

MSC8101

Network Digital Signal Processor

The Freescale MSC8101 16-bit DSP is the first member of the family of DSPs based on the StarCore SC140 DSP core. The MSC8101 is available in three core speed levels: 250, 275, and 300 MHz.

What's New?
 Rev. 16 includes the following changes:
 • Changed most REFCLK references to DLLIN in Section 2.7.4.

Figure 1. MSC8101 Block Diagram

The Freescale MSC8101 DSP is a very versatile device that integrates the high-performance SC140 four-ALU (arithmetic logic unit) DSP core along with 512 KB of internal memory, a communications processor module (CPM), a 64-bit bus, a very flexible System Integration Unit (SIU), and a 16-channel DMA engine on a single device. With its four-ALU core, the MSC8101 can execute up to four multiply-accumulate (MAC) operations in a single clock cycle. The MSC8101 CPM is a 32-bit RISC-based communications protocol engine that can network to time-division multiplexed (TDM) highways, Ethernet, and asynchronous transfer mode (ATM) backbones. The MSC8101 60x-compatible bus interface facilitates its connection to multi-master system architectures. The very large internal memory, 512 KB, reduces the need for external program and data memories. The MSC8101 offers 1500 DSP MMACS (1200 core and 300 EFCOP) performance using an internal 300 MHz clock with a 1.6 V core and independent 3.3 V input/output (I/O).

Data Sheet Conventions

pin and pin-out	Although the device package does not have pins, the term pins and pin-out are used for convenience and indicate specific signal locations within the ball-grid array.			
<u>OVERBAR</u>	Used to indicate a signal that is active when pulled low (For example, the $\overline{\text{RESET}}$ pin is active when low.)			
“asserted”	Means that a high true (active high) signal is high or that a low true (active low) signal is low			
“deasserted”	Means that a high true (active high) signal is low or that a low true (active low) signal is high			
Examples:	Signal/Symbol	Logic State	Signal State	Voltage
	$\overline{\text{PIN}}$	True	Asserted	$V_{\text{IL}}/V_{\text{OL}}$
	$\overline{\text{PIN}}$	False	Deasserted	$V_{\text{IH}}/V_{\text{OH}}$
	PIN	True	Asserted	$V_{\text{IH}}/V_{\text{OH}}$
	PIN	False	Deasserted	$V_{\text{IL}}/V_{\text{OL}}$

Note: Values for V_{IL} , V_{OL} , V_{IH} , and V_{OH} are defined by individual product specifications.

MSC8101 Features

- SC140 core
 - Architecture optimized for efficient C/C++ code compilation
 - Four 16-bit ALUs and two 32-bit AGUs
 - 1200 DSP MMACS running at 300 MHz
 - Very low power dissipation
 - Variable-length execution set (VLES) execution model
 - JTAG/Enhanced OnCE debug port
- Communications processor module (CPM)
 - Programmable protocol machine using a 32-bit RISC engine
 - 155 Mbps ATM interface (including AAL 0/1/2/5)
 - 10/100 Mbit Ethernet interface
 - Up to four E1/T1 interfaces or one E3/T3 interface and one E1/T1 interface
 - HDLC support up to T3 rates, or 256 channels
- 64- or 32-bit wide bus interface
 - Support for bursts for high efficiency
 - Glueless interface to 60x-compatible bus systems
 - Multi-master support
- Enhanced filter coprocessor (EFCOP)
 - Independently and concurrently executes long filters (such as echo cancellation)
 - Runs at 250/275/300 MHz and provides 250/275/300 MMACS performance
- Programmable memory controller
 - Control for up to eight banks of external memory
 - User-programmable machines (UPM) allowing glueless interface to various memory types (SRAM, DRAM, EPROM, and Flash memory) and other user-definable peripherals
 - Dedicated pipelined SDRAM memory interface
- Large internal SRAM
 - 256K 16-bit words (512 KB)
 - Unified program and data space configurable by the application
 - Word and byte addressable
- DMA controller
 - 16 DMA channels, FIFO based, with burst capabilities
 - Sophisticated addressing capabilities
- Small foot print package
 - 17 mm × 17 mm lidded FC-PBGA package
- Very low power consumption
 - Separate power supply for internal logic (1.6 V) and for I/O (3.3 V)
- Enhanced 16-bit parallel host interface (HDI16)
 - Supports a variety of microcontroller, microprocessor, and DSP bus interfaces
- Phase-lock loops (PLLs)
 - System PLL
 - CPM DPLLs (SCC and SCM)
- Process technology
 - 0.13 micron copper interconnect process technology

Target Applications

The MSC8101 targets applications requiring very high performance, very large amounts of internal memory, and such networking capabilities as:

- Third-generation wideband wireless infrastructure systems
- Packet Telephony systems
- Multi-channel modem banks
- Multi-channel xDSL

Product Documentation

The documents listed in **Table 1** are required for a complete description of the MSC8101 and are necessary to design properly with the part. Documentation is available from the following sources (see back cover for details):

- A local Freescale distributor
- A Freescale Semiconductor sales office
- A Freescale Semiconductor Literature Distribution Center
- The world wide web (WWW)

Table 1. MSC8101 Documentation

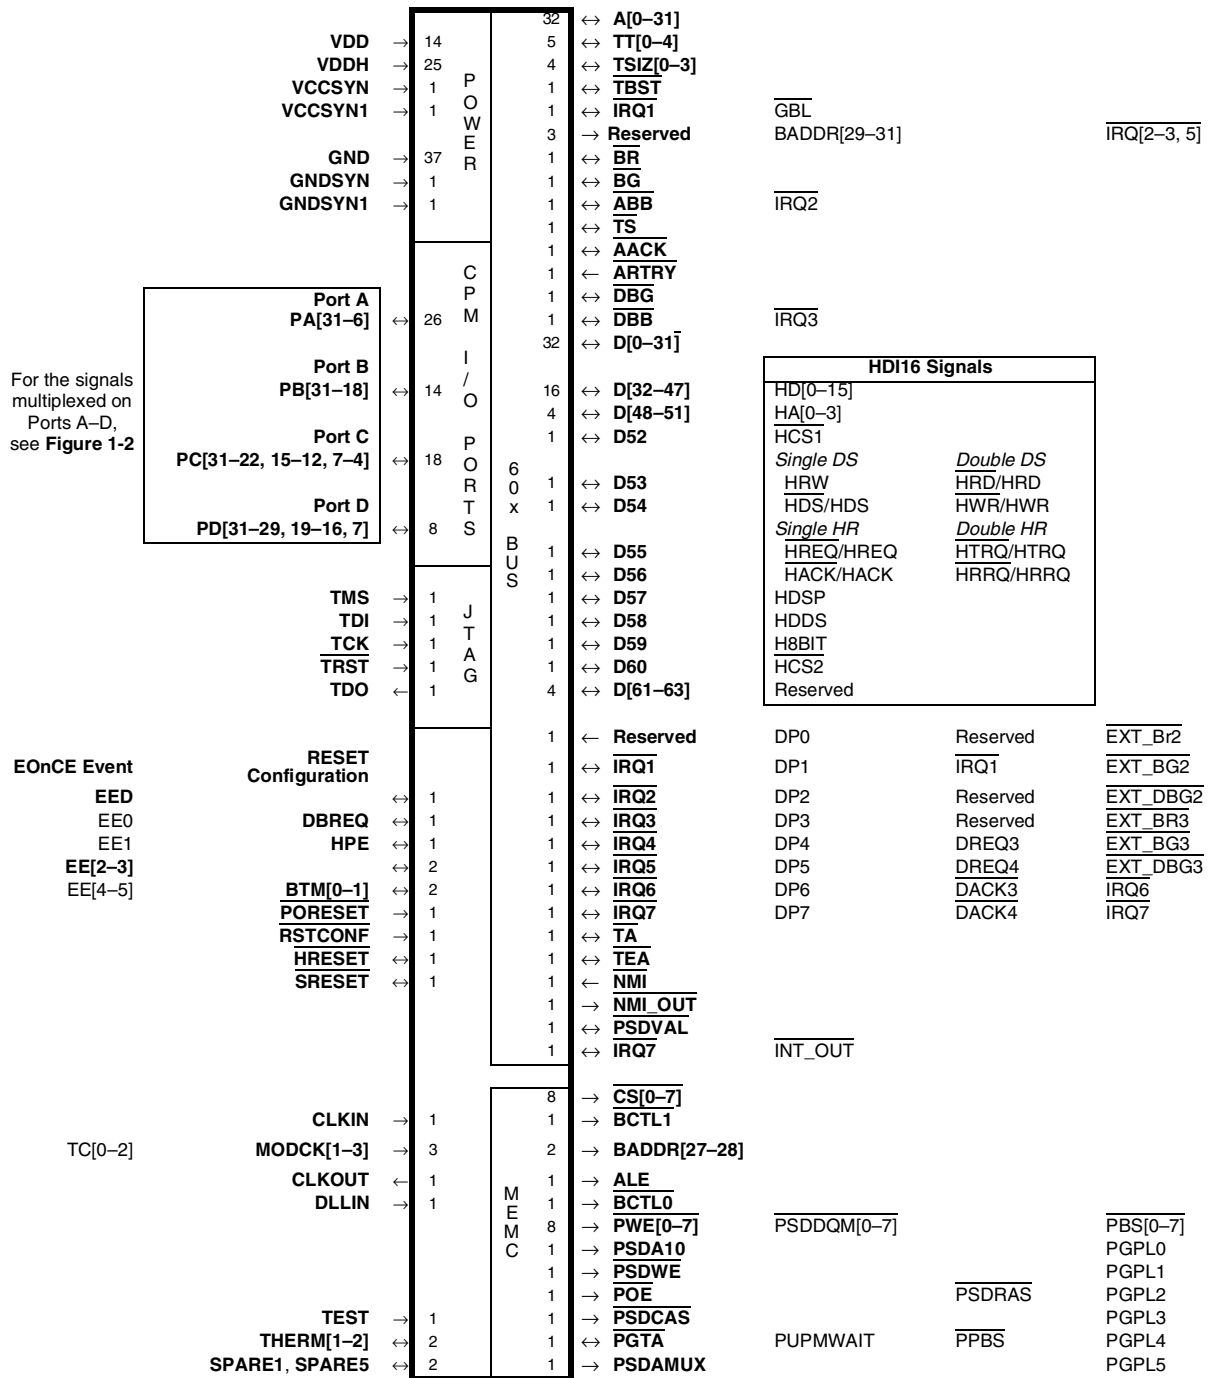

Name	Description	Order Number
<i>MSC8101 Technical Data</i>	MSC8101 features list and physical, electrical, timing, and package specifications	MSC8101/D
<i>MSC8101 User's Guide</i>	Detailed functional description of the MSC8101 memory configuration, operation, and register programming	MSC8101UG/D
<i>MSC8101 Pocket Guide</i>	Quick reference information for application development.	MSC8101PG/D
<i>MSC8101 Reference Manual</i>	Detailed description of the MSC8101 processor core and instruction set	MSC8101RM/D
<i>SC140 DSP Core Reference Manual</i>	Detailed description of the SC140 family processor core and instruction set	MNSC140CORE/D
<i>Application Notes</i>	Documents describing specific applications or optimized device operation including code examples	See the MSC8101 product website

Signals/Connections

The MSC8101 external signals are organized into functional groups, as shown in **Table 1-1**, **Figure 1-1**, and **Figure 1-2**. **Table 1-1** lists the functional groups, states the number of signal connections in each group, and references the table that gives details on multiplexed signals within each group. **Figure 1-1** shows MSC8101 external signals organized by function. **Figure 1-2** indicates how the parallel input/output (I/O) ports signals are multiplexed. Because the parallel I/O design supported by the MSC8101 communications processor module (CPM) is a subset of the parallel I/O signals supported by the MPC8260 device, port pins are not numbered sequentially.

Table 1-1. MSC8101 Functional Signal Groupings

Functional Group		Number of Signal Connections	Detailed Description
Power (V_{CC} , V_{DD} , and GND)		80	Table 1-2 on page 1-4
Clock		6	Table 1-3 on page 1-4
Reset, configuration, and EOnCE		11	Table 1-4 on page 1-5
System bus, HDI16, and interrupts		133	Table 1-5 on page 1-7
Memory Controller		27	Table 1-6 on page 1-13
CPM Input/Output Parallel Ports	Port A	26	Table 1-7 on page 1-16
	Port B	14	Table 1-8 on page 1-21
	Port C	18	Table 1-9 on page 1-24
	Port D	8	Table 1-10 on page 1-33
JTAG Test Access Port		5	Table 1-11 on page 1-36
Reserved (denotes connections that are always reserved)		5	Table 1-12 on page 1-36

Note: Refer to the System Interface Unit (SIU) chapter in the MSC8101 Reference Manual for details on how to configure these pins.

Figure 1-1. MSC8101 External Signals

1.1 Power Signals

Table 1-2. Power and Ground Signal Inputs

Power Name	Description
V _{DD}	Internal Logic Power V _{DD} dedicated for use with the device core. The voltage should be well-regulated and the input should be provided with an extremely low impedance path to the V _{DD} power rail.
V _{DDH}	Input/Output Power This source supplies power for the I/O buffers. The user must provide adequate external decoupling capacitors.
V _{CCSYN}	System PLL Power V _{CC} dedicated for use with the system Phase Lock Loop (PLL). The voltage should be well-regulated and the input should be provided with an extremely low impedance path to the V _{CC} power rail.
V _{CCSYN1}	SC140 PLL Power V _{CC} dedicated for use with the SC140 core PLL. The voltage should be well-regulated and the input should be provided with an extremely low impedance path to the V _{CC} power rail.
GND	System Ground An isolated ground for the internal processing logic. This connection must be tied externally to all chip ground connections, except GND _{SYN} and GND _{SYN1} . The user must provide adequate external decoupling capacitors.
GND _{SYN}	System PLL Ground Ground dedicated for system PLL use. The connection should be provided with an extremely low-impedance path to ground.
GND _{SYN1}	SC140 PLL Ground 1 Ground dedicated for SC140 core PLL use. The connection should be provided with an extremely low-impedance path to ground.

