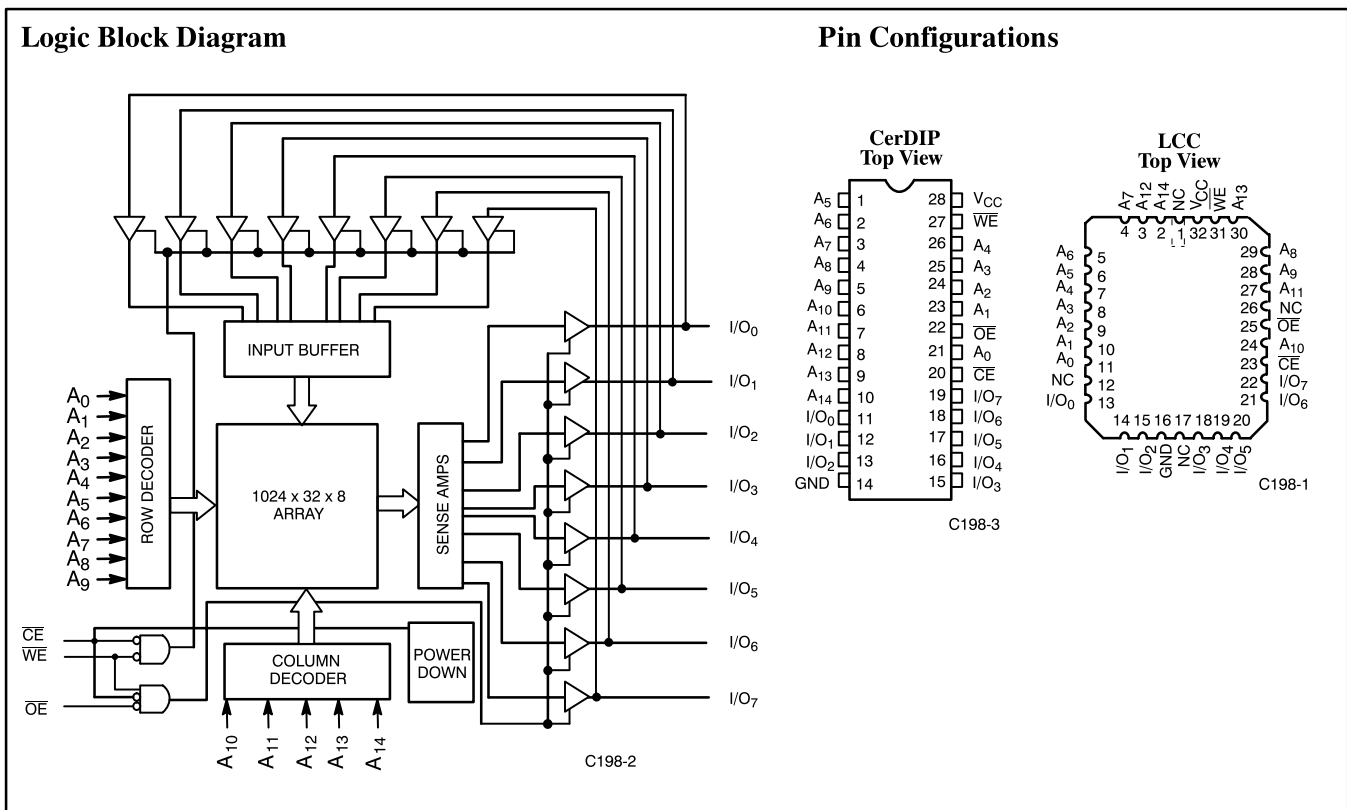

The CY7C198 is a high-performance CMOS static RAM organized as 32,768 words by 8 bits. Easy memory expansion is provided by an active LOW chip enable (\overline{CE}) and active LOW output enable (\overline{OE}) and three-state drivers. This device has an automatic power-down feature, reducing the power consumption by 80% when deselected. The CY7C198 is available in a 600-mil-wide cerDIP and LCC package and a 32-lead TSOP package.

An active LOW write enable signal (\overline{WE}) controls the writing/reading operation of the memory. When \overline{CE} and \overline{WE} inputs are both LOW, data on the eight data input/

output pins (I/O_0 through I/O_7) is written into the memory location addressed by the address present on the address pins (A_0 through A_{14}). Reading the device is accomplished by selecting the device and enabling the outputs, \overline{CE} and \overline{OE} active LOW, while \overline{WE} remains inactive or HIGH. Under these conditions, the contents of the location addressed by the information on address pins is present on the eight data input/output pins.

