

# FPAL20SM60

## **Smart Power Module (SPM)**

### **General Description**

FPAL20SM60 is an advanced smart power module (SPM) that Fairchild has newly developed and designed to provide very compact and low cost, yet high performance ac motor drives mainly targeting medium speed low-power inverterdriven application like air conditioners. It combines optimized circuit protection and drive matched to low-loss IGBTs. Highly effective short-circuit current detection/ protection is realized through the use of advanced current sensing IGBT chips that allow continuous monitoring of the IGBTs current. System reliability is further enhanced by the built-in over-temperature and integrated under-voltage lock-out protection. The high speed built-in HVIC provides opto-coupler-less IGBT gate driving capability that further reduce the overall size of the inverter system design. In addition the incorporated HVIC facilitates the use of singlesupply drive topology enabling the FPAL20SM60 to be driven by only one drive supply voltage without negative

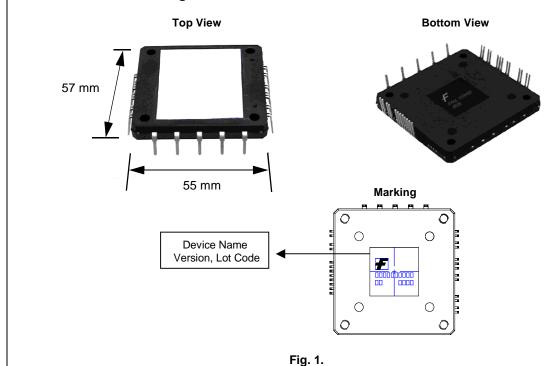

### **Features**

- UL Certified No. E209204
- 600V-20A 3-phase IGBT inverter bridge including control ICs for gate driving and protection
- Single-grounded power supply due to built-in HVIC
- · Typical switching frequency of 7kHz
- Built-in thermistor for over-temperature monitoring
- Inverter power rating of 1.4kW / 100~253 Vac
- Isolation rating of 2500Vrms/min.
- Very low leakage current due to using ceramic substrate
- Adjustable current protection level by varying series resistor value with sense-IGBTs

### **Applications**

- AC 100V ~ 253V three-phase inverter drive for small power (1.4kW) ac motor drives
- Home appliances applications requiring medium switching frequency operation like air conditioners drive system
- · Application ratings:
  - Power: 1.4 kW / 100~253 Vac
  - Switching frequency: Typical 7kHz (PWM Control)
  - 100% load current: 10A (Irms)

### **External View and Marking Information**

Rev. B, February 2002

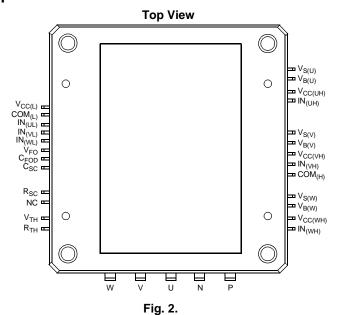

# **Integrated Power Functions**

• 600V-20A IGBT inverter for three-phase DC/AC power conversion (Please refer to Fig. 3)

## **Integrated Drive, Protection and System Control Functions**

- For inverter high-side IGBTs: Gate drive circuit, High voltage isolated high-speed level shifting Control circuit under-voltage (UV) protection Note) Available bootstrap circuit example is given in Figs. 11, 16 and 17.
- For inverter low-side IGBTs: Gate drive circuit, Short circuit protection (SC) Control supply circuit under-voltage (UV) protection
- Temperature Monitoring: System over-temperature monitoring using built-in thermistor Note) Available temperature monitoring circuit is given in Fig. 17.
- Fault signaling: Corresponding to a SC fault (Low-side IGBTs) or a UV fault (Low-side supply)
- Input interface: 5V CMOS/LSTTL compatible, Schmitt trigger input