1.2 Clock Signals

Table 1-3. Clock Signals

Signal Name	Type	Signal Description
CLKIN	Input	Clock In Primary clock input to the MSC8101 PLL.
MODCK1	Input	Clock Mode Input 1 Defines the operating mode of internal clock circuits.
TC0	Output	Transfer Code 0 Supplies information that can be useful for debugging bus transactions initiated by the MSC8101.
BNKSEL0	Output	Bank Select 0 Selects the SDRAM bank when the MSC8101 is in 60x-compatible bus mode.
MODCK2	Input	Clock Mode Input 2 Defines the operating mode of internal clock circuits.
TC1	Output	Transfer Code 1 Supplies information that can be useful for debugging bus transactions initiated by the MSC8101.
BNKSEL1	Output	Bank Select 1 Selects the SDRAM bank when the MSC8101 is in 60x-compatible bus mode.
MODCK3	Input	Clock Mode Input 3 Defines the operating mode of internal clock circuits.
TC2	Output	Transfer Code 2 Supplies information that can be useful for debugging bus transactions initiated by the MSC8101.
BNKSEL2	Output	Bank Select 2 Selects the SDRAM bank when the MSC8101 is in 60x-compatible bus mode.

Table 1-3. Clock Signals (Continued)

Signal Name	Type	Signal Description
CLKOUT	Output	Clock Out The system bus clock.
DLLIN	Input	DLLIN Synchronizes with an external device. Note: When the DLL is disabled, connect this signal to GND.

1.3 Reset, Configuration, and EOnCE Event Signals

Table 1-4. Reset, Configuration, and EOnCE Event Signals

Signal Name	Type	Signal Description
DBREQ	Input	Debug Request Determines whether to go into SC140 Debug mode when $\overline{\text{PORESET}}$ is deasserted.
EE0 ¹		Enhanced OnCE (EOnCE) Event 0 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE0 as an input (default) or an output.
	Input	Debug request, enable Address Event Detection Channel 0, or generate an EOnCE event.
	Output	Detection by Address Event Detection Channel 0. Used to trigger external debugging equipment.
HPE	Input	Host Port Enable When this pin is asserted during $\overline{\text{PORESET}}$, the Host port is enabled, the system data bus is 32 bits wide, and the Host <i>must</i> program the reset configuration word.
EE1 ¹		EOnCE Event 1 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE1 as an input (default) or an output.
	Input	Enable Address Event Detection Channel 1 or generate an EOnCE event.
	Output	Debug Acknowledge or detection by Address Event Detection Channel 1. Used to trigger external debugging equipment.
EE2 ¹		EOnCE Event 2 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE2 as an input (default) or an output.
	Input	Enable Address Event Detection Channel 2 or generate an EOnCE event or enable the Event Counter.
	Output	Detection by Address Event Detection Channel 2. Used to trigger external debugging equipment.
EE3 ¹		EOnCE Event 3 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE3 as an input (default) or an output. See the emulation and debug chapter in the <i>SC140 DSP Core Reference Manual</i> for details on the ERCV Register.
	Input	Enable Address Event Detection Channel 3 or generate one of the EOnCE events.
	Output	The DSP has read the EOnCE Receive Register (ERCV). Triggers external debugging equipment.

Table 1-4. Reset, Configuration, and EOnCE Event Signals (Continued)

Signal Name	Type	Signal Description
BTM[0-1]	Input	Boot Mode 0-1 Determines the MSC8101 boot mode when $\overline{\text{PORESET}}$ is deasserted. See the emulation and debug chapter in the <i>SC140 DSP Core Reference Manual</i> for details on how to set these pins.
EE4 ¹	Input	EOnCE Event 4 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE4 as an input (default) or an output. See the emulation and debug chapter in the <i>SC140 DSP Core Reference Manual</i> for details on the ETRSMT Register. Enable Address Event Detection Channel 4 or generate an EOnCE event.
EE5 ¹	Output	The DSP wrote the EOnCE Transmit Register (ETRSMT). Triggers external debugging equipment.
	Input	EOnCE Event 5 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE5 as an input (default) or an output. Enable Address Event Detection Channel 5.
	Output	Detection by Address Event Detection Channel 5. Triggers external debugging equipment.
EED ¹	Input	Enhanced OnCE (EOnCE) Event Detection After $\overline{\text{PORESET}}$ is deasserted, you can configure EED as an input (default) or output: Enable the Data Event Detection Channel.
	Output	Detection by the Data Event Detection Channel. Triggers external debugging equipment.
$\overline{\text{PORESET}}$	Input	Power-On Reset When asserted, this line causes the MSC8101 to enter power-on reset state.
$\overline{\text{RSTCONF}}$	Input	Reset Configuration Used during reset configuration sequence of the chip. A detailed explanation of its function is provided in the “Power-On Reset Flow” and “Hardware Reset Configuration” sections of the <i>MSC8101 Reference Manual</i> .
$\overline{\text{HRESET}}$	Input	Hard Reset When asserted, this open-drain line causes the MSC8101 to enter the hard reset state.
$\overline{\text{SRESET}}$	Input	Soft Reset When asserted, this open-drain line causes the MSC8101 to enter the soft reset state.
Note: See the emulation and debug chapter in the <i>SC140 DSP Core Reference Manual</i> for details on how to configure these pins.		

1.4 System Bus, HDI16, and Interrupt Signals

The system bus, HDI16, and interrupt signals are grouped together because they use a common set of signal lines. Individual assignment of a signal to a specific signal line is configured through registers in the System Interface Unit (SIU) and the Host Interface (HDI16). 1-5 describes the signals in this group.

Note: To boot from the host interface, the HDI16 must be enabled by pulling up the HPE signal line during $\overline{\text{PORESET}}$. The configuration word must then be loaded from the host. The configuration word must set the Internal Space Port Size bit in the Bus Control Register (BCR[ISPS]) to change the system data bus width from 64 bits to 32 bits and reassign the upper 32 bits to their HDI16 functions. Never set the Host Port Enable (HEN) bit in the Host Port Control Register (HPCR) to enable the HDI16, unless the bus size is first changed from 64 bits to 32 bits. Otherwise, unpredictable operation may occur.

Although there are eight interrupt request ($\overline{\text{IRQ}}$) connections to the core processor, there are multiple external lines that can connect to these internal signal lines. After reset, the default configuration includes two $\overline{\text{IRQ1}}$ and two $\overline{\text{IRQ7}}$ input lines. The designer must select one line for each required interrupt and reconfigure the other external signal line or lines for alternate functions.