The input/output pins remain in a high-impedance state unless the chip is selected, outputs are enabled, and write enable (\overline{WE}) is HIGH.

A die coat is used to ensure alpha immunity.

Selection Guide

	7C198-15	7C198-20	7C198-25	7C198-35	7C198-45
Maximum Access Time (ns)	15	20	25	35	45
Maximum Operating Current (mA)	Commercial	150			
	Military	180	170	150	150
Maximum Standby Current (mA)	30	30	30	25	25

Shaded area contains preliminary information.

Pin Configurations (continued)

C198-4

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

- Storage Temperature -65°C to +150°C
- Ambient Temperature with Power Applied -55°C to +125°C
- Supply Voltage to Ground Potential (Pin 28 to Pin 14) -0.5V to +7.0V
- DC Voltage Applied to Outputs in High Z State^[15] -0.5V to V_{CC} + 0.5V
- DC Input Voltage^[15] -0.5V to V_{CC} + 0.5V
- Output Current into Outputs (LOW) 20 mA

Static Discharge Voltage >2001V
 (per MIL-STD-883, Method 3015)

Latch-Up Current >200 mA

Operating Range

Range	Ambient Temperature	V _{CC}
Commercial	0°C to +70°C	5V ± 10%
Military ^[16]	-55°C to +125°C	5V ± 10%

Notes:

- 15. V_{IL} (min.) = -2.0V for pulse durations less than 20 ns.
- 16. T_A is the “instant on” case temperature.

Capacitance^[19]

Parameter	Description	Test Conditions	Max.	Unit
C _{IN}	Input Capacitance	T _A = 25°C, f = 1 MHz, V _{CC} = 5.0V	10	pF
C _{OUT}	Output Capacitance		10	pF

Notes:

- 17. See the last page of this specification for Group A subgroup testing information.
- 18. Not more than one output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.
- 19. Tested initially and after any design or process changes that may affect these parameters.

Shaded area contains preliminary information.

Notes:

- 20 t_r ≥ 3 ns for the 15-ns and 20-ns speeds, t_r ≥ 5 ns for the 20-ns and slower speeds.
- 21. Test conditions assume signal transition time of 3 ns or less for the 12-ns and 15-ns speeds and 5 ns for the 20-ns and slower speeds, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- 22. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any given device.
- 23. t_{HZOE}, t_{HZCE}, and t_{HZWE} are specified with C_L = 5 pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady-state voltage.
- 24. The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
- 25. The minimum write cycle time for write cycle #3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD}.

C198-9

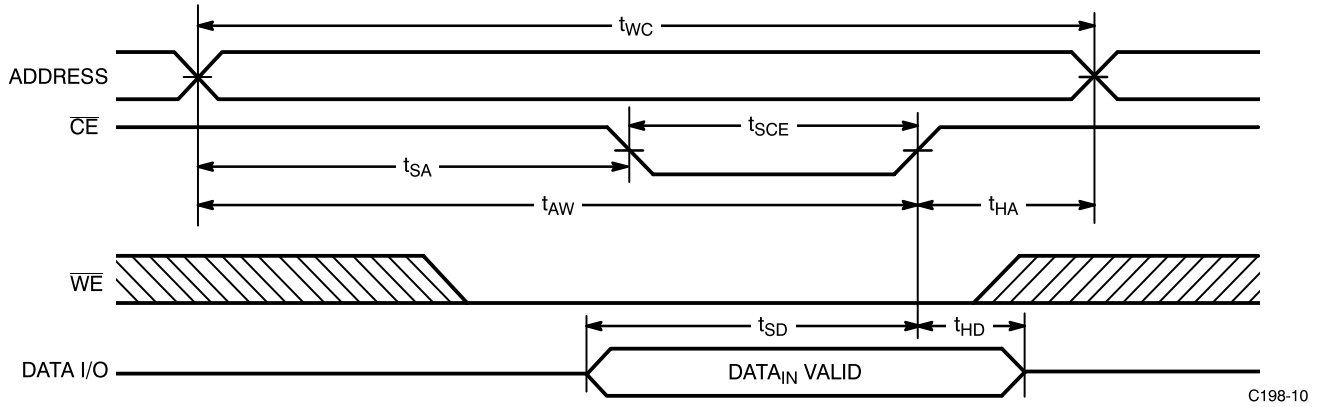

Notes:

- 26. Device is continuously selected. $\overline{OE}, \overline{CE} = V_{IL}$.
- 27. \overline{WE} is HIGH for read cycle.
- 28. Address valid prior to or coincident with \overline{CE} transition LOW.
- 29. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
- 30. If \overline{CE} goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.