# **Pin Configuration**

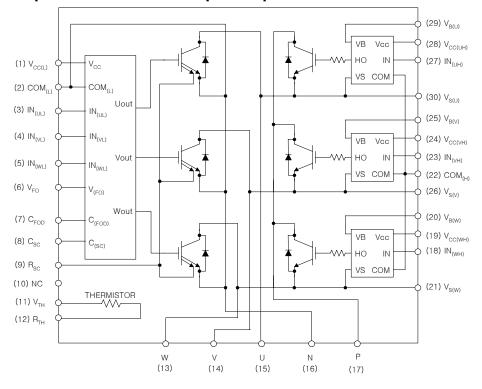

## **Pin Descriptions**

| Pin Number | Pin Name           | Pin Description   |  |  |  |
|------------|--------------------|---|--|--|--|
| 1          | V <sub>CC(L)</sub> | Low-side Common Bias Voltage for IC and IGBTs Driving             |  |  |  |
| 2          | COM <sub>(L)</sub> | Low-side Common Supply Ground                                     |  |  |  |
| 3          | IN <sub>(UL)</sub> | Signal Input Terminal for Low-side U Phase                        |  |  |  |
| 4          | IN <sub>(VL)</sub> | Signal Input Terminal for Low-side V Phase                        |  |  |  |
| 5          | IN <sub>(WL)</sub> | Signal Input Terminal for Low-side W Phase                        |  |  |  |
| 6          | V <sub>FO</sub>    | Fault Output Terminal   |  |  |  |
| 7          | C <sub>FOD</sub>   | Capacitor for Fault Output Duration Time Selection                |  |  |  |
| 8          | C <sub>SC</sub>    | Capacitor (Low-pass Filter) for Short-current Detection Input     |  |  |  |
| 9          | R <sub>SC</sub>    | Resistor for Short-circuit Current Detection                      |  |  |  |
| 10         | NC                 | NO Connection   |  |  |  |
| 11         | V <sub>TH</sub>    | Thermistor Bias Voltage   |  |  |  |
| 12         | R <sub>TH</sub>    | Series Resistor for the Use of Thermistor (Temperature Detection) |  |  |  |
| 13         | W                  | Output Terminal for W Phase                                       |  |  |  |
| 14         | V                  | Output Terminal for V Phase                                       |  |  |  |
| 15         | U                  | Output Terminal for U Phase                                       |  |  |  |

# Pin Descriptions (Continued)

| Pin Number | Pin Name            | Pin Description  |  |  |  |
|------------|---------------------|--|--|--|--|
| 16         | N                   | Negative DC-Link Input                                 |  |  |  |
| 17         | Р                   | Positive DC-Link Input                                 |  |  |  |
| 18         | IN <sub>(WH)</sub>  | Signal Input Terminal for High-side W Phase            |  |  |  |
| 19         | V <sub>CC(WH)</sub> | High-side Bias Voltage for W Phase IC                  |  |  |  |
| 20         | V <sub>B(W)</sub>   | High-side Bias Voltage for W Phase IGBT Driving        |  |  |  |
| 21         | V <sub>S(W)</sub>   | High-side Bias Voltage Ground for W Phase IGBT Driving |  |  |  |
| 22         | COM <sub>(H)</sub>  | High-side Common Supply Ground                         |  |  |  |
| 23         | IN <sub>(VH)</sub>  | Signal Input Terminal for High-side V Phase            |  |  |  |
| 24         | V <sub>CC(VH)</sub> | High-side Bias Voltage for V Phase IC                  |  |  |  |
| 25         | V <sub>B(V)</sub>   | High-side Bias Voltage for V Phase IGBT Driving        |  |  |  |
| 26         | V <sub>S(V)</sub>   | High-side Bias Voltage Ground for V Phase IGBT Driving |  |  |  |
| 27         | IN <sub>(UH)</sub>  | Signal Input Terminal for High-side U Phase            |  |  |  |
| 28         | V <sub>CC(UH)</sub> | High-side Bias Voltage for U Phase IC                  |  |  |  |
| 29         | V <sub>B(U)</sub>   | ligh-side Bias Voltage for U Phase IGBT Driving        |  |  |  |
| 30         | V <sub>S(U)</sub>   | High-side Bias Voltage Ground for U Phase IGBT Driving |  |  |  |