Table 1-5. System Bus, HDI16, and Interrupt Signals

Signal	Data Flow	Description
A[0–31]	Input/Output	Address Bus When the MSC8101 is in external master bus mode, these pins function as the address bus. The MSC8101 drives the address of its internal bus masters and responds to addresses generated by external bus masters. When the MSC8101 is in Internal Master Bus mode, these pins are used as address lines connected to memory devices and are controlled by the MSC8101 memory controller.
TT[0–4]	Input/Output	Bus Transfer Type The bus master drives these pins during the address tenure to specify the type of transaction.
TSIZ[0–3]	Input/Output	Transfer Size The bus master drives these pins with a value indicating the number of bytes transferred in the current transaction.
$\overline{\text{TBS}}$	Input/Output	Bus Transfer Burst The bus master asserts this pin to indicate that the current transaction is a burst transaction (transfers four quad words).
$\overline{\text{IRQ1}}$	Input	Interrupt Request 1¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
$\overline{\text{GBL}}$	Input/Output	Global¹ When a master within the chip initiates a bus transaction, it drives this pin. When an external master initiates a bus transaction, it should drive this pin. Assertion of this pin indicates that the transfer is global and it should be snooped by caches in the system.
Reserved	Output	The primary configuration is reserved.
BADDR29	Output	Burst Address 29¹ One of five outputs of the memory controller. These pins connect directly to memory devices controlled by the MSC8101 memory controller.
$\overline{\text{IRQ2}}$	Input	Interrupt Request 2¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
Reserved	Output	The primary configuration is reserved.
BADDR30	Output	Burst Address 30¹ One of five outputs of the memory controller. These pins connect directly to memory devices controlled by the MSC8101 memory controller.
$\overline{\text{IRQ3}}$	Input	Interrupt Request 3¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
Reserved	Output	The primary configuration is reserved.
BADDR31	Output	Burst Address 31¹ One of five outputs of the memory controller. These pins connect directly to memory devices controlled by the MSC8101 memory controller.
$\overline{\text{IRQ5}}$	Input	Interrupt Request 5¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
$\overline{\text{BR}}$	Input/Output Output Input	Bus Request² An output when an external arbiter is used. The MSC8101 asserts this pin to request ownership of the bus. An input when an internal arbiter is used. An external master should assert this pin to request bus ownership from the internal arbiter.
$\overline{\text{BG}}$	Input/Output Output Input	Bus Grant² An output when an internal arbiter is used. The MSC8101 asserts this pin to grant bus ownership to an external bus master. An input when an external arbiter is used. The external arbiter should assert this pin to grant bus ownership to the MSC8101.
$\overline{\text{ABB}}$	Input/Output Output Input	Address Bus Busy¹ The MSC8101 asserts this pin for the duration of the address bus tenure. Following an address acknowledge (AACK) signal, which terminates the address bus tenure, the MSC8101 deasserts ABB for a fraction of a bus cycle and then stops driving this pin. The MSC8101 does not assume bus ownership while it this pin is asserted by an external bus master.
$\overline{\text{IRQ2}}$	Input	Interrupt Request 2¹ One of the eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
$\overline{\text{TS}}$	Input/Output	Bus Transfer Start Signals the beginning of a new address bus tenure. The MSC8101 asserts this signal when one of its internal bus masters (SC140 core or DMA controller) begins an address tenure. When the MSC8101 senses this pin being asserted by an external bus master, it responds to the address bus tenure as required (snoop if enabled, access internal MSC8101 resources, memory controller support).
$\overline{\text{AACK}}$	Input/Output	Address Acknowledge A bus slave asserts this signal to indicate that it identified the address tenure. Assertion of this signal terminates the address tenure.
$\overline{\text{ARTRY}}$	Input	Address Retry Assertion of this signal indicates that the bus transaction should be retried by the bus master. The MSC8101 asserts this signal to enforce data coherency with its internal cache and to prevent deadlock situations.
$\overline{\text{DBG}}$	Input/Output Output Input	Data Bus Grant² An output when an internal arbiter is used. The MSC8101 asserts this pin as an output to grant data bus ownership to an external bus master. An input when an external arbiter is used. The external arbiter should assert this pin as an input to grant data bus ownership to the MSC8101.
$\overline{\text{DBB}}$	Input/Output Output Input	Data Bus Busy¹ The MSC8101 asserts this pin as an output for the duration of the data bus tenure. Following a $\overline{\text{TA}}$, which terminates the data bus tenure, the MSC8101 deasserts DBB for a fraction of a bus cycle and then stops driving this pin. The MSC8101 does not assume data bus ownership while $\overline{\text{DBB}}$ is asserted by an external bus master.
$\overline{\text{IRQ3}}$	Input	Interrupt Request 3¹ One of the eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
D[0–31]	Input/Output	Data Bus Most Significant Word In write transactions the bus master drives the valid data on this bus. In read transactions the slave drives the valid data on this bus. In Host Port Disabled mode, these 32 bits are part of the 64-bit data bus. In Host Port Enabled mode, these bits are used as the bus in 32-bit mode.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
D[32–47]	Input/Output	Data Bus Bits 32–47 In write transactions the bus master drives the valid data on this bus. In read transactions the slave drives the valid data on this bus.
HD[0–15]	Input/Output	Host Data² When the HDI16 interface is enabled, these signals are lines 0-15 of the bidirectional tri-state data bus.
D[48–51]	Input/Output	Data Bus Bits 48–51 In write transactions the bus master drives the valid data on these pins. In read transactions the slave drives the valid data on these pins.
HA[0–3]	Input	Host Address Line 0–3³ When the HDI16 interface bus is enabled, these lines address internal host registers.
D52	Input/Output	Data Bus Bit 52 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HCS1}}$	Input	Host Chip Select³ When the HDI16 interface is enabled, this is one of the two chip-select pins. The HDI16 chip select is a logical OR of $\overline{\text{HCS1}}$ and $\overline{\text{HCS2}}$.
D53	Input/Output	Data Bus Bit 53 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
HRW	Input	Host Read Write Select³ When the HDI16 interface is enabled in Single Strobe mode, this is the read/write input (HRW).
$\overline{\text{HRD}}/\text{HRD}$	Input	Host Read Strobe³ When the HDI16 is programmed to interface with a double data strobe host bus, this pin is the read data strobe Schmitt trigger input ($\overline{\text{HRD}}/\text{HRD}$). The polarity of the data strobe is programmable.
D54	Input/Output	Data Bus Bit 54 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HDS}}/\text{HDS}$	Input	Host Data Strobe³ When the HDI16 is programmed to interface with a single data strobe host bus, this pin is the data strobe Schmitt trigger input ($\overline{\text{HDS}}/\text{HDS}$). The polarity of the data strobe is programmable.
$\overline{\text{HWR}}/\text{HWR}$	Input	Host Write Data Strobe³ When the HDI16 is programmed to interface with a double data strobe host bus, this pin is the write data strobe Schmitt trigger input ($\overline{\text{HWR}}/\text{HWR}$). The polarity of the data strobe is programmable.
D55	Input/Output	Data Bus Bit 55 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HREQ}}/\text{HREQ}$	Output	Host Request³ When the HDI16 is programmed to interface with a single host request host bus, this pin is the host request output ($\overline{\text{HREQ}}/\text{HREQ}$). The polarity of the host request is programmable. The host request may be programmed as a driven or open-drain output.
$\overline{\text{HTRQ}}/\text{HTRQ}$	Output	Transmit Host Request³ When the HDI16 is programmed to interface with a double host request host bus, this pin is the transmit host request output ($\overline{\text{HTRQ}}/\text{HTRQ}$). The signal can be programmed as driven or open drain. The polarity of the host request is programmable.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
D56	Input/Output	Data Bus Bit 56 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HACK}}/\text{HACK}$	Output	Host Acknowledge³ When the HDI16 is programmed to interface with a single host request host bus, this pin is the host acknowledge Schmitt trigger input (HACK). The polarity of the host acknowledge is programmable.
$\overline{\text{HRRQ}}/\text{HRRQ}$	Output	Receive Host Request³ When the HDI16 is programmed to interface with a double host request host bus, this pin is the receive host request output ($\overline{\text{HRRQ}}/\text{HRRQ}$). The signal can be programmed as driven or open drain. The polarity of the host request is programmable.
D57	Input/Output	Data Bus Bit 57 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
HDSP	Input	Host Data Strobe Polarity³ When the HDI16 interface is enabled, this pin is the host data strobe polarity (HDSP).
D58	Input/Output	Data Bus Bit 58 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
HDDS	Input	Host Dual Data Strobe³ When the HDI16 interface is enabled, this pin is the host dual data strobe (HDDS).
D59	Input/Output	Data Bus Bit 59 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
H8BIT	Input	H8BIT³ When the HDI16 interface is enabled, this bit determines if the interface is in 8-bit or 16-bit mode.
D60	Input/Output	Data Bus Bit 60 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HCS2}}$	Input	Host Chip Select³ When the HDI16 interface is enabled, this is one of the two chip-select pins. The HDI16 chip select is a logical OR of HCS1 and HCS2.
D[61–63]	Input/Output	Data Bus Bits 61–63 Used only in 60x-mode-only mode. In write transactions the bus master drives the valid data on this bus. In read transactions the slave drives the valid data on this bus.
Reserved		These dedicated signals are reserved when the HDI16 is enabled. ³
Reserved	Input	The primary configuration is reserved.
DP0	Input/Output	Data Parity 0¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity zero pin should give odd parity (odd number of ones) on the group of signals that includes data parity 0 and D[0–7].
$\overline{\text{EXT_BR2}}$	Input	External Bus Request 2^{1,2} An external master asserts this pin to request bus ownership from the internal arbiter.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
$\overline{\text{IRQ1}}$	Input	Interrupt Request 1¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP1	Input/Output	Data Parity 1¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity one pin should give odd parity (odd number of ones) on the group of signals that includes data parity 1 and D[8–15].
$\overline{\text{EXT_BG2}}$	Output	External Bus Grant 2^{1,2} The MSC8101 asserts this pin to grant bus ownership to an external bus master.
$\overline{\text{IRQ2}}$	Input	Interrupt Request 2¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP2	Input/Output	Data Parity 2¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity two pin should give odd parity (odd number of ones) on the group of signals that includes data parity 2 and D[16–23].
$\overline{\text{EXT_DBG2}}$	Output	External Data Bus Grant 2^{1,2} The MSC8101 asserts this pin to grant data bus ownership to an external bus master.
$\overline{\text{IRQ3}}$	Input	Interrupt Request 3¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP3	Input/Output	Data Parity 3¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity three pin should give odd parity (odd number of ones) on the group of signals that includes data parity 3 and D[24–31].
$\overline{\text{EXT_BR3}}$	Input	External Bus Request 3^{1,2} An external master asserts this pin to request bus ownership from the internal arbiter.
$\overline{\text{IRQ4}}$	Input	Interrupt Request 4¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP4	Input/Output	Data Parity 4¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity four pin should give odd parity (odd number of ones) on the group of signals that includes data parity 4 and D[32–39].
DREQ3	Input	DMA Request 3¹ An external peripheral uses this pin to request DMA service.
$\overline{\text{EXT_BG3}}$	Output	External Bus Grant 3^{1,2} The MSC8101 asserts this pin to grant bus ownership to an external bus master.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
$\overline{\text{IRQ5}}$	Input	Interrupt Request 5¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP5	Input/Output	Data Parity 5¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity five pin should give odd parity (odd number of ones) on the group of signals that includes data parity 5 and D[40–47].
DREQ4	Input	DMA Request 4¹ An external peripheral uses this pin to request DMA service.
$\overline{\text{EXT_DBG3}}$	Output	External Data Bus Grant 3^{1,2} The MSC8101 asserts this pin to grant data bus ownership to an external bus master.
$\overline{\text{IRQ6}}$	Input	Interrupt Request 6¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP6	Input/Output	Data Parity 6¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity six pin should give odd parity (odd number of ones) on the group of signals that includes data parity 6 and D[48–55].
$\overline{\text{DACK3}}$	Output	DMA Acknowledge 3¹ The DMA controller drives this output to acknowledge the DMA transaction on the bus.
$\overline{\text{IRQ7}}$	Input	Interrupt Request 7¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP7	Input/Output	Data Parity 7¹ The master or slave that drives the data bus also drives the data parity signals. The value driven on the data parity seven pin should give odd parity (odd number of ones) on the group of signals that includes data parity 7 and D[56–63].
$\overline{\text{DACK4}}$	Output	DMA Acknowledge¹ The DMA controller drives this output to acknowledge the DMA transaction on the bus.
$\overline{\text{TA}}$	Input/Output	Transfer Acknowledge Indicates that a data beat is valid on the data bus. For single beat transfers, assertion of $\overline{\text{TA}}$ indicates the termination of the transfer. For burst transfers, $\overline{\text{TA}}$ is asserted four times to indicate the transfer of four data beats with the last assertion indicating the termination of the burst transfer.
$\overline{\text{TEA}}$	Input/Output	Transfer Error Acknowledge Indicates a bus error. masters within the MSC8101 monitor the state of this pin. The MSC8101 internal bus monitor can assert this pin if it identifies a bus transfer that is hung.
$\overline{\text{NMI}}$	Input	Non-Maskable Interrupt When an external device asserts this line, the MSC8101 $\overline{\text{NMI}}$ input is asserted.
$\overline{\text{NMI_OUT}}$	Output	Non-Maskable Interrupt Driven from the MSC8101 internal interrupt controller. Assertion of this output indicates that a non-maskable interrupt, pending in the MSC8101 internal interrupt controller, is waiting to be handled by an external host.
$\overline{\text{PSDVAL}}$	Input/Output	Data Valid Indicates that a data beat is valid on the data bus. The difference between the $\overline{\text{TA}}$ pin and $\overline{\text{PSDVAL}}$ is that the $\overline{\text{TA}}$ pin is asserted to indicate data transfer terminations while the $\overline{\text{PSDVAL}}$ signal is asserted with each data beat movement. Thus, when $\overline{\text{TA}}$ is asserted, $\overline{\text{PSDVAL}}$ is asserted, but when $\overline{\text{PSDVAL}}$ is asserted, $\overline{\text{TA}}$ is not necessarily asserted. For example when the SDMA initiates a double word (2x64 bits) transfer to a memory device that has a 32-bit port size, $\overline{\text{PSDVAL}}$ is asserted three times without $\overline{\text{TA}}$, and finally both pins are asserted to terminate the transfer.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
$\overline{\text{IRQ7}}$	Input	Interrupt Request 7¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
$\overline{\text{INT_OUT}}$	Output	Interrupt Output¹ Driven from the MSC8101 internal interrupt controller. Assertion of this output indicates that an unmasked interrupt is pending in the MSC8101 internal interrupt controller.
<p>Notes:</p> <ol style="list-style-type: none"> 1. See the SIU chapter in the <i>MSC8101 Reference Manual</i> for details on how to configure these pins. 2. When used as the bus control arbiter for the system bus, the MSC8101 can support up to three external bus masters. Each master uses its own set of Bus Request, Bus Grant, and Data Bus Grant signals ($\overline{\text{BR/BG/DBG}}$, $\overline{\text{EXT_BR2/EXT_BG2/EXT_DBG2}}$, and $\overline{\text{EXT_BR3/EXT_BG3/EXT_DBG3}}$). Each of these signal sets must be configured to indicate whether the external master is or is not a MSC8101 master device. See the Bus Configuration Register (BCR) description in the SIU chapter in the <i>MSC8101 Reference Manual</i> for details on how to configure these pins. The second and third set of pins is defined by EXT_xxx to indicate that they can only be used with external master devices. The first set of pins ($\overline{\text{BR/BG/DBG}}$) have a dual function. When the MSC8101 is not the bus arbiter, these signals ($\overline{\text{BR/BG/DBG}}$) are used by the MSC8101 to obtain master control of the bus. 3. See the host interface (HDI16) chapter in the <i>MSC8101 Reference Manual</i> for details on how to configure these pins. 		

1.5 Memory Controller Signals

Refer to the memory controller chapter in the *MSC8101 Reference Manual (MSC8101RM/D)* for detailed information about configuring these signals.

Table 1-6. Memory Controller Signals

Signal	Data Flow	Description
$\overline{\text{CS}}[0-7]$	Output	Chip Select Enable specific memory devices or peripherals connected to MSC8101 buses.
$\overline{\text{BCTL1}}$	Output	Buffer Control 1 Controls buffers on the data bus. Usually used with $\overline{\text{BCTL0}}$. The exact function of this pin is defined by the value of SIUMCR[BCTL1C]. See the <i>System Interface Unit (SIU)</i> chapter in the <i>MSC8101 Reference Manual</i> for details.
$\overline{\text{BADDR}}[27-28]$	Output	Burst Address 27-28 Two of five outputs of the memory controller. These pins connect directly to memory devices controlled by the MSC8101 memory controller.
ALE	Output	Address Latch Enable Controls the external address latch used in external master bus configuration.
$\overline{\text{BCTL0}}$	Output	Buffer Control 0 Controls buffers on the data bus. The exact function of this pin is defined by the value of SIUMCR[BCTL0C]. See the <i>System Interface Unit (SIU)</i> chapter in the <i>MSC8101 Reference Manual</i> for details.
$\overline{\text{PWE}}[0-7]$	Output	Bus Write Enable Outputs of the bus General-Purpose Chip-select Machine (GPCM). These pins select byte lanes for write operations.
$\overline{\text{PSDDQM}}[0-7]$	Output	
$\overline{\text{PBS}}[0-7]$	Output	

Table 1-6. Memory Controller Signals (Continued)

Signal	Data Flow	Description
PSDA10	Output	Bus SDRAM A10 Output from the bus SDRAM controller. This pin is part of the address when a row address is driven. It is part of the command when a column address is driven.
PGPL0	Output	Bus UPM General-Purpose Line 0 One of six general-purpose output lines of the UPM. The values and timing of this pin are programmed in the UPM.
$\overline{\text{PSDWE}}$	Output	Bus SDRAM Write Enable Output from the bus SDRAM controller. This pin should connect to the SDRAM WE input signal.
PGPL1	Output	Bus UPM General-Purpose Line 1 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.
$\overline{\text{POE}}$	Output	Bus Output Enable Output of the bus GPCM. Controls the output buffer of memory devices during read operations.
$\overline{\text{PSDRAS}}$	Output	Bus SDRAM RAS Output from the bus SDRAM controller. This pin should connect to the SDRAM Row Address Strobe (RAS) input signal.
PGPL2	Output	Bus UPM General-Purpose Line 2 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.
$\overline{\text{PSDCAS}}$	Output	Bus SDRAM CAS Output from the bus SDRAM controller. This pin should connect to the SDRAM Column Address Strobe (CAS) input signal.
PGPL3	Output	Bus UPM General-Purpose Line 3 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.
$\overline{\text{PGTA}}$	Input	GPCM TA Terminates transactions during GPCM operation. Requires an external pull up resistor for proper operation.
PUPMWAIT	Input	Bus UPM Wait Input to the UPM. An external device can hold this pin high to force the UPM to wait until the device is ready for the operation to continue.
$\overline{\text{PPBS}}$	Output	Bus Parity Byte Select In systems that store data parity in a separate chip, this output is the byte-select for that chip.
PGPL4	Output	Bus UPM General-Purpose Line 4 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.
PSDAMUX	Output	Bus SDRAM Address Multiplexer Controls the SDRAM address multiplexer when the MSC8101 is in External Master mode.
PGPL5	Output	Bus UPM General-Purpose Line 5 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.

1.6 CPM Ports

The MSC8101 CPM supports the subset of MPC8260 signals as described below.

