100336
Low Power 4-Stage Counter/Shift Register

General Description

The 100336 operates as either a modulo-16 up/down counter or as a 4-bit bidirectional shift register. Three Select (S_n) inputs determine the mode of operation, as shown in the Function Select table. Two Count Enable ($\overline{CEP}$, $\overline{CET}$) inputs are provided for ease of cascading in multistage counters. One Count Enable ($\overline{CET}$) input also doubles as a Serial Data (D_0) input for shift-up operation. For shift-down operation, D_3 is the Serial Data input. In counting operations the Terminal Count ($\overline{TC}$) output goes LOW when the counter reaches 15 in the count/up mode or 0 (zero) in the count/down mode. In the shift modes, the $\overline{TC}$ output repeats the Q_3 output. The dual nature of this $\overline{TC}/Q_3$ output and the $D_0/\overline{CET}$ input means that one interconnection from one stage to the next higher stage serves as the link for multistage counting or shift-up operation. The individual Preset (P_n) inputs are used to enter data in parallel or to preset the counter in programmable counter applications. A HIGH signal on the Master Reset (MR) input overrides all other inputs and asynchronously clears the flip-flops. In addition, a synchronous clear is provided, as well as a complement function which synchronously inverts the contents of the flip-flops. All inputs have 50 kΩ pull-down resistors.

Features

- 40% power reduction of the 100136
- 2000V ESD protection
- Pin/function compatible with 100136
- Voltage compensated operating range = –4.2V to –5.7V
- Available to industrial grade temperature range

Note 4: The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.

Note 7: Output-to-Output Skew is defined as the absolute value of the difference between the actual propagation delay for any outputs within the same packaged device. The specifications apply to any outputs switching in the same direction either HIGH-to-LOW (t_{OSHL}), or LOW-to-HIGH (t_{OSLH}), or in opposite directions both HL and LH (t_{OST}). Parameters t_{OST} and t_{ps} guaranteed by design