# **Internal Equivalent Circuit and Input/Output Pins**

- Note

  1. Inverter low-side ( (1) (12) pins) is composed of three sense-IGBTs including freewheeling diodes for each IGBT and one control IC which has gate driving, current sensing and protection functions.

  2. Inverter power side ( (13) – (17) pins) is composed of two inverter dc-link input terminals and three inverter output terminals.

  3. Inverter high-side ( (18) – (30) pins) is composed of three normal-IGBTs including freewheeling diodes and three drive ICs for each IGBT.

Fig. 3.

# **Absolute Maximum Ratings**

**Inverter Part** (T<sub>C</sub> = 25°C, Unless Otherwise Specified)

| Item                               | Symbol                 | Condition                           | Rating    | Unit |
|------------------------------------|------------------------|-------------------------------------|-----------|------|
| Supply Voltage                     | $V_{DC}$               | Applied to DC - Link                | 450       | V    |
| Supply Voltage (Surge)             | V <sub>PN(Surge)</sub> | Applied between P- N                | 500       | V    |

| Resistance of Thermistor                                       | R <sub>TH</sub>      | @ T <sub>C</sub> = 25°C (Note F   | igs. 4 and 7)  | -    | 50   | -    | kΩ   |
|  |                      | @ T <sub>C</sub> = 80°C (Note F   | igs. 4 and 7)  | -    | 6.3  | -    | kΩ   |

Note
 Short-circuit current protection is functioning only at the low-sides. It would be recommended that the value of the external sensing resistor (R<sub>SC</sub>) should be selected around 56 Ω in order to make the SC trip-level of about 30A. Please refer to Fig. 8 which shows the current sensing characteristics according to sensing resistor R<sub>SC</sub>.
 The fault-out pulse width t<sub>FOD</sub> depends on the capacitance value of C<sub>FOD</sub> according to the following approximate equation: C<sub>FOD</sub> = 18.3 x 10<sup>-6</sup> x t<sub>FOD</sub>[F]

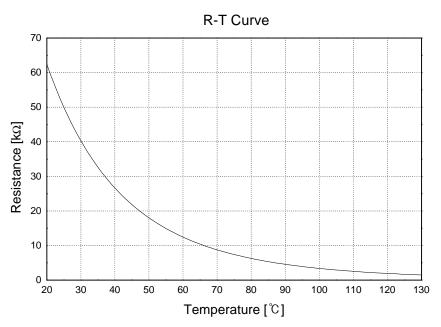

Fig. 7. R-T Curve of The Built-in Thermistor

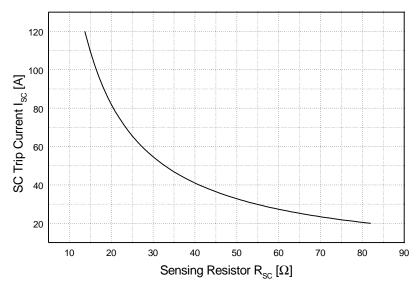

Fig. 8. Relationship between Sensing Resistor and SC Trip Current for Short-Circuit Protection ( $I_{SC} = 82 \times Rating Current(20A) / R_{SC}$ )

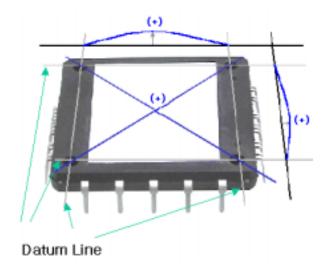

Fig. 9. Flatness Measurement Position of The Ceramic Substrate

- 6. Do not make over torque or mounting screws. Much mounting torque may cause ceramic cracks and bolts and AI heat-fin destruction.