- The MSC8101 CPM includes the following set of communication controllers:
- Two full-duplex fast serial communications controllers (FCCs) that support:
 - Asynchronous transfer mode (ATM) through a UTOPIA 8 interface (FCC1 only)—The MSC8101 can operate as one of the following:
 - UTOPIA slave device
 - UTOPIA multi-PHY master device using direct polling for up to 4 PHY devices
 - UTOPIA multi-PHY master device using multiplex polling that can address up to 31 PHY devices at addresses 0–30 (address 31 is reserved as a null port).
 - IEEE 802.3/Fast Ethernet through a Media-Independent Interface (MII)
 - High-level data link control (HDLC) Protocol:
 - Serial mode—Transfers data one bit at a time
 - Nibble mode—Transfers data four bits at a time
 - Transparent mode serial operation
- One FCC that operates with the TSA only
- Two multi-channel controllers (MCCs) that together can handle up to 256 HDLC/transparent channels at 64 Kbps each, multiplexed on up to four TDM interfaces
- Two full-duplex serial communications controllers (SCCs) that support the following protocols:
 - IEEE 802.3/fast Ethernet through a media-independent interface (MII)
 - HDLC Protocol:
 - Serial mode—Transfers data one bit at a time
 - Nibble mode—Transfers data four bits at a time
 - Synchronous data link control (SDLC)
 - LocalTalk (HDLC-based local area network protocol)
 - Universal asynchronous receiver/transmitter (UART)
 - Synchronous UART (1x clock mode)
 - Binary synchronous (BISYNC) communication
 - Transparent mode serial operation
- Two additional SCCs that operate with the TSA only
- Two full-duplex serial management controllers (SMCs) that support the following protocols:
 - General circuit interface (GCI)/integrated services digital network (ISDN) monitor and C/I channels (TSA only)
 - UART
 - Transparent mode serial operation
- Serial peripheral interface (SPI) support for master or slave operation
- Inter-integrated circuit (I²C) bus controller
- Time-slot assigner (TSA) that supports multiplexing from any of the SCCs, FCCs, SMCs, and two MCCs onto four time-division multiplexed (TDM) interfaces. The TSA uses two serial interfaces (SI1 and SI2). SI1 uses TDMA1 which supports both serial and nibble mode. SI2 does not support nibble mode and includes TDMB2, TDMC2, and TDMD2, which operate only in serial mode.

The individual sets of external signals associated with a specific protocol and data transfer mode are multiplexed across any or all of the ports, as shown in **Figure 1-2**. The following sections describe the signals supported by Ports A–D.

1.6.1 Port A Signals

Table 1-7. Port A Signals

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA31	FCC1: $\overline{\text{TXENB}}$ <i>UTOPIA master</i>	Output	FCC1: UTOPIA Master Transmit Enable Asserted by the MSC8101 (UTOPIA master PHY) when there is valid transmit cell data (TXD[0–7]).
	FCC1: $\overline{\text{TXENB}}$ <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Slave Transmit Enable Asserted by an external UTOPIA master PHY when there is valid transmit cell data (TXD[0–7]).
	FCC1: COL <i>MII</i>	Input	FCC1: Media Independent Interface Collision Detect Asserted by an external fast Ethernet PHY when collision is detected.
PA30	FCC1: TXCLAV <i>UTOPIA slave</i>	Output	FCC1: UTOPIA Slave Transmit Cell Available Asserted by the MSC8101 (UTOPIA slave PHY) when the MSC8101 can accept one complete ATM cell.
	FCC1: TXCLAV <i>UTOPIA master, or</i>	Input	FCC1: UTOPIA Master Transmit Cell Available Asserted by an external UTOPIA slave PHY to indicate that it can accept one complete ATM cell.
	FCC1: TXCLAV0 <i>UTOPIA master, Multi-PHY, direct polling</i>	Input	FCC1: UTOPIA Master Transmit Cell Available Multi-PHY Direct Polling Asserted by an external UTOPIA slave PHY using direct polling to indicate that it can accept one complete ATM cell.
	FCC1: $\overline{\text{RTS}}$ <i>HDLC, Serial and Nibble</i>	Output	FCC1: Request To Send In the standard modem interface signals supported by FCC1 ($\overline{\text{RTS}}$, $\overline{\text{CTS}}$, and $\overline{\text{CD}}$), $\overline{\text{RTS}}$ is asynchronous with the data. $\overline{\text{RTS}}$ is typically used in conjunction with $\overline{\text{CD}}$. The MSC8101 FCC1 transmitter requests the receiver to send data by asserting $\overline{\text{RTS}}$ low. The request is accepted when $\overline{\text{CTS}}$ is returned low.
PA29	FCC1: TXSOC <i>UTOPIA master</i>	Output	FCC1: UTOPIA Transmit Start of Cell Asserted by the MSC8101 (UTOPIA master PHY) when TXD[0–7] contains the first valid byte of the cell.
	FCC1: TX_ER <i>MII</i>	Output	FCC1: Media Independent Interface Transmit Error Asserted by the MSC8101 to force propagation of transmit errors.
PA28	FCC1: $\overline{\text{RXENB}}$ <i>UTOPIA master</i>	Output	FCC1: UTOPIA Master Receive Enable Asserted by the MSC8101 (UTOPIA master PHY) to indicate that RXD[0–7] and RXSOC are to be sampled at the end of the next cycle. RXD[0–7] and RXSOC are enabled only in cycles following those with $\overline{\text{RXENB}}$ asserted.
	FCC1: $\overline{\text{RXENB}}$ <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Master Receive Enable Asserted by an external PHY to indicate that RXD[0–7] and RXSOC is to be sampled at the end of the next cycle. RXD[0–7] and RXSOC are enabled only in cycles following those with $\overline{\text{RXENB}}$ asserted.
	FCC1: TX_EN <i>MII</i>	Output	FCC1: Media Independent Interface Transmit Enable Asserted by the MSC8101 when transmitting data.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA27	FCC1: RXSOC <i>UTOPIA slave</i>	Output	FCC1: UTOPIA Receive Start of Cell Asserted by the MSC8101 (UTOPIA slave) for an external PHY when RXD[0–7] contains the first valid byte of the cell.
	FCC1: RX_DV <i>MII</i>	Input	FCC1: Media Independent Interface Receive Data Valid Asserted by an external fast Ethernet PHY to indicate that valid data is being sent. The presence of carrier sense but not RX_DV indicates reception of broken packet headers, probably due to bad wiring or a bad circuit.
PA26	FCC1: RXCLAV <i>UTOPIA slave</i>	Output	FCC1: UTOPIA Slave Receive Cell Available Asserted by the MSC8101 (UTOPIA slave PHY) when one complete ATM cell is available for transfer.
	FCC1: RXCLAV <i>UTOPIA master, or</i>	Input	FCC1: UTOPIA Master Receive Cell Available Asserted by an external PHY when one complete ATM cell is available for transfer.
	RXCLAV0 <i>UTOPIA master, Multi-PHY, direct polling</i>	Input	FCC1: UTOPIA Master Receive Cell Available 0 Direct Polling Asserted by an external PHY when one complete ATM cell is available for transfer.
	FCC1: RX_ER <i>MII</i>	Input	FCC1: Media Independent Interface Receive Error Asserted by an external fast Ethernet PHY to indicate a receive error, which often indicates bad wiring.
PA25	FCC1: TXD0 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 0 The MSC8101 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. TXD0 is the least significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	SDMA: MSNUM0	Output	Module Serial Number Bit 0 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA24	FCC1: TXD1 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 1 The MSC8101 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 1 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	SDMA: MSNUM1	Output	Module Serial Number Bit 1 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA23	FCC1: TXD2 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 2 The MSC8101 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 2 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA22	FCC1: TXD3 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 3 The MSC8101 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 3 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
PA21	FCC1: TXD4 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 4 The MSC8101 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 4 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	FCC1: TXD3 <i>MII and HDLC nibble</i>	Output	FCC1: MII and HDLC Nibble Transmit Data Bit 3 TXD[3–0] supports MII and HDLC nibble modes in FCC1. TXD3 is the most significant bit.
PA20	FCC1: TXD5 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 5 The MSC8101 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 5 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	FCC1: TXD2 <i>MII and HDLC nibble</i>	Output	FCC1: MII and HDLC Nibble Transmit Data Bit 2 TXD[3–0] is supported by MII and HDLC nibble modes in FCC1. This is bit 2 of the transmit data. TXD3 is the most significant bit.
PA19	FCC1: TXD6 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 6 The MSC8101 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 6 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	FCC1: TXD1 <i>MII and HDLC nibble</i>	Output	FCC1: MII and HDLC Nibble Transmit Data Bit 1 TXD[3–0] is supported by MII and HDLC transparent nibble modes in FCC1. This is bit 1 of the transmit data. TXD3 is the most significant bit.
PA18	FCC1: TXD7 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 7. The MSC8101 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	FCC1: TXD0 <i>MII and HDLC nibble</i>	Output	FCC1: MII and HDLC Nibble Transmit Data Bit 0 TXD[3–0] is supported by MII and HDLC nibble modes in FCC1. TXD0 is the least significant bit.
	FCC1: TXD <i>HDLC serial and transparent</i>	Output	FCC1: HDLC Serial and Transparent Transmit Data Bit This is the single transmit data bit in supported by HDLC serial and transparent modes.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA17	FCC1: RXD7 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 7. The MSC8101 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. RXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	FCC1: RXD0 <i>MII and HDLC nibble</i>	Input	FCC1: MII and HDLC Nibble Receive Data Bit 0 RXD[3–0] is supported by MII and HDLC nibble mode in FCC1. RXD0 is the least significant bit.
	FCC1: RXD <i>HDLC serial and transparent</i>	Input	FCC1: HDLC Serial and Transparent Receive Data Bit This is the single receive data bit supported by HDLC and transparent modes.
PA16	FCC1: RXD6 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 6. The MSC8101 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. This is bit 6 of the receive data. RXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	FCC1: RXD1 <i>MII and HDLC nibble</i>	Input	FCC1: MII and HDLC Nibble Receive Data Bit 1 This is bit 1 of the receive nibble data. RXD3 is the most significant bit.
PA15	FCC1: RXD5 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 5 The MSC8101 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. This is bit 5 of the receive data. RXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	RXD2 <i>MII and HDLC nibble</i>	Input	FCC1: MII and HDLC Nibble Receive Data Bit 2 This is bit 2 of the receive nibble data. RXD3 is the most significant bit.
PA14	FCC1: RXD4 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 4. The MSC8101 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. RXD7 is the most significant bit. RXD0 is the least significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	FCC1: RXD3 <i>MII and HDLC nibble</i>	Input	FCC1: MII and HDLC Nibble Receive Data Bit 3 RXD3 is the most significant bit of the receive nibble bit.
PA13	FCC1: RXD3 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 3 The MSC8101 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. RXD7 is the most significant bit. RXD0 is the least significant bit. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	SDMA: MSNUM2	Output	Module Serial Number Bit 2 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA12	FCC1: RXD2 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 2 The MSC8101 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. This is bit 2 of the receive data. RXD7 is the most significant bit. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when \overline{RXENB} is asserted.
	SDMA: MSNUM3	Output	Module Serial Number Bit 3 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA11	FCC1: RXD1 <i>UTOPIA</i>	Input	FCC1: UTOPIA RX Receive Data Bit 1 The MSC8101 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. This is bit 1 of the receive data. RXD7 is the most significant bit. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when \overline{RXENB} is asserted.
	SDMA: MSNUM4	Output	Module Serial Number Bit 4 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA10	FCC1: RXD0 <i>UTOPIA</i>	Input	FCC1: UTOPIA RX Receive Data Bit 0 The MSC8101 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. RXD0 is the least significant bit of the receive data. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when \overline{RXENB} is asserted.
	SDMA: MSNUM5	Output	Module Serial Number Bit 5 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA9	SMC2: SMTXD	Output	SMC2: Serial Management Transmit Data The SMC interface consists of SMTXD, SMRXD, \overline{SMSYN} , and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that supports three protocols or modes: UART, transparent, or general-circuit interface (GCI). See also PC15.
	SI1 TDMA1: L1TXD0 <i>TDM nibble</i>	Output	Time-Division Multiplexing A1: Layer 1 Transmit Data Bit 0 L1TXD0 is the least significant bit of the TDM nibble data.
PA8	SMC2: SMRXD	Input	SMC2: Serial Management Receive Data The SMC interface consists of SMTXD, SMRXD, \overline{SMSYN} , and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that supports three protocols or modes: UART, transparent, or general-circuit interface (GCI).
	SI1 TDMA1: L1RXD0 <i>TDM nibble</i>	Input	Time-Division Multiplexing A1: Layer 1 Nibble Receive Data Bit 0 L1RXD0 is the least significant bit received in nibble mode.
	SI1 TDMA1: L1RXD <i>TDM serial</i>	Input	Time-Division Multiplexing A1: Layer 1 Serial Receive Data TDMA1 receives serial data from L1RXD.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA7	SMC2: SMSYN	Input	SMC2: Serial Management Synchronization The SMC interface consists of SMTXD, SMRXD, SMSYN, and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that supports three protocols or modes: UART, transparent, or general-circuit interface (GCI).
	SI1 TDMA1: L1TSYNC <i>TDM nibble and TDM serial</i>	Input	Time-Division Multiplexing A1: Layer 1 Transmit Synchronization The synchronizing signal for the transmit channel. See the <i>Serial Interface with time-slot assigner</i> chapter in the <i>MSC8101 Reference Manual</i> .
PA6	SI1 TDMA1: L1RSYNC <i>TDM nibble and TDM serial</i>	Input	Time-Division Multiplexing A1: Layer 1 Receive Synchronization. The synchronizing signal for the receive channel.

