Functional Description

The CY62157CV25/30/33 are high-performance CMOS static RAMs organized as 512K words by 16 bits. These devices feature advanced circuit design to provide ultra-low active current. This is ideal for providing More Battery Life™ (MoBL™) in portable applications such as cellular telephones. The devices also have an automatic power-down feature that significantly reduces power consumption by 80% when addresses are not toggling. The device can also be put into standby mode

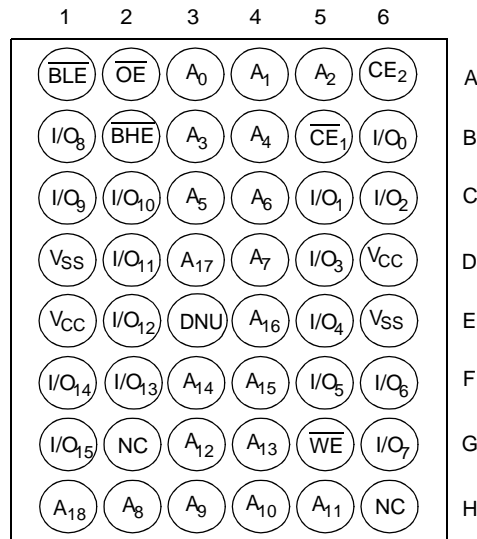

reducing power consumption by more than 99% when deselected (\overline{CE}_1 HIGH or \overline{CE}_2 LOW or both \overline{BLE} and \overline{BHE} are HIGH). The input/output pins (I/O_0 through I/O_{15}) are placed in a high-impedance state when: deselected (\overline{CE}_1 HIGH or \overline{CE}_2 LOW), outputs are disabled (\overline{OE} HIGH), both Byte High Enable and Byte Low Enable are disabled (\overline{BHE} , \overline{BLE} HIGH), or during a write operation (\overline{CE}_1 LOW and \overline{CE}_2 HIGH and \overline{WE} LOW).

Writing to the device is accomplished by taking Chip Enable 1 (\overline{CE}_1) and Write Enable (\overline{WE}) inputs LOW and Chip Enable 2 (\overline{CE}_2) HIGH. If Byte Low Enable (\overline{BLE}) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{18}). If Byte High Enable (\overline{BHE}) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{18}).

Reading from the device is accomplished by taking Chip Enable 1 (\overline{CE}_1) and Output Enable (\overline{OE}) LOW and Chip Enable 2 (\overline{CE}_2) HIGH while forcing the Write Enable (\overline{WE}) HIGH. If Byte Low Enable (\overline{BLE}) is LOW, then data from the memory location specified by the address pins will appear on I/O_0 to I/O_7 . If Byte High Enable (\overline{BHE}) is LOW, then data from memory will appear on I/O_8 to I/O_{15} . See the truth table at the back of this data sheet for a complete description of read and write modes.

The CY62157CV25/30/33 are available in a 48-ball FBGA package.

Notes:

8. Test conditions assume signal transition time of 5 ns or less, timing reference levels of $V_{CC(typ.)}/2$, input pulse levels of 0 to $V_{CC(typ.)}$, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
9. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
10. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high-impedance state.
11. When both byte enables are toggled together this value is 10 ns.
12. The internal Write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} and/or $\overline{BLE} = V_{IL}$, $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a Write and any of these signals can terminate a Write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the Write.

Switching Waveforms
Read Cycle No. 1 (Address Transition Controlled)^[13, 14]

Read Cycle No. 2 (\overline{OE} Controlled)^[14, 15]

Notes:

13. Device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} and/or $\overline{BLE} = V_{IL}$, $\overline{CE}_2 = V_{IH}$.
14. \overline{WE} is HIGH for Read cycle.
15. Address valid prior to or coincident with \overline{CE}_1 , \overline{BHE} , \overline{BLE} transition LOW and \overline{CE}_2 transition HIGH.

Switching Waveforms (continued)
Write Cycle No. 1 ($\overline{\text{WE}}$ Controlled) [12, 16, 17]

Write Cycle No. 2 ($\overline{\text{CE}}_1$ or $\overline{\text{CE}}_2$ Controlled) [12, 16, 17]

Notes:

16. Data I/O is high-impedance if $\overline{\text{OE}} = V_{IH}$.
17. If $\overline{\text{CE}}_1$ goes HIGH or $\overline{\text{CE}}_2$ goes LOW simultaneously with $\overline{\text{WE}}$ HIGH, the output remains in a high-impedance state.
18. During this period, the I/Os are in output state and input signals should not be applied.

Switching Waveforms (continued)
Write Cycle No. 3 (\overline{WE} Controlled, \overline{OE} LOW)^[17]

Write Cycle No. 4 ($\overline{BHE}/\overline{BLE}$ Controlled, \overline{OE} LOW)^[17]