  7. Avoid one side tightening stress. Fig.10 shows the recommended torque order for mounting screws. Uneven mounting can cause the SPM ceramic substrate to be damaged.

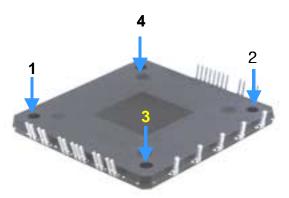

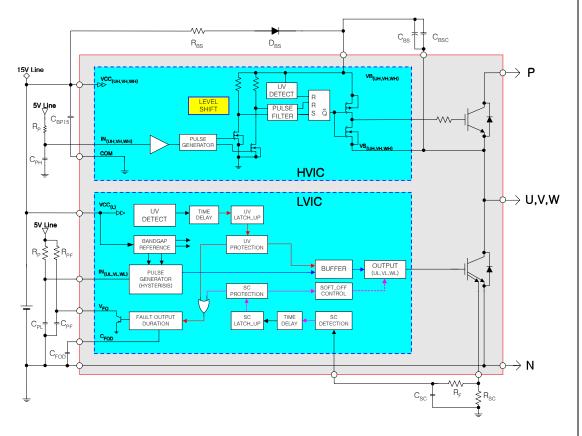

Fig. 10. Mounting Screws Torque Order  $(1 \rightarrow 2 \rightarrow 3 \rightarrow 4)$

## **ICs Internal Structure and Input/Output Conditions**

- Note
  1. One LVIC drives three Sense-IGBTs and can do short-circuit current protection also. Three sense emitters are commonly connected to R<sub>SC</sub> terminal to detect

- short-circuit current. Low-side part of the inverter consists of three sense-IGBTs

  One HVIC drives one normal-IGBT. High-side part of the inverter consists of three normal-IGBTs

  Each IC has under voltage detection and protection function.

  The logic input is compatible with standard CMOS or LSTTL outputs.

  R<sub>P</sub>C<sub>P</sub> coupling at each input/output is recommended in order to prevent the gating input/output signals oscillation and it should be as close as possible to each SPM gating input pin.
- It would be recommended that the bootstrap diode, D<sub>BS</sub>, has soft and fast recovery characteristics.

Fig. 11.

## **Time Charts of SPMs Protective Function**

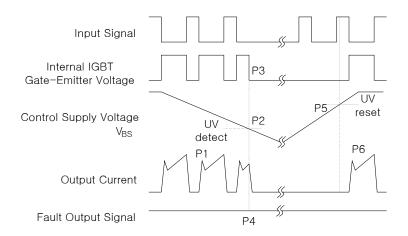

P1: Normal operation - IGBT ON and conducting current

P2 : Under voltage detection P3 : IGBT gate interrupt P4 : Fault signal generation P5 : Under voltage reset

P6: Normal operation - IGBT ON and conducting current

Fig. 12. Under-Voltage Protection (Low-side)

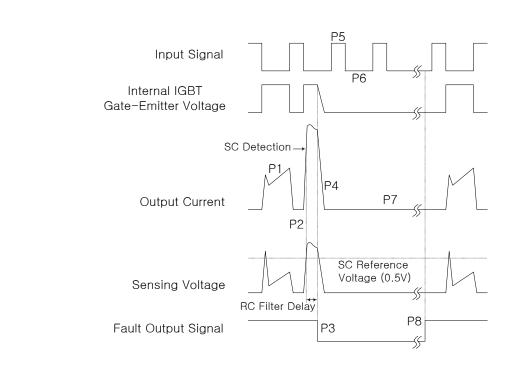

P1: Normal operation - IGBT ON and conducting current

P2 : Under voltage detection P3 : IGBT gate interrupt P4 : No fault signal P5 : Under voltage reset