1.6.2 Port B Signals

Table 1-8. Port B Signals

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PB31	FCC2: TX_ER <i>MII</i>	Output	FCC2: Media Independent Interface Transmit Error Asserted by the MSC8101 to force propagation of transmit errors.
	SCC2: RXD	Input	SCC2: Receive Data SCC2 receives serial data from RXD.
	SI2 TDMB2: L1TXD <i>TDM serial</i>	Output	Time-Division Multiplexing B2: Layer 1 Transmit Data TDMB2 transmits serial data out of L1TXD.
PB30	SCC2: TXD	Output	SCC2: Transmit Data. SCC2 transmits serial data out of TXD.
	FCC2: RX_DV <i>MII</i>	Input	FCC2: Media Independent Interface Receive Data Valid Asserted by an external fast Ethernet PHY to indicate that valid data is being sent. The presence of carrier sense, but not RX_DV, indicates reception of broken packet headers, probably due to bad wiring or a bad circuit.
	SI2 TDMB2: L1RXD <i>TDM serial</i>	Input	Time-Division Multiplexing B2: Layer 1 Receive Data TDMB2 receives serial data from L1RXD.
PB29	FCC2: TX_EN <i>MII</i>	Output	FCC2: Media Independent Interface Transmit Enable Asserted by the MSC8101 when transmitting data.
	SI2 TDMB2: L1RSYNC <i>TDM serial</i>	Input	Time-Division Multiplexing B2: Layer 1 Receive Synchronization The synchronizing signal for the receive channel.

Table 1-8. Port B Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PB28	FCC2: $\overline{\text{RTS}}$ <i>HDLC serial, HDLC nibble, and transparent</i>	Output	FCC2: Request to Send One of the standard modem interface signals supported by FCC2 ($\overline{\text{RTS}}$, $\overline{\text{CTS}}$, and $\overline{\text{CD}}$). $\overline{\text{RTS}}$ is asynchronous with the data. $\overline{\text{RTS}}$ is typically used in conjunction with $\overline{\text{CD}}$. The MSC8101 FCC2 transmitter requests the receiver to send data by asserting $\overline{\text{RTS}}$ low. The request is accepted when $\overline{\text{CTS}}$ is returned low.
	FCC2: RX_ER <i>MII</i>	Input	FCC2: Media Independent Interface Receive Error Asserted by an external fast Ethernet PHY to indicate a receive error, which often indicates bad wiring.
	SCC2: $\overline{\text{RTS}}$, TENA	Output	SCC2: Request to Send, Transmit Enable Typically used in conjunction with $\overline{\text{CD}}$ supported by SCC2. The MSC8101 SCC2 transmitter requests the receiver to send data by asserting $\overline{\text{RTS}}$ low. The request is accepted when $\overline{\text{CTS}}$ is returned low. TENA is the signal used in Ethernet mode.
	SI2 TDMB2: L1TSYNC <i>TDM serial</i>	Input	Time-Division Multiplexing B2: Layer 1 Transmit Synchronization The synchronizing signal for the transmit channel. See the serial interface with time-slot assigner chapter in the <i>MSC8101 Reference Manual</i> .
PB27	FCC2: COL <i>MII</i>	Input	FCC2: Media Independent Interface Collision Detect Asserted by an external fast Ethernet PHY when a collision is detected.
	SI2 TDMC2: L1TXD <i>TDM serial</i>	Output	Time-Division Multiplexing C2: Layer 1 Transmit Data TDMC2 transmits serial data out of L1TXD.
PB26	FCC2: CRS <i>MII</i>	Input	FCC2: Media Independent Interface Carrier Sense Input Asserted by an external fast Ethernet PHY to indicate activity on the cable.
	SI2 TDMC2: L1RXD <i>TDM serial</i>	Input	Time-Division Multiplexing C2: Layer 1 Receive Data TDMC2 receives serial data from L1RXD.
PB25	FCC2: TXD3 <i>MII and HDLC nibble</i>	Output	FCC2: MII and HDLC Nibble Transmit Data Bit 3 TXD3 is bit 3 and the most significant bit of the transmit data nibble.
	SI1 TDMA1: L1TXD3 <i>TDM nibble</i>	Output	Time-Division Multiplexing A1: Nibble Layer 1 Transmit Data Bit 3 L1TXD3 is bit 3 and the most significant bit of the transmit data nibble.
	SI2 TDMC2: L1TSYNC <i>TDM serial</i>	Input	Time-Division Multiplexing C2: Layer 1 Transmit Synchronization The synchronizing signal for the transmit channel. See the <i>Serial Interface with Time-Slot Assigner</i> chapter in the <i>MSC8101 Reference Manual</i> .
PB24	FCC2: TXD2 <i>MII and HDLC nibble</i>	Output	FCC2: MII and HDLC Nibble: Transmit Data Bit 2 TXD2 is bit 2 of the transmit data nibble.
	SI1 TDMA1: L1RXD3 <i>nibble</i>	Input	Time-Division Multiplexing A1: Nibble Layer 1 Receive Data Bit 3 L1RXD3 is bit 3 and the most significant bit of the receive data nibble.
	SI2 TDMC2: L1RSYNC <i>serial</i>	Input	Time-Division Multiplexing C2: Layer 1 Receive Synchronization The synchronizing signal for the receive channel.

Table 1-8. Port B Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PB23	FCC2: TXD1 <i>MII and HDLC nibble</i>	Output	FCC2: MII and HDLC Nibble: Transmit Data Bit 1 TXD1 is bit 1 of the transmit data nibble.
	SI1 TDMA1: L1RXD2 <i>TDM nibble</i>	Input	Time-Division Multiplexing A1: Nibble Layer 1 Receive Data Bit 2 L1RXD2 is bit 2 of the receive data nibble.
	SI2 TDMD2: L1TXD <i>TDM serial</i>	Output	Time-Division Multiplexing D2: Layer 1 Transmit Data TDMA1 transmits serial data out of L1TXD.
PB22	FCC2: TXD0 <i>MII and HDLC nibble</i>	Output	FCC2: MII and HDLC Nibble Transmit Data Bit 0 TXD0 is bit 0 and the least significant bit of the transmit data nibble.
	FCC2: TXD <i>HDLC serial and transparent</i>	Output	FCC2: HDLC Serial and Transparent Transmit Data Serial data is transmitted via TXD.
	SI1 TDMA1: L1RXD1 <i>TDM nibble</i>	Input	Time-Division Multiplexing A1: Nibble Layer 1 Receive Data Bit 1 L1RXD1 is bit 1 of the receive data nibble.
	SI2 TDMD2: L1RXD <i>TDM serial</i>	Input	Time-Division Multiplexing D2: Layer 1 Receive Data Serial data is received via L1RXD.
PB21	FCC2: RXD0 <i>MII and HDLC nibble</i>	Input	FCC2: MII and HDLC Nibble Receive Data Bit 0 RXD0 is bit 0 and the least significant bit of the receive data nibble.
	FCC2: RXD <i>HDLC serial and transparent</i>	Input	FCC2: HDLC Serial and Transparent Receive Data Serial data is received via RXD.
	SI1 TDMA1: L1TXD2 <i>TDM nibble</i>	Output	Time-Division Multiplexing A1: Nibble Layer 1 Transmit Data Bit 2 L1TXD2 is bit 2 of the transmit data nibble.
	SI2 TDMD2: L1TSYNC <i>TDM serial</i>	Input	Time-Division Multiplexing D2: Layer 1 Transmit Synchronize Data The synchronizing signal for the transmit channel. See the <i>Serial Interface with Time-Slot Assigner</i> chapter in the <i>MSC8101 Reference Manual</i> .
PB20	FCC2: RXD1 <i>MII and HDLC nibble</i>	Input	FCC2: MII and HDLC Nibble: Receive Data Bit 1 RXD1 is bit 1 of the receive data nibble.
	SI1 TDMA1: L1TXD1 <i>TDM nibble</i>	Output	Time-Division Multiplexing A1: Nibble Layer 1 Transmit Data Bit 1 L1TXD1 is bit 1 of the transmit data nibble.
	SI2 TDMD2: L1RSYNC <i>TDM serial</i>	Input	Time-Division Multiplexing D2: Layer 1 Receive Synchronize Data The synchronizing signal for the receive channel.
PB19	FCC2: RXD2 <i>MII and HDLC nibble</i>	Input	FCC2: MII and HDLC Nibble Receive Data Bit 2 RXD2 is bit 2 of the receive data nibble.
	I ² C: SDA	Input/ Output	I²C: Inter-Integrated Circuit Serial Data The I ² C interface comprises two signals: serial data (SDA) and serial clock (SCL). The I ² C controller uses a synchronous, multimaster bus that can connect several integrated circuits on a board. Clock rates run up to 520 kHz @ 25 MHz system clock.

Table 1-8. Port B Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PB18	FCC2: RXD3 <i>MII and HDLC nibble</i>	Input	FCC2: MII and HDLC Nibble Receive Data Bit 3 RXD3 is bit 3 and the most significant bit of the receive data nibble.
	I ² C: SCL	Input/Output	I²C: Inter-Integrated Circuit Serial Clock The I ² C interface comprises two signals: serial data (SDA) and serial clock (SDA). The I ² C controller uses a synchronous, multimaster bus that can connect several integrated circuits on a board. Clock rates run up to 520 kHz @ 25 MHz system clock.

1.6.3 Port C Signals

Table 1-9. Port C Signals

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC31	BRG1O	Output	Baud-Rate Generator 1 Output The CPM supports up to 8 BRGs used internally by the bank-of-clocks selection logic and/or to provide an output to one of the 8 BRG pins. BRG1O can be the internal input to the SIU timers. When CLK5 is selected (see PC27 below), it is the source for BRG1O which is the default input for the SIU timers. See the system interface unit (SIU) chapter in the <i>MSC8101 Reference Manual</i> for additional information. If CLK5 is not enabled, BRG1O uses an internal input. If TMCLK is enabled (see PC26 below), the BRG1O input to the SIU timers is disabled.
	CLK1	Input	Clock 1 The CPM supports up to 10 clock input pins sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	TIMER1/2: $\overline{\text{TGATE1}}$	Input	Timer 1/2: Timer Gate 1 The timers can be <u>gated</u> /restarted by an external gate signal. There are two gate signals: $\overline{\text{TGATE1}}$ controls timer 1 and/or 2 and $\overline{\text{TGATE2}}$ controls timer 3 and/or 4.

Table 1-9. Port C Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC30	BRG2O	Output	Baud-Rate Generator 2 Output The CPM supports up to 8 BRGs used internally by the bank-of-clocks selection logic and/or to provide an output to one of the 8 BRG pins.
	CLK2	Input	Clock 2 The CPM supports up to 10 clock input pins sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	Timer1: $\overline{\text{TOUT1}}$	Output	Timer 1: Timer Out 1 The timers (Timer[1–4]) can output a signal on a timer output ($\overline{\text{TOUT}}[1–4]$) when the reference value is reached. This signal can be an active-low pulse or a toggle of the current output. The output can also connect internally to the input of another timer, resulting in a 32-bit timer.
	EXT1	Input	External Request 1 Asserts an internal request to the CPM processor. The signal can be programmed as level- or edge-sensitive, and also has programmable priority. Refer to the RISC Controller Configuration Register (RCCR) description in the Chapter 17 of the <i>MSC8101 Reference Manual</i> for programming information. There are no current microcode applications for this request line. It is reserved for future development.
PC29	BRG3O	Output	Baud-Rate Generator 3 Output The CPM supports up to 8 BRGs used internally by the bank-of-clocks selection logic and/or to provide an output to one of the 8 BRG pins.
	CLK3	Input	Clock 3 The CPM supports up to 10 clock input pins sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	TIN2	Input	Timer Input 2 A timer can have one of the following sources: another timer, system clock, system clock divided by 16 or a timer input. The CPM supports up to 4 timer inputs. The timer inputs can be captured on the rising, falling or both edges.
	SCC1: $\overline{\text{CTS}}$, CLSN	Input	SCC1: Clear to Send, Collision Typically used in conjunction with $\overline{\text{RTS}}$. The MSC8101 SCC1 transmitter sends out a request to send data signal ($\overline{\text{RTS}}$). The request is accepted when $\overline{\text{CTS}}$ is returned low. CLSN is the signal used in Ethernet mode. See also PC15.

Table 1-9. Port C Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC28	BRG4O	Output	Baud-Rate Generator 4 Output The CPM supports up to 8 BRGs used internally by the bank-of-clocks selection logic and/or to provide an output to one of the 8 BRG pins.
	CLK4	Input	Clock 4 The CPM supports up to 10 clock input pins sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	TIN1	Input	Timer Input 1 A timer can have one of the following sources: another timer, system clock, system clock divided by 16 or a timer input. The CPM supports up to 4 timer inputs. The timer inputs can be captured on the rising, falling or both edges.
	Timer2: $\overline{\text{TOUT2}}$	Output	Timer 2: Timer Output 2 The timers (Timer[1–4]) can output a signal on a timer output ($\overline{\text{TOUT[1–4]}}$) when the reference value is reached. This signal can be an active-low pulse or a toggle of the current output. The output can also be connected internally to the input of another timer, resulting in a 32-bit timer.
	SCC2: $\overline{\text{CTS}}$, CLSN	Input	SCC2: Clear to Send, Collision Typically used in conjunction with $\overline{\text{RTS}}$. The MSC8101 SCC2 transmitter sends out a request to send data signal ($\overline{\text{RTS}}$). The request is accepted when $\overline{\text{CTS}}$ is returned low. CLSN is the signal used in Ethernet mode. See also PC13.
PC27	BRG5O	Output	Baud-Rate Generator 5 Output The CPM supports up to 8 BRGs used internally by the bank-of-clocks selection logic and/or to provide an output to one of the 8 BRG pins.
	CLK5	Input	Clock 5 When selected, CLK5 is a source for the SIU timers via BRG10. See the <i>System Interface Unit (SIU)</i> chapter in the <i>MSC8101 Reference Manual</i> for additional information. If CLK5 is not enabled, BRG10 uses an internal input. If TMCLK is enabled (see PC26 below), the BRG10 input to the SIU timers is disabled.
	TIMER3/4: $\overline{\text{TGATE2}}$	Input	Timer 3/4: Timer Gate 2 The timers can be gated/restarted by an external gate signal. There are two gate signals: $\overline{\text{TGATE1}}$ controls timer 1 and/or 2 and $\overline{\text{TGATE2}}$ controls timer 3 and/or 4.

