## 1.5–18 GHz Surface Mount Pseudomorphic HEMT

### Data Sheet

#### Description

The Avago ATF-36163 is a low-noise Pseudomorphic High Electron Mobility Transistor (PHEMT), in the SOT-363 (SC-70) package. When optimally matched for minimum noise figure, it will provide a noise figure of 1 dB at 12 GHz and 0.6 dB at 4 GHz.

Additionally, the ATF-36163 has low noise-resistance, which reduces the sensitivity of noise performance to variations in input impedance match. This feature makes the design of broad band low noise amplifiers much easier. The performance of the ATF-36163 makes this device the ideal choice for use in the 2nd or 3rd stage of low noise cascades. The repeatable performance and consistency make it appropriate for use in Ku-band Direct Broadcast Satellite (DBS) TV systems, C-band TV Receive Only (TVRO) LNAs, Multichannel Multipoint Distribution Systems (MMDS), X-band Radar detector and other low noise amplifiers operating in the 1.5–18 GHz frequency range.

This GaAs PHEMT device has a nominal 0.2 micron gate length with a total gate periphery (width) of 200 microns. Proven gold-based metallization system and nitride passivation assure rugged, reliable devices.

### Phase Reference Planes

The positions of the reference planes used to measure S-Parameters and to specify  $\Gamma_{opt}$  for the Noise Parameters are shown in Figure 10. As seen in the illustration, the reference planes are located at the extremities of the package leads.

Figure 10. Reference Planes.

### SOT-363 PCB Layout

A PCB pad layout for the miniature SOT-363 (SC-70) package used by the ATF-36163 is shown in Figure 11 (dimensions are in inches). This layout provides ample allowance for package placement by automated assembly equipment. The layout is shown with a nominal SOT-363 package footprint superimposed on the PCB pads.