P6: Normal operation - IGBT ON and conducting current

Fig. 13. Under-Voltage Protection (High-side)

P1: Normal operation - IGBT ON and conducting currents

P2 : Short-circuit current detection

P3: IGBT gate interrupt / Fault signal generation

P4: IGBT is slowly turned off

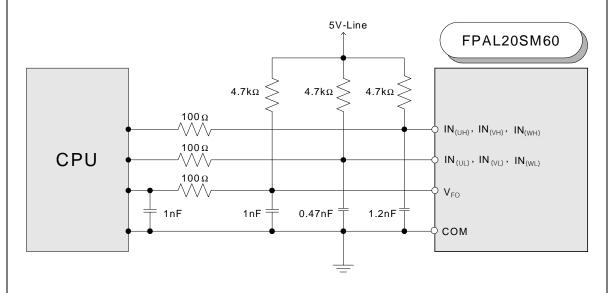

P5: IGBT OFF signal

P6: IGBT ON signal - but IGBT cannot be turned on during the fault-output activation

P7: IGBT OFF state

P8: Fault-output reset and normal operation start

Fig. 14. Short-circuit Current Protection (Low-side Operation only)

It would be recommended that by-pass capacitors for the gating input signals, IN(XX) should be placed on the SPM pins and on the both sides of CPU and SPM for the fault output signal, V<sub>FO</sub>, as close as possible.

