1. OUTLINE AND DEVICE CHARACTERISTICS

TMP91PW12 is OTP type MCU which includes 128 Kbyte One-time PROM. Using the adapter-socket, you can write and verify the data for TMP91PW12. TMP91PW12 has the same pin-assignment with TMP91CW12 (Mask ROM type).
Writing the program to Built-in PROM, TMP91PW12 operates as the same way with TMP91CW12.

3. OPERATION

This section describes in blocks the functions and basic operations of TMP91PW12.
The TMP91PW12 has PROM in place of the mask ROM which is included in the TMP91CW12. The other configuration and functions are the same as the TMP91CW12. Regarding the function of the TMP91PW12, which is not described herein, see the TMP91CW12.
The TMP91PW12 has two operational modes: MCU mode and PROM mode.

3.1 MCU mode

(1) Mode-setting and function

The MCU mode is set by driving High the AM1 and AM0 pin. In the MCU mode, the operation is same as TMP91CW12.

3.2 Memory Map

Input Voltage	V_{IN}	V	– 0.5 to Vcc + 0.5
Output Current	I_{OL}	mA	2
Output Current	I_{OH}	mA	– 2
Output Current (total)	ΣI_{OL}	mA	80
Output Current (total)	ΣI_{OH}	mA	– 80

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

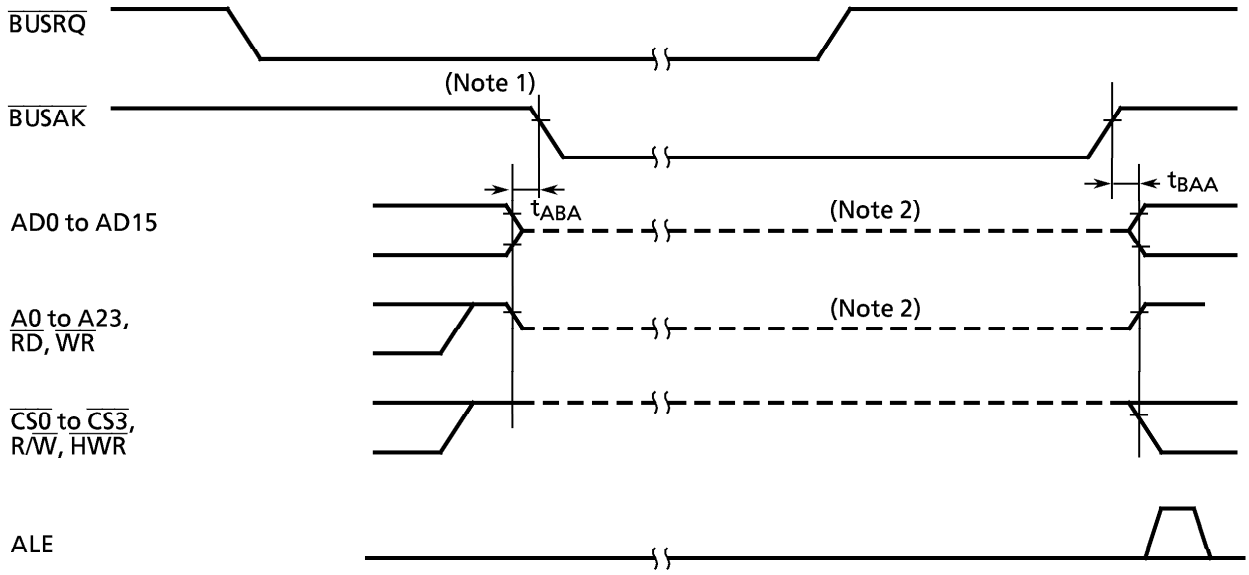
4.9 Bus Request / Bus Acknowledge



Symbol	Parameter	Variable		25 MHz		16 MHz		Unit
		Min	Max	Min	Max	Min	Max	
t_{ABA}	Output Buffer off to $\overline{BUSAK}$ Low	0	80	0	80	0	80	ns
t_{BAA}	$\overline{BUSAK}$ High to Output Buffer on	0	80	0	80	0	80	ns

Note1 : Even if the $\overline{BUSRQ}$ signal goes low, the bus will not be released while the $\overline{WAIT}$ signal is low. The bus will only be released when $\overline{BUSRQ}$ goes low while $\overline{WAIT}$ is high.