Table 1-9. Port C Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC26	BRG6O	Output	Baud-Rate Generator 6 Output The CPM supports up to 8 BRGs used internally by the bank-of-clocks selection logic and/or provide an output to one of the 8 BRG pins.
	CLK6	Input	Clock 6 The CPM supports up to 10 clock input pins sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	Timer3: $\overline{\text{TOUT3}}$	Output	Timer 3: Timer Out 3 The timers (Timer[1–4]) can output a signal on a timer output ($\overline{\text{TOUT}}[1–4]$) when the reference value is reached. This signal can be an active-low pulse or a toggle of the current output. The output can also connect internally to the input of another timer, resulting in a 32-bit timer.
	TMCLK	Input	Timer Clock When selected, TMCLK is the designated input to the SIU timers. When TMCLK is configured as the input to the SIU timers, the BRG1O input is disabled. See the <i>System Interface Unit (SIU)</i> chapter in the <i>MSC8101 Reference Manual</i> for additional information.
PC25	BRG7O	Output	Baud-Rate Generator 7 Output The CPM supports up to 8 BRGs used internally by the bank-of-clocks selection logic and/or provide an output to one of the 8 BRG pins.
	CLK7	Input	Clock 7 The CPM supports up to 10 clock input pins sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	TIN4	Input	Timer Input 4 A timer can have one of the following sources: another timer, system clock, system clock divided by 16 or a timer input. The CPM supports up to 4 timer inputs. The timer inputs can be captured on the rising, falling or both edges.
	DMA: $\overline{\text{DACK2}}$	Output	DMA: Data Acknowledge 2 $\overline{\text{DACK2}}$, $\overline{\text{DREQ2}}$, $\overline{\text{DRACK2}}$ and $\overline{\text{DONE2}}$ belong to the SIU DMA controller. $\overline{\text{DONE2}}$ and $\overline{\text{DRACK2}}$ are signals on the same pin and therefore cannot be used simultaneously. There are two sets of DMA pins associated with the PIO ports.

Table 1-9. Port C Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC24	BRG8O	Output	Baud-Rate Generator 8 Output The CPM supports up to 8 BRGs used internally by the bank-of-clocks selection logic and/or to provide an output to one of the 8 BRG pins.
	CLK8	Input	Clock 8 The CPM supports up to 10 clock input pins. The clocks are sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	TIN3	Input	Timer Input 3 A timer can have one of the following sources: another timer, system clock, system clock divided by 16, or a timer input. The CPM supports up to four timer inputs. The timer inputs can be captured on the rising, falling, or both edges.
	Timer4: $\overline{\text{TOUT4}}$	Output	Timer 4: Timer Out 4 The timers (Timer1–4) can output a signal on a timer output ($\overline{\text{TOUT}}[1-4]$) when the reference value is reached. This signal can be an active-low pulse or a toggle of the current output. The output can also be connected internally to the input of another timer, resulting in a 32-bit timer.
	DMA: DREQ2	Input	DMA: Data Request 2 $\overline{\text{DACK2}}$, $\overline{\text{DREQ2}}$, $\overline{\text{DRACK2}}$, and $\overline{\text{DONE2}}$ belong to the SIU DMA controller. $\overline{\text{DONE2}}$ and $\overline{\text{DRACK2}}$ are signals on the same pin and therefore cannot be used simultaneously. There are two sets of DMA pins associated with the PIO ports.
PC23	CLK9	Input	Clock 9 The CPM supports up to 10 clock input pins sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	DMA: $\overline{\text{DACK1}}$	Output	DMA: Data Acknowledge 1 $\overline{\text{DACK1}}$, $\overline{\text{DREQ1}}$, $\overline{\text{DRACK1}}$, and $\overline{\text{DONE1}}$ belong to the SIU DMA controller. $\overline{\text{DONE1}}$ and $\overline{\text{DRACK1}}$ are signals on the same pin and therefore cannot be used simultaneously. There are two sets of DMA pins associated with the PIO ports.
	EXT2	Input	External Request 2 External request input line 2 asserts an internal request to the CPM processor. The signal can be programmed as level- or edge-sensitive, and also has programmable priority. Refer to the risc controller configuration register (RCCR) description in the Chapter 17 of the <i>MSC8101 Reference Manual</i> for programming information. There are no current microcode applications for this request line. It is reserved for future development.

Table 1-9. Port C Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC22	SI1: L1ST1	Output	Serial Interface 1: Layer 1 Strobe 1 The MSC8101 time-slot assigner supports up to four strobe outputs that can be asserted on a bit or byte basis. The strobe outputs are useful for interfacing to other devices that do not support the multiplexed interface or for enabling/disabling three-state I/O buffers in a multiple-transmitter architecture. These strobes can also generate output wave forms for such applications as stepper-motor control.
	CLK10	Input	Clock 10 The CPM supports up to 10 clock input pins sent to the bank-of-clocks selection logic, where they can be routed to the controllers.
	DMA: DREQ1	Input/ Output	DMA: Request 1 $\overline{DACK1}$, $\overline{DREQ1}$, $\overline{DRACK1}$, and $\overline{DONE1}$ belong to the SIU DMA controller. $\overline{DONE1}$ and $\overline{DRACK1}$ are signals on the same pin and therefore cannot be used simultaneously. There are two sets of DMA pins associated with the PIO ports.
PC15	SMC2: SMTXD	Output	SMC2: Serial Management Transmit Data The SMC interface consists of SMTXD, SMRXD, SMSYN, and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that support three protocols or modes: UART, transparent, or general-circuit interface (GCI). See also PA9.
	SCC1: \overline{CTS} /CLSN	Input	SCC1: Clear To Send, Collision Typically used in conjunction with \overline{RTS} . The MSC8101 SCC1 transmitter sends out a request to send data signal (\overline{RTS}). The request is accepted when \overline{CTS} is returned low. CLSN is the signal used in Ethernet mode. See also PC29.
	FCC1: TXADDR0 <i>UTOPIA master</i>	Output	FCC1: UTOPIA Master Transmit Address Bit 0 This is master transmit address bit 0.
	FCC1: TXADDR0 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Slave Transmit Address Bit 0 This is slave transmit address bit 0.
PC14	SI1: L1ST2	Output	Serial Interface 1: Layer 1 Strobe 2 The MSC8101 time-slot assigner supports up to four strobe outputs that can be asserted on a bit or byte basis. The strobe outputs are useful for interfacing to other devices that do not support the multiplexed interface or for enabling/disabling three-state I/O buffers in a multiple-transmitter architecture. These strobes can also be generate output wave forms for such applications as stepper-motor control.
	SCC1: \overline{CD} , RENA	Input	SCC1: Carrier Detect, Receive Enable Typically used in conjunction with \overline{RTS} supported by SCC1. The MSC8101MSC8101 SCC1 transmitter requests the receiver to send data by asserting \overline{RTS} low. The request is accepted when \overline{CTS} is returned low.
	FCC1: RXADDR0 <i>UTOPIA master</i>	Output	FCC1: UTOPIA Multi-PHY Master Receive Address Bit 0 This is master receive address bit 0.
	FCC1: RXADDR0 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Multi-PHY Slave Receive Address Bit 0 This is slave receive address bit 0.

Table 1-9. Port C Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC13	SI1: L1ST4	Output	Serial Interface 1: Layer 1 Strobe 4 The MSC8101 time-slot assigner supports up to four strobe outputs that can be asserted on a bit or byte basis. The strobe outputs are useful for interfacing to other devices that do not support the multiplexed interface or for enabling/disabling three-state I/O buffers in a multiple-transmitter architecture. These strobes can also generate output wave forms for such applications as stepper-motor control.
	SCC2: $\overline{\text{CTS}}$, CLSN	Input	SCC2: Clear to Send, Collision Typically used in conjunction with $\overline{\text{RTS}}$. The MSC8101 SCC2 transmitter sends out a request to send data signal ($\overline{\text{RTS}}$). The request is accepted when $\overline{\text{CTS}}$ is returned low. CLSN is the signal used in Ethernet mode. See also PC28.
	FCC1: TXADDR1 <i>UTOPIA master</i>	Output	FCC1: UTOPIA Multi-PHY Master Transmit Address Bit 1 This is master transmit address bit 1.
	FCC1: TXADDR1 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Multi-PHY Slave Transmit Address Bit 1 This is slave transmit address bit 1.
PC12	SI1: L1ST3	Output	Serial Interface 1: Layer 1 Strobe 3 The MSC8101 time-slot assigner supports up to four strobe outputs that can be asserted on a bit or byte basis. The strobe outputs are useful for interfacing to other devices that do not support the multiplexed interface or for enabling/disabling three-state I/O buffers in a multiple-transmitter architecture. These strobes can also generate output wave forms for such applications as stepper-motor control.
	SCC2: $\overline{\text{CD}}$, RENA	Input	SCC2: Carrier Detect, Request Enable Typically used in conjunction with $\overline{\text{RTS}}$ supported by SCC2. The MSC8101 SCC2 transmitter requests to the receiver that it sends data by asserting $\overline{\text{RTS}}$ low. The request is accepted when $\overline{\text{CTS}}$ is returned low.
	FCC1: RXADDR1 <i>UTOPIA master</i>	Output	FCC1: UTOPIA Multi-PHY Master Receive Address Bit 1 This is master receive address bit 1.
	FCC1: RXADDR1 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Multi-PHY Slave Receive Address Bit 1 This is slave receive address bit 1.

Table 1-9. Port C Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC7	SI2: L1ST1	Output	Serial Interface 2: Strobe 1 The MSC8101 time-slot assigner supports up to four strobe outputs that can be asserted on a bit or byte basis. The strobe outputs are useful for interfacing to other devices that do not support the multiplexed interface or for enabling/disabling three-state I/O buffers in a multiple-transmitter architecture. These strobes can also generate output wave forms for such applications as stepper-motor control.
	FCC1: $\overline{\text{CTS}}$ <i>HDLC serial, HDLC nibble, and transparent</i>	Input	FCC1: Clear To Send In the standard modem interface signals supported by FCC1 ($\overline{\text{RTS}}$, $\overline{\text{CTS}}$, and $\overline{\text{CD}}$). $\overline{\text{CTS}}$ is asynchronous with the data.
	FCC1: TXADDR2 <i>UTOPIA master</i>	Output	FCC1: UTOPIA Multi-PHY Master Transmit Address Bit 2 This is master transmit address bit 2.
	FCC1: TXADDR2 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Multi-PHY Slave Transmit Address Bit 2 This is slave transmit address bit 2.
	FCC1: TXCLAV1 <i>UTOPIA multi-PHY master, direct polling</i>	Input	FCC1: UTOPIA Multi-PHY Master Transmit Cell Available 1 Direct Polling Asserted by an external UTOPIA slave PHY to indicate that it can accept one complete ATM cell.
PC6	SI2: L1ST2	Output	Serial Interface 2: Layer 1 Strobe 2 The MSC8101 time-slot assigner supports up to four strobe outputs that can be asserted on a bit or byte basis. The strobe outputs are useful for interfacing to other devices that do not support the multiplexed interface or for enabling/disabling three-state I/O buffers in a multiple-transmitter architecture. These strobes can also generate output wave forms for such applications as stepper-motor control.
	FCC1: $\overline{\text{CD}}$ <i>HDLC serial, HDLC nibble, and transparent</i>	Input	FCC1: Carrier Detect In the standard modem interface signals supported by FCC1 ($\overline{\text{RTS}}$, $\overline{\text{CTS}}$, and $\overline{\text{CD}}$). $\overline{\text{CD}}$ is an input asynchronous with the data.
	FCC1: RXADDR2 <i>UTOPIA master</i>	Output	FCC1: UTOPIA Multi-PHY Master Receive Address Bit 2 This is master receive address bit 2.
	FCC1: RXADDR2 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Slave Receive Address Bit 2 This is slave receive address bit 2.
	FCC1: RXCLAV1 <i>UTOPIA multi-PHY master, direct polling</i>	Input	FCC1: UTOPIA Multi-PHY Master Receive Cell Available 1 Direct Polling Asserted by an external PHY when one complete ATM cell is available for transfer.

Table 1-9. Port C Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PC5	SMC1: SMTXD	Output	SMC1: Transmit Data The SMC interface consists of SMTXD, SMRXD, $\overline{\text{SMSYN}}$, and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that supports three protocols or modes: UART, transparent, or general-circuit interface (GCI).
	SI2: L1ST3	Output	Serial Interface 2: Layer 1 Strobe 3 The MSC8101 time-slot assigner supports up to four strobe outputs that can be asserted on a bit or byte basis. The strobe outputs are useful for interfacing to other devices that do not support the multiplexed interface or for enabling/disabling three-state I/O buffers in a multiple-transmitter architecture. These strobes can also generate output wave forms for such applications as stepper-motor control.
	FCC2: $\overline{\text{CTS}}$ <i>HDLC serial, HDLC nibble, and transparent</i>	Input	FCC2: Clear To Send In the standard modem interface signals supported by FCC2 ($\overline{\text{RTS}}$, $\overline{\text{CTS}}$, and $\overline{\text{CD}}$). $\overline{\text{CTS}}$ is asynchronous with the data.
PC4	SMC1: SMRXD	Input	SMC1: Receive Data The SMC interface consists of SMTXD, SMRXD, $\overline{\text{SMSYN}}$, and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that supports three protocols or modes: UART, transparent, or general-circuit interface (GCI).
	SI2: L1ST4	Output	Serial Interface 2: Layer 1 Strobe 4 The MSC8101 time-slot assigner supports up to four strobe outputs that can be asserted on a bit or byte basis. The strobe outputs are useful for interfacing to other devices that do not support the multiplexed interface or for enabling/disabling three-state I/O buffers in a multiple-transmitter architecture. These strobes can also generate output wave forms for such applications as stepper-motor control.
	FCC2: $\overline{\text{CD}}$ <i>HDLC serial, HDLC nibble, and transparent</i>	Input	FCC2: Carrier Detect In the standard modem interface signals supported by FCC2 ($\overline{\text{RTS}}$, $\overline{\text{CTS}}$ and $\overline{\text{CD}}$). $\overline{\text{CD}}$ is asynchronous with the data.

