

## Unit Loading/Fan Out

| Pin Names | Description | U.L. <br> HIGH/LOW | $\operatorname{Input} \mathbf{I}_{\mathbf{I H}} / \mathbf{I}_{\mathbf{I L}}$ <br> Output $\mathbf{I}_{\mathbf{O H}} / \mathbf{I}_{\mathbf{O L}}$ |
| :--- | :--- | :---: | :---: |
| $\overline{\mathrm{CE}}$ | Count Enable Input (Active LOW) | $1.0 / 3.0$ | $20 \mu \mathrm{~A} /-1.8 \mathrm{~mA}$ |
| CP | Clock Pulse Input (Active Rising Edge) | $1.0 / 1.0$ | $20 \mu \mathrm{~A} /-0.6 \mathrm{~mA}$ |
| $\mathrm{P}_{0}-\mathrm{P}_{3}$ | Parallel Data Inputs | $1.0 / 1.0$ | $20 \mu \mathrm{~A} /-0.6 \mathrm{~mA}$ |
| $\overline{\mathrm{PL}}$ | Asynchronous Parallel Load Input (Active LOW) | $1.0 / 1.0$ | $20 \mu \mathrm{~A} /-0.6 \mathrm{~mA}$ |
| $\overline{\mathrm{U}} / \mathrm{D}$ | Up/Down Count Control Input | $1.0 / 1.0$ | $20 \mu \mathrm{~A} /-0.6 \mathrm{~mA}$ |
| $\mathrm{Q}_{0}-\mathrm{Q}_{3}$ | Flip-Flop Outputs | $50 / 33.3$ | $-1 \mathrm{~mA} / 20 \mathrm{~mA}$ |
| $\overline{R C}$ | Ripple Clock Output (Active LOW) | $50 / 33.3$ | $-1 \mathrm{~mA} / 20 \mathrm{~mA}$ |
| TC | Terminal Count Output (Active HIGH) | $50 / 33.3$ | $-1 \mathrm{~mA} / 20 \mathrm{~mA}$ |

## Functional Description

The 74F191 is a synchronous up/down 4-bit binary counter. It contains four edge-triggered flip-flops, with internal gating and steering logic to provide individual preset, count-up and count-down operations.
Each circuit has an asynchronous parallel load capability permitting the counter to be preset to any desired number. When the Parallel Load (PL) input is LOW, information present on the Parallel Data inputs $\left(\mathrm{P}_{0}-\mathrm{P}_{3}\right)$ is loaded into the counter and appears on the Q outputs. This operation overrides the counting functions, as indicated in the Mode Select Table.
A HIGH signal on the $\overline{\mathrm{CE}}$ input inhibits counting. When $\overline{\mathrm{CE}}$ is LOW, internal state changes are initiated synchronously by the LOW-to-HIGH transition of the clock input. The direction of counting is determined by the $\mathrm{U} / \mathrm{D}$ input signal, as indicated in the Mode Select Table. $\overline{\mathrm{CE}}$ and $\overline{\mathrm{U}} / \mathrm{D}$ can be changed with the clock in either state, provided only that the recommended setup and hold times are observed.