Fig. 15. Recommended CPU I/O Interface Circuit

©2002 Fairchild Semiconductor Corporation

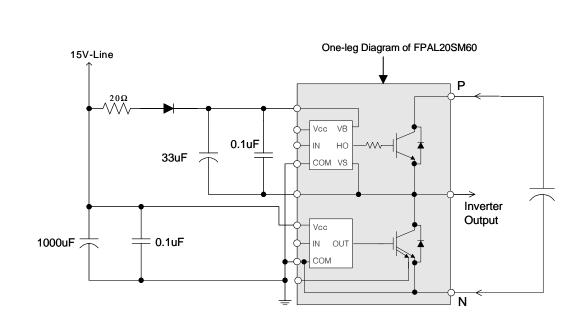

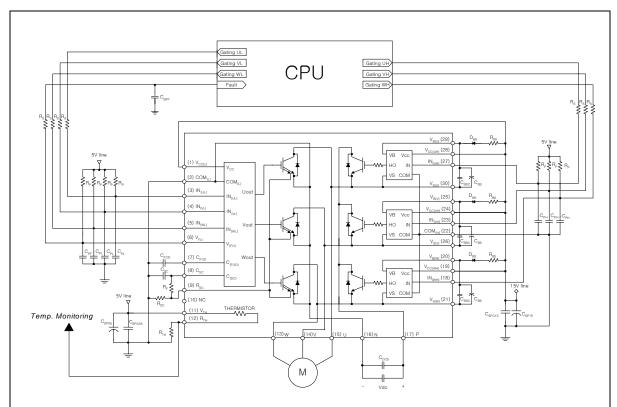

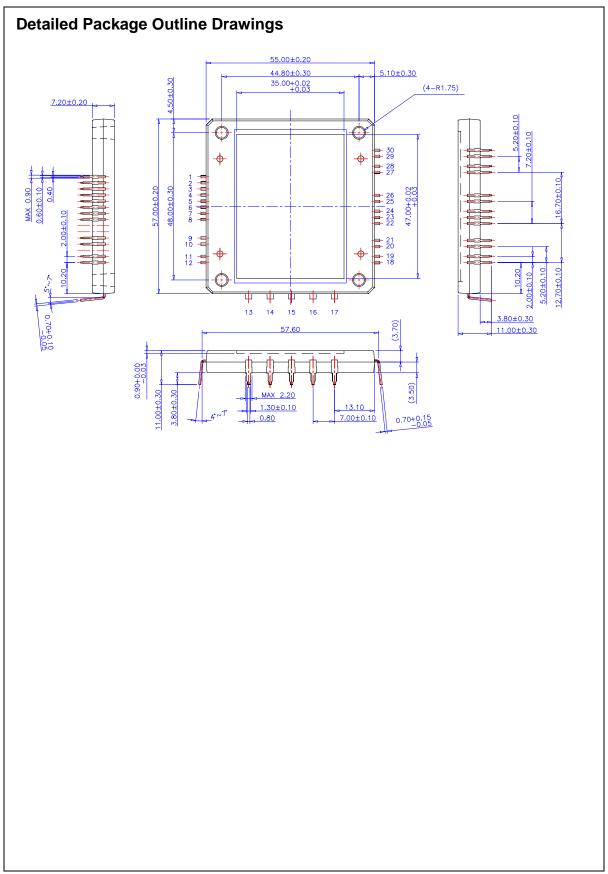

Fig. 16. Recommended Bootstrap Operation Circuit and Parameters

- 1. RpCpL/RpCpH coupling at each SPM input is recommended in order to prevent input signals' oscillation and it should be as close as possible to each SPM input
- 2. By virtue of integrating an application specific type HVIC inside the SPM, direct coupling to CPU terminals without any opto-coupler or transformer isolation is possible.
- V<sub>FO</sub> output is open collector type. This signal line should be pulled up to the positive side of the 5V power supply with approximately 4.7kΩ resistance. Please refer to Fig. 15.
- $C_{SP15}$  of around 7 times larger than bootstrap capacitor  $C_{BS}$  is recommended.  $V_{FO}$  output pulse width should be determined by connecting an external capacitor( $C_{FOD}$ ) between  $C_{FOD}$ (pin7) and  $COM_{(L)}$ (pin2). (Example : if  $C_{FOD}$  = 5.6 nF, then  $t_{FO}$  = 300  $\mu s$  (typ.)) Please refer to the note 5 for calculation method.
- 6. Each input signal line should be pulled up to the 5V power supply with approximately 4.7kΩ resistance (other RC coupling circuits at each input may be needed depending on the PWM control scheme used and on the wiring impedance of the system's printed circuit board). Approximately a 0.22-2nF by-pass capacitor should be used across each power supply connection terminals.
- To prevent errors of the protection function, the wiring around R<sub>SC</sub>, R<sub>F</sub> and C<sub>SC</sub> should be as short as possible.
   In the short-circuit protection circuit, please select the R<sub>F</sub>C<sub>SC</sub> time constant in the range 3~4 μs. R<sub>F</sub> should be at least 30 times larger than R<sub>SC</sub>. (Recommended Example:  $R_{SC} = 56 \Omega$ ,  $R_F = 3.9 k\Omega$  and  $C_{SC} = 1nF$ )

  9. Each capacitor should be mounted as close to the pins of the SPM as possible.
- 10. To prevent surge destruction, the wiring between the smoothing capacitor and the P&N pins should be as short as possible. The use of a high frequency non-inductive capacitor of around 0.1~0.22 uF between the P&N pins is recommended.
- 11.Relays are used at almost every systems of electrical equipments of home appliances. In these cases, there should be sufficient distance between the CPU and the relays. It is recommended that the distance be 5cm at least

### **DISCLAIMER**

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

### **LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

### PRODUCT STATUS DEFINITIONS

### **Definition of Terms**

| Datasheet Identification | Product Status            | Definition  |
|--------------------------|---------------------------|---|
| Advance Information      | Formative or In<br>Design | This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.  |
| Preliminary              | First Production          | This datasheet contains preliminary data, and supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design. |
| No Identification Needed | Full Production           | This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.   |
| Obsolete                 | Not In Production         | This datasheet contains specifications on a product that has been discontinued by Fairchild semiconductor. The datasheet is printed for reference information only.   |