1.6.4 Port D Signals

Table 1-10. Port D Signals

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PD31	SCC1: RXD	Input	SCC1: Receive Data SCC1 receives serial data from RXD.
	DMA: $\overline{\text{DRACK1}}$	Output	DMA: Data Request Acknowledge 1 DACK1, DREQ1, $\overline{\text{DRACK1}}$, and $\overline{\text{DONE1}}$ belong to the SIU DMA controller. $\overline{\text{DONE1}}$ and $\overline{\text{DRACK1}}$ are signals on the same pin and therefore cannot be used simultaneously. There are two sets of DMA pins associated with the PIO ports.
	DMA: $\overline{\text{DONE1}}$	Input/ Output	DMA: Done 1 DACK1, DREQ1, $\overline{\text{DRACK1}}$, and $\overline{\text{DONE1}}$ belong to the SIU DMA controller. $\overline{\text{DONE1}}$ and $\overline{\text{DRACK1}}$ are signals on the same pin and therefore cannot be used simultaneously. There are two sets of DMA pins associated with the PIO ports.
PD30	SCC1: TXD	Output	SCC1: Transmit Data SCC1 transmits serial data out of TXD.
	DMA: $\overline{\text{DRACK2}}$	Output	DMA: Data Request Acknowledge 2 DACK2, DREQ2, $\overline{\text{DRACK2}}$, and $\overline{\text{DONE2}}$ belong to the SIU DMA controller. $\overline{\text{DONE2}}$ and $\overline{\text{DRACK2}}$ are signals on the same pin and therefore cannot be used simultaneously. There are two sets of DMA pins associated with the PIO ports.
	DMA: $\overline{\text{DONE2}}$	Input/ Output	DMA: Done 2 DACK2, DREQ2, $\overline{\text{DRACK2}}$, and $\overline{\text{DONE2}}$ belong to the SIU DMA controller. $\overline{\text{DONE2}}$ and $\overline{\text{DRACK2}}$ are signals on the same pin and therefore cannot be used simultaneously. There are two sets of DMA pins associated with the PIO ports.
PD29	SCC1: $\overline{\text{RTS}}$, TENA	Output	SCC1: Request to Send, Transmit Enable Typically used in conjunction with $\overline{\text{CD}}$ supported by SCC2. The MSC8101 SCC1 transmitter requests the receiver to send data by asserting $\overline{\text{RTS}}$ low. The request is accepted when $\overline{\text{CTS}}$ is returned low. TENA is the signal used in Ethernet mode.
	FCC1: RXADDR3 UTOPIA master	Output	FCC1: UTOPIA Multi-PHY Master Receive Address Bit 3 This is master receive address bit 3.
	FCC1: RXADDR3 UTOPIA slave	Input	FCC1: UTOPIA Slave Receive Address Bit 3 This is slave receive address bit 3.
	FCC1: RXCLAV2 UTOPIA multi-PHY master, direct polling	Input	FCC1: UTOPIA Multi-PHY Master Receive Cell Available 2 Direct Polling Asserted by an external PHY when one complete ATM cell is available for transfer.

Table 1-10. Port D Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PD19	FCC1: TXADDR4 <i>UTOPIA master</i>	Output	FCC1: Multi-PHY Master Transmit Address Bit 4 Multiplexed Polling This is master transmit address bit 4.
	FCC1: TXADDR4 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Slave Transmit Address Bit 4 This is slave transmit address bit 4.
	FCC1: TXCLAV3 <i>UTOPIA multi-PHY master, direct polling</i>	Input	FCC1: UTOPIA Multi-PHY master Transmit Cell Available 3 Direct Polling Asserted by an external UTOPIA slave PHY to indicate that it can accept one complete ATM cell.
	BRG1O	Output	Baud Rate Generator 1 Output The CPM supports up to 8 BRGs for use internally by the bank-of-clocks selection logic and/or to provide an output to one of the 8 BRG pins. BRG1O can be the internal input to the SIU timers. When CLK5 is selected (see PC27 above), it is the source for BRG1O which is the default input for the SIU timers. See the system interface unit (SIU) chapter in the <i>MSC8101 Reference Manual</i> for additional information. If CLK5 is not enabled, BRG1O uses an internal input. If TMCLK is enabled (see PC26 above), the BRG1O input to the SIU timers is disabled.
	SPI: $\overline{\text{SPISEL}}$	Input	SPI: Select The SPI interface comprises four signals: master out slave in (SPIMOSI), master in slave out (SPIMISO), clock (SPICLK) and select (SPISEL). The SPI can be configured as a slave or master in single- or multiple-master environments. $\overline{\text{SPISEL}}$ is the enable input to the SPI slave. In a multimaster environment, SPISEL (always an input) detects an error when more than one master is operating. SPI masters must output a slave select signal to enable SPI slave devices by using a separate general-purpose I/O signal. Assertion of an SPI SPISEL while it is master causes an error.
PD18	FCC1: RXADDR4 <i>UTOPIA master</i>	Output	FCC1: UTOPIA Master Receive Address Bit 4 This is master receive address bit 4.
	FCC1: RXADDR4 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Slave Receive Address Bit 4 This is slave receive address bit 4.
	FCC1: RXCLAV3 <i>UTOPIA multi-PHY master, direct polling</i>	Input	FCC1: UTOPIA Multi-PHY Master Receive Cell Available 3 Direct Polling Asserted by an external PHY when one complete ATM cell is available for transfer.
	SPI: SPICLK	Input/ Output	SPI: Clock The SPI interface comprises four signals: master out slave in (SPIMOSI), master in slave out (SPIMISO), clock (SPICLK) and select (SPISEL). The SPI can be configured as a slave or master in single- or multiple-master environments. SPICLK is a gated clock, active only during data transfers. Four combinations of SPICLK phase and polarity can be configured. When the SPI is a master, SPICLK is the clock output signal that shifts received data in from SPIMISO and transmitted data out to SPIMOSI.

Table 1-10. Port D Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PD17	BRG2O	Output	Baud Rate Generator 2 Output The CPM supports up to 8 BRGs for use internally to the MSC8101 and/or to provide an output to one of the 8 BRG pins.
	FCC1: RXPRTY <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Parity This is the odd parity bit for RXD[0–7].
	SPI: SPIMOSI	Input/ Output	SPI: Master Output Slave Input The SPI interface comprises our signals: master out slave in (SPIMOSI), master in slave out (SPIMISO), clock (SPICLK) and select (SPISEL). The SPI can be configured as a slave or master in single- or multiple-master environments. When the SPI is a slave, SPICLK is the clock input that shifts received data in from SPIMOSI and transmitted data out through SPIMISO.
PD16	FCC1: TXPRTY <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Parity This is the odd parity bit for TXD[0–7].
	SPI: SPIMISO	Input/ Output	SPI: Master Input Slave Output The SPI interface comprises four signals: master out slave in (SPIMOSI), master in slave out (SPIMISO), clock (SPICLK), and select (SPISEL). The SPI can be configured as a slave or master in single- or multiple-master environments. When the SPI is a slave, SPICLK is the clock input that shifts received data in from SPIMOSI and transmitted data out through SPIMISO.
PD7	SMC1: $\overline{\text{SMSYN}}$	Input	SMC1: Serial Management Synchronization The SMC interface consists of SMTXD, SMRXD, SMSYN and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that support three protocols or modes: UART, transparent or general-circuit interface (GCI).
	FCC1: TXADDR3 <i>UTOPIA master</i>	Output	FCC1: UTOPIA Master Transmit Address Bit 3 This is master transmit address bit 3.
	FCC1: TXADDR3 <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Slave Transmit Address Bit 3 This is slave transmit address bit 3.
	FCC1: TXCLAV2 <i>UTOPIA multi-PHY master, direct polling</i>	Input	FCC1: UTOPIA Multi-PHY Master Transmit Cell Available 2 Direct Polling Asserted by an external UTOPIA slave PHY to indicate that it can accept one complete ATM cell.

1.7 JTAG Test Access Port Signals

The MSC8101 supports the standard set of Test Access Port (TAP) signals defined by IEEE 1149.1 Standard Test Access Port and Boundary-Scan Architecture specification and described in **Table 1-11**.

Table 1-11. JTAG Test Access Port Signals

Signal Name	Type	Signal Description
TCK	Input	Test Clock A test clock signal for synchronizing JTAG test logic.
TDI	Input	Test Data Input A test data serial signal for test instructions and data. TDI is sampled on the rising edge of TCK and has an internal pull-up resistor.
TDO	Output	Test Data Output A test data serial signal for test instructions and data. TDO can be tri-stated. The signal is actively driven in the shift-IR and shift-DR controller states and changes on the falling edge of TCK.
TMS	Input	Test Mode Select Sequences the test controller's state machine, is sampled on the rising edge of TCK, and has an internal pull-up resistor.
$\overline{\text{TRST}}$	Input	Test Reset Asynchronously initializes the test controller, has an internal pull-up resistor, and must be asserted after power up.

1.8 Reserved Signals

Table 1-12. Reserved Signals

Signal Name	Type	Signal Description
TEST	Input	Test Used for manufacturing testing. You must connect this input to GND.
THERM[1-2]	—	Leave disconnected.
SPARE1, 5	—	Spare Pins Leave disconnected for backward compatibility with future revisions of this device.

Physical and Electrical Specifications 2

This document contains detailed information on environmental limits, power considerations, DC/AC electrical characteristics, and AC timing specifications for the MSC8101 communications processor, mask set 2K87M. For additional information, see the *MSC8101 Reference Manual*.

2.1 Absolute Maximum Ratings

CAUTION

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, normal precautions should be taken to avoid exceeding maximum voltage ratings. Reliability is enhanced if unused inputs are tied to an appropriate logic voltage level (for example, either GND or V_{CC}).

In calculating timing requirements, adding a maximum value of one specification to a minimum value of another specification does not yield a reasonable sum. A maximum specification is calculated using a worst case variation of process parameter values in one direction. The minimum specification is calculated using the worst case for the same parameters in the opposite direction. Therefore, a “maximum” value for a specification never occurs in the same device with a “minimum” value for another specification; adding a maximum to a minimum represents a condition that can never exist. **Table 2-1** describes the maximum electrical ratings for the MSC8101.

Table 2-1. Absolute Maximum Ratings²

Rating	Symbol	Value	Unit
Core supply voltage ³	V _{DD}	-0.2 to 1.7	V
PLL supply voltage ³	V _{CCSYN}	-0.2 to 1.7	V
I/O supply voltage ³	V _{DDH}	-0.2 to 3.6	V
Input voltage ³	V _{IN}	(GND - 0.2) to 3.6	V
Maximum operating temperature range ⁴	T _J	-40 to 120	°C
Storage temperature range	T _{STG}	-55 to +150	°C
Notes: <ol style="list-style-type: none">Functional operating conditions are given in Table 2-2.Absolute maximum ratings are stress ratings only, and functional operation at the maximum is not guaranteed. Stress beyond the listed limits may affect device reliability or cause permanent damage.The input voltage must not exceed the I/O supply V_{DDH} by more than 2.5 V at any time, including during power-on reset. In turn, V_{DDH} can exceed V_{DD}/V_{CCSYN} by more than 3.3 V during power-on reset, but for no more than 100 ms. V_{DDH} should not exceed V_{DD}/V_{CCSYN} by more than 2.1 V during normal operation. V_{DD}/V_{CCSYN} must not exceed V_{DDH} by more than 0.4 V at any time, including during power-on reset. See Section 4.2, Electrical Design Considerations, on page 4-1 for more information.Section 4.1, Thermal Design Considerations, on page 4-1 includes a formula for computing the chip junction temperature (T_J).			

2.2 Recommended Operating Conditions

Table 2-2 lists recommended operating conditions. Proper device operation outside of these conditions is not guaranteed.

Table 2-2. Recommended Operating Conditions

Rating	Symbol	Value	Unit
SC140 core supply voltage	V_{DD}	250/275 MHz: 1.5 to 1.7 300 MHz: 1.55 to 1.7	V V
PLL supply voltage	V_{CCSYN}	250/275 MHz: 1.5 to 1.7 300 MHz: 1.55 to 1.7	V V
I/O supply voltage	V_{DDH}	3.135 to 3.465	V
Input voltage	V_{IN}	-0.2 to $V_{DDH} + 0.2$	V
Operating temperature range	T_J	250/275 MHz: -40 to 105 300 MHz: -40 to 75	°C °C

2.3 Thermal Characteristics

Table 2-3 describes thermal characteristics of the MSC8101.

Table 2-3. Thermal Characteristics

Characteristic	Symbol	Lidded FC-PBGA 17 × 17 mm		Unit
		Natural Convection	200 ft/min (1 m/s) airflow	
Junction-to-ambient, single-layer board ^{1, 2}	$R_{\theta JA}$ or θ_{JA}	50	37	°C/W
Junction-to-ambient, four-layer board ^{1, 3}	$R_{\theta JA}$ or θ_{JA}	22	18	°C/W
Junction-to-board ³	$R_{\theta JB}$ or θ_{JB}	15		°C/W
Junction-to-case ⁴	$R_{\theta JC}$ or θ_{JC}	TBD		°C/W
Notes: <ol style="list-style-type: none"> Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance. Per SEMI G38-87 and EIA/JESD51-2 with the single layer board horizontal. Per JEDEC JESD51-6 with the board (JESD51-9) horizontal. Thermal resistance between the die and the printed circuit board per JEDEC JESD 51-8. Board temperature is measured on the top surface of the board near the package. Thermal resistance between the die and the case top surface without thermal grease. TBD = to be determined. If a thin (less than 50 micron) thermal grease interface is established to a heat sink from the lid, the junction to sink thermal resistance is about 0.7 °C/W. 				