Note2 : This line shows only that the output buffer is in the off state.
It does not indicate that the signal level is fixed.
Just after the bus is released, the signal level set before the bus was released is maintained dynamically by the external capacitance. Therefor, to fix the signal level using an external resistor during bus release, careful design is necessary, as fixing of the level is delayed.
The internal programmable pull-up/pull-down resistor is switched between the active and non-active states by the internal signal.

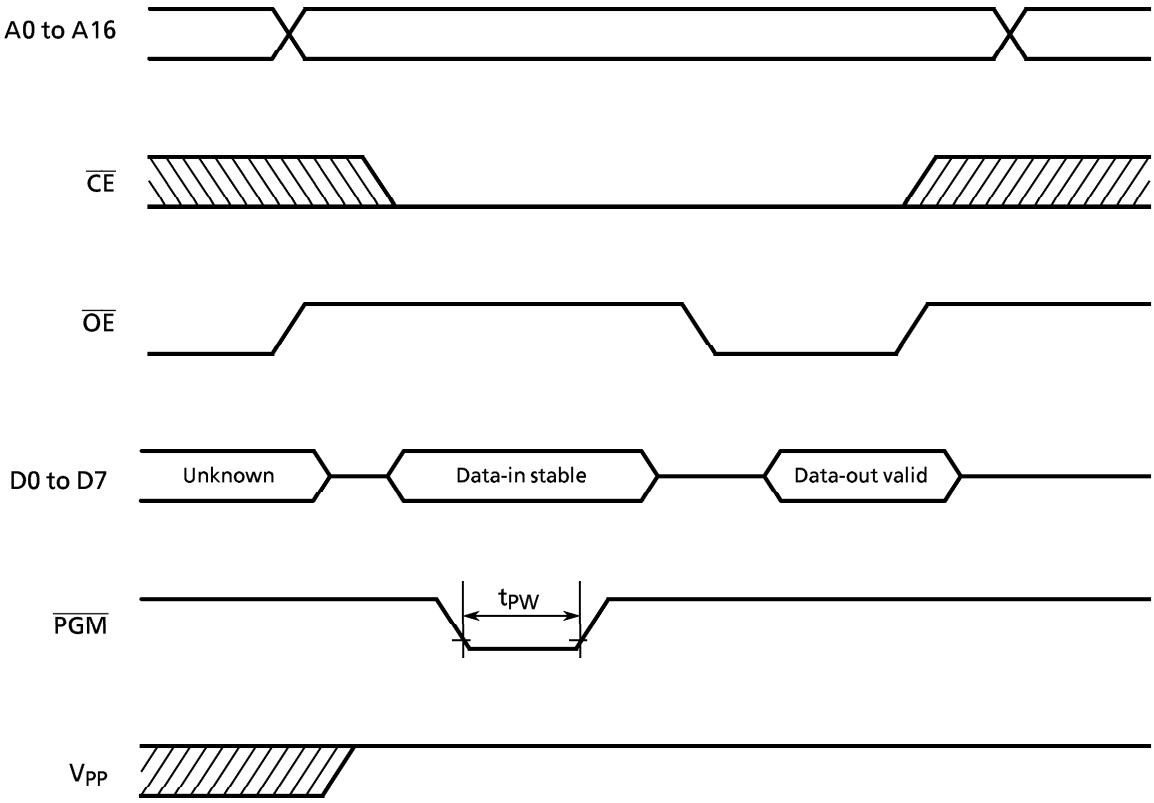
4.13 Timing chart of program operation in PROM mode



NOTE

1. The power supply of V_{PP} (12.75 V) must be turned on at the same time or the later time for a power supply of V_{CC} and must be turned off at the same time or early time for a power supply of V_{CC}.
2. The device suffers a damage taking out and putting in on the condition of $V_{PP} = 12.75$ V.
3. The maximum spec of V_{PP} pin is 14.0 V. Be carefull a overshoot at the programming.