Two types of outputs are provided as overflow/underflow indicators. The Terminal Count (TC) output is normally LOW and goes HIGH when a circuit reaches zero in the count-down mode or reaches 15 in the count-up mode. The TC output will then remain HIGH until a state change occurs, whether by counting or presetting or until $\overline{\mathrm{U}} / \mathrm{D}$ is changed. The TC output should not be used as a clock signal because it is subject to decoding spikes.
The TC signal is also used internally to enable the Ripple Clock ( $\overline{\mathrm{RC}}$ ) output. The $\overline{\mathrm{RC}}$ output is normally HIGH. When $\overline{\mathrm{CE}}$ is LOW and TC is HIGH, the $\overline{\mathrm{RC}}$ output will go LOW when the clock next goes LOW and will stay LOW until the clock goes HIGH again. This feature simplifies the design of multistage counters, as indicated in Figure 1 and Figure 2. In Figure 1, each $\overline{\mathrm{RC}}$ output is used as the clock input for the next higher stage. This configuration is particularly advantageous when the clock source has a limited drive capability, since it drives only the first stage. To prevent counting in all stages it is only necessary to inhibit the first stage, since a HIGH signal on CE inhibits the RC output pulse, as indicated in the $\overline{\mathrm{RC}}$ Truth Table. A disadvantage of this configuration, in some applications, is the timing skew between state changes in the first and last stages. This represents the cumulative delay of the clock as it ripples through the preceding stages.
A method of causing state changes to occur simultaneously in all stages is shown in Figure 2. All clock inputs are driven in parallel and the $\overline{\mathrm{RC}}$ outputs propagate the carry/borrow signals in ripple fashion. In this configuration
the LOW state duration of the clock must be long enough to allow the negative-going edge of the carry/borrow signal to ripple through to the last stage before the clock goes HIGH. There is no such restriction on the HIGH state duration of the clock, since the $\overline{\mathrm{RC}}$ output of any device goes HIGH shortly after its CP input goes HIGH.
The configuration shown in Figure 3 avoids ripple delays and their associated restrictions. The $\overline{\mathrm{CE}}$ input for a given stage is formed by combining the TC signals from all the preceding stages. Note that in order to inhibit counting an enable signal must be included in each carry gate. The simple inhibit scheme of Figure 1 and Figure 2 doesn't apply, because the TC output of a given stage is not affected by its own CE.

## Mode Select Table

| Inputs |  |  |  | Mode |  |
| :---: | :---: | :---: | :---: | :--- | :---: |
| $\overline{\mathbf{P L}}$ | $\overline{\mathbf{C E}}$ | $\overline{\mathbf{U}} / \mathbf{D}$ | $\mathbf{C P}$ |  |  |
| H | L | L | - | Count Up |  |
| H | L | H | - | Count Down |  |
| L | X | X | X | Preset (Asyn.) |  |
| H | H | X | X | No Change (Hold) |  |

## RC Truth Table

| Inputs |  |  | Output |
| :---: | :---: | :---: | :---: |
| $\overline{\mathbf{C E}}$ | TC* | CP | $\overline{\mathrm{RC}}$ |
| L | H | ㄷ | บ |
| H | X | X | H |
| X | L | X | H |

TC is generated internal
H = HIGH Voltage Level
L = LOW Voltage Level
X = Immaterial
= LOW-to-HIGH Clock Transition
ㄷ = LOW Pulse

| Absolute Maximum Rating $\mathbf{S}$ (Note 1 ) |  |
| :--- | ---: |
| Storage Temperature | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Ambient Temperature under Bias | $-5^{\circ} \mathrm{Co}$ to $+125^{\circ} \mathrm{C}$ |
| Junction Temperature under Bias | $-55^{\circ} \mathrm{Co}$ to $+150^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\mathrm{CC}}$ Pin Potentiat to Ground Pin | -0.5 V to +7.0 V |
| Input Votage (Note 2) | -.5 V to +7.0 V |
| Input Current (Note 2) | -30 mA to +5.0 mA | Voltage Applied to Output

| in HIGH State (with $\mathrm{V}_{\mathrm{CC}}=0 \mathrm{~V}$ ) |  |
| :--- | ---: |
| Standard Output | -0.5 V to $\mathrm{V}_{\mathrm{CC}}$ |
| 3-STATE Output | -0.5 V to +5.5 V |

## Recommended Operating Conditions

| Free Air Ambient Temperature | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |
| :--- | ---: |
| Supply Voltage | +4.5 V to +5.5 V |

Note 1: Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied
Note 2: Either voltage limit or current limit is sufficient to protect inputs.
Current Applied to Output
in LOW State (Max)
twice the rated $\mathrm{I}_{\mathrm{OL}}(\mathrm{mA})$

Fairchild does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and Fairchild reserves the right at any time without notice to change said circuitry and specifications.
LIFE SUPPORT POLICY
FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