See Section 4.1, *Thermal Design Considerations*, on page 4-1 for details on these characteristics.

2.4 DC Electrical Characteristics

This section describes the DC electrical characteristics for the MSC8101. The measurements in **Table 2-4** assume the following system conditions:

- $T_J = 0 - 100\text{ }^\circ\text{C}$
- $V_{DD} = 1.6\text{ V} \pm 5\% V_{DC}$
- $V_{DDH} = 3.3\text{ V} \pm 5\% V_{DC}$
- $GND = 0\text{ V}_{DC}$

Note: The leakage current is measured for nominal V_{DDH} and V_{DD} or both V_{DDH} and V_{DD} must vary in the same direction (for example, both V_{DDH} and V_{DD} vary by ± 5 percent).

Table 2-4. DC Electrical Characteristics

Characteristic	Symbol	Min	Max	Unit
Input high voltage, all inputs except CLKIN	V_{IH}	2.0	3.465	V
Input low voltage	V_{IL}	GND	0.8	V
CLKIN input high voltage	V_{IHC}	2.5	3.465	V
CLKIN input low voltage ¹	V_{ILC}	GND	0.8	V
Input leakage current, $V_{IN} = V_{DDH}$	I_{IN}	—	10	μA
Tri-state (high impedance off state) leakage current, $V_{IN} = V_{DDH}$	I_{OZ}	—	10	μA
Signal low input current ² , $V_{IL} = 0.4\text{ V}$	I_L	—	-4.0	mA
Signal high input current ² , $V_{IH} = 2.0\text{ V}$	I_H	—	4.0	mA
Output high voltage, $I_{OH} = -2\text{ mA}$, except open drain pins	V_{OH}	2.4	—	V
Output low voltage, $I_{OL} = 3.2\text{ mA}$	V_{OL}	—	0.4	V
Notes:				
1. The optimum CLKIN duty cycle is obtained when: $V_{ILC} = V_{DDH} - V_{IHC}$.				
2. Not tested. Guaranteed by design.				

Table 2-5. Typical Power Dissipation

Characteristic	Symbol	Typical	Unit
Core power dissipation at 300 MHz	P_{CORE}	450	mW
CPM power dissipation at 200 MHz	P_{CPM}	320	mW
SIU power dissipation at 100 MHz	P_{SIU}	80	mW
Core leakage power	P_{LCO}	3	mW
CPM leakage power	P_{LCP}	6	mW
SIU leakage power	P_{LSI}	2	mW

2.5 Clock Configuration

The following sections provide a general description of clock configuration.

2.5.1 Valid Clock Modes

Table 2-6 shows the maximum frequency values for each rated core frequency (250, 275, or 300 MHz). The user must ensure that maximum frequency values are not exceeded.

Table 2-6. Maximum Frequencies

Characteristic	Maximum Frequency in MHz		
	250	275	300
Core Frequency	250	275	300
CPM Frequency (CPMCLK)	166.67	183.33	200
Bus Frequency (BCLK)	83.33	91.67	100
Serial Communication Controller Clock Frequency (SCLK)	83.33	91.67	100
Baud Rate Generator Clock Frequency (BRGCLK)	83.33	91.67	100
External Clock Output Frequency (CLKOUT)	83.33	91.67	100

Six bit values map the MSC8101 clocks to one of the valid configuration mode options. Each option determines the CLKIN, SC140, system bus, SCC clock, CPM, and CLKOUT frequencies. The six bit values are derived from three dedicated input pins (MODCK[1–3]) and three bits from the hard reset configuration word (MODCK_H). To configure the SPLL pre-division factor, SPLL multiplication factor, and the frequencies for the SC140, SCC clocks, CPM parallel I/O ports, and system buses, the MODCK[1–3] pins are sampled and combined with the MODCK_H values when the internal power-on reset (internal $\overline{\text{PORESET}}$) is deasserted. Clock configuration changes only when the internal $\overline{\text{PORESET}}$ signal is deasserted. The following factors are configured:

- SPLL pre-division factor (SPLL PDF)
- SPLL multiplication factor (SPLL MF)
- Bus post-division factor (Bus DF)
- CPM division factor (CPM DF)
- Core division factor (Core DF)
- CPLL pre-division factor (CPLL PDF)
- CPLL multiplication factor (CPLL MF)

The SCC division factor (SCC DF) is fixed at 4. The BRG division factor (BRG DF) is configured through the System Clock Control Register (SCCR) and can be 4, 16 (default after reset), 64, or 256.

Note: Refer to *Clock Mode Selection for MSC8101 and MSC8103 Mask Set 2K87M* (AN2306) for details on clock configuration.

2.5.2 Clocks Programming Model

This section describes the clock registers in detail. The registers discussed are as follows:

- System Clock Control Register (SCCR)
- System Clock Mode Register (SCMR)

2.5.2.1 System Clock Control Register

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Type	—															
Reset	Reserved															
Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Type	—											CLKODIS	—		DFBRG	
Reset	Reserved											R/W	Reserved		R/W	
Reset	—											0	—		0	1

Figure 2-1. System Clock Control Register (SCCR)—0x10C80

SCCR is memory-mapped into the SIU register map of the MSC8101.

Table 2-7. SCCR Bit Descriptions

Name Bit No.	Defaults		Description	Settings
	PORESET	Hard Reset		
— 0–26	—	—	Reserved. Write to 0 for future compatibility.	
CLKODIS 27	0	Unaffected	CLKOUT Disable Disables the CLKOUT signal. The value of CLKOUT when disabled is indeterminate (can be 1 or 0).	0 CLKOUT enabled (default) 1 CLKOUT disabled
— 28–29	—	—	Reserved. Write to 0 for future compatibility.	
DFBRG 30–31	01	Unaffected	Division Factor for the BRG Clock Defines the BRGCLK frequency. Changing this value does not result in a loss of lock condition.	00 Divide by 4 01 Divide by 16 (default value) 10 Divide by 64 11 Divide by 256

2.5.2.2 System Clock Mode Register

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Type	COREPDF				COREMF				BUSDF				CPMDF			
Reset	—															
Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Type	SPLLPDF				SPLLMF				—	DLLDIS	—		COREDF			
Reset	—															

Figure 2-2. System Clock Mode Register (SCMR)—0x10C88

SCMR is a read-only register that is updated during power-on reset (PORESET) and provides the mode control signals to the PLLs, DLL, and clock logic. This register reflects the currently defined configuration settings. For details of the available setting options, see *AN2306/D*.

Table 2-8. SCMR Field Descriptions

Name Bit No.	Defaults		Description	Settings
	PORESET	Hard Reset		
COREPDF 0–3	Configuration Pins	Unaffected	Core PLL Pre-Division Factor	0000 CPLL PDF = 1 0001 CPLL PDF = 2 0010 CPLL PDF = 3 0011 CPLL PDF = 4 All other combinations not used.
COREMF 4–7	Configuration Pins	Unaffected	Core Multiplication Factor	0101 CPLL MF = 10 0110 CPLL MF = 12 0111 CPLL MF = 14 All other combinations not used.
BUSDF 8–11	Configuration Pins	Unaffected	60x-compatible Bus Division Factor	0001 Bus DF = 2 0010 Bus DF = 3 0011 Bus DF = 4 0100 Bus DF = 5 0101 Bus DF = 6 All other combinations not used.
CPMDF 12–15	Configuration Pins	Unaffected	CPM Division Factor	0000 CPM DF = 1 0001 CPM DF = 2 0010 CPM DF = 3 All other combinations not used.
SPLLPDF 16–19	Configuration Pins	Unaffected	SPLL Pre-Division Factor	0000 SPLL PDF = 1 0001 SPLL PDF = 2 0010 SPLL PDF = 3 0011 SPLL PDF = 4 0100 SPLL PDF = 5 0101 SPLL PDF = 6 All other combinations not used
SPLLMF 20–23	Configuration Pins	Unaffected	SPLL Multiplication Factor	0101 SPLL MF = 10 0110 SPLL MF = 12 0111 SPLL MF = 14 1000 SPLL MF = 16 1001 SPLL MF = 18 1010 SPLL MF = 20 1011 SPLL MF = 22 1100 SPLL MF = 24 1101 SPLL MF = 26 1110 SPLL MF = 28 1111 SPLL MF = 30 All other combinations not used
— 24	—	—	Reserved	
DLLDIS 25	Configuration Pins	Unaffected	DLL Disable	0 DLL operation is enabled 1 DLL is disabled
— 26–27	—	—	Reserved	
CORED 28–31	Configuration Pins	Unaffected	Core Division Factor	0000 CORE DF = 1 0001 CORE DF = 2 0010 CORE DF = 3 0011 CORE DF = 4 0100 CORE DF = 5 0101 CORE DF = 6 All other combinations not used.

2.6 AC Timings

The following sections include illustrations and tables of clock diagrams, signals, and parallel I/O outputs and inputs. AC timings are based on a 50 pF load, except where noted otherwise, and 50 Ω transmission line.

2.6.1 Output Buffer Impedances

Table 2-9. Output Buffer Impedances

Output Buffers	Typical Impedance (Ω)
System Bus	35
Memory Controller	35
Parallel I/O	55
Note: These are typical values at 65°C. The impedance may vary by $\pm 25\%$ depending on device process and operating temperature.	

2.6.2 Clocking and Timing Characteristics

Table 2-10. System Clock Parameters

Characteristic	Minimum	Maximum	Unit
Phase Jitter between BCLK and DLLIN	—	0.5	ns
CLKIN frequency ^{1,2}	18	75	MHz
CLKIN slope	—	5	ns
DLLIN slope	—	2	ns
CLKOUT frequency jitter	—	(0.01/CLKOUT) + CLKIN jitter	ns
Delay between CLKOUT and DLLIN	—	5	ns
Notes:			
1. Low CLKIN frequency causes poor PLL performance. Choose a CLKIN frequency high enough to keep the frequency after the predivider (SPLLMFCLK) higher than 18 MHz.			
2. CLKIN should have a 50% \pm 5% duty cycle.			

Table 2-11. Clock Ranges

Clock	Symbol	Maximum Rated Core Frequency

2.6.3 Reset Timing

The MSC8101 has several inputs to the reset logic:

- Power-on reset ($\overline{\text{PORESET}}$)
- External hard reset ($\overline{\text{HRESET}}$)
- External soft reset ($\overline{\text{SRESET}}$)

Asserting an external $\overline{\text{PORESET}}$ causes concurrent assertion of an internal $\overline{\text{PORESET}}$ signal, $\overline{\text{HRESET}}$, and $\overline{\text{SRESET}}$. When the external $\overline{\text{PORESET}}$ signal is deasserted, the MSC8101 samples several configuration pins:

- $\overline{\text{RSTCONF}}$ —determines whether the MSC8101 is a master (0) or slave (1) device
- DBREQ—determines whether to operate in normal mode (0) or invoke the SC140 debug mode (1)
- HPE—disable (0) or enable (1) the host port (HDI16)
- BTM[0–1]—boot from external memory (00) or the HDI16 (01)

All these reset sources are fed into the reset controller, which takes different actions depending on the source of the reset. The reset status register indicates the last sources to cause a reset. **Table 2-12** describes reset causes.

Table 2-12. Reset Causes

Name	Direction	Description
Power-on reset ($\overline{\text{PORESET}}$)	Input	$\overline{\text{PORESET}}$ initiates the power-on reset flow that resets all the MSC8101s and configures various attributes of the MSC8101, including its clock mode.
Hard reset ($\overline{\text{HRESET}}$)	Input/Output	The MSC8101 can detect an external assertion of $\overline{\text{HRESET}}$ only if it occurs while the MSC8101 is not asserting reset. During $\overline{\text{HRESET}}$, $\overline{\text{SRESET}}$ is asserted. $\overline{\text{HRESET}}$ is an open-drain pin.
Soft reset ($\overline{\text{SRESET}}$)	Input/Output	The MSC8101 can detect an external assertion of $\overline{\text{SRESET}}$ only if it occurs while the MSC8101 is not asserting reset. $\overline{\text{SRESET}}$ is an open-drain pin.

2.6.3.1 Reset Operation

The reset control logic determines the cause of a reset, synchronizes it if necessary, and resets the appropriate logic modules. The memory controller, system protection logic, interrupt controller, and parallel I/O pins are initialized only on hard reset. Soft reset initializes the internal logic while maintaining the system configuration. The MSC8101 has three mechanisms for reset configuration: host reset configuration, hardware reset configuration, and reduced reset configuration.

2.6.3.2 Power-On Reset Flow

Asserting the $\overline{\text{PORESET}}$ external pin initiates the power-on reset flow. $\overline{\text{PORESET}}$ should be asserted externally for at least 16 input clock cycles after external power to the MSC8101 reaches at least $2/3 V_{CC}$. As **Table 2-13** shows, the MSC8101 has five configuration pins, four of which are multiplexed with the SC140 EONCE Event (EE[0–1], EE[4–5]) pins and the fifth of which is the $\overline{\text{RSTCONF}}$ pin. These pins are sampled at the rising edge of $\overline{\text{PORESET}}$. In addition to these configuration pins, three (MODCK[1–3]) pins are sampled by the MSC8101. The signals on these pins and the MODCK_H value in the Hard Reset Configuration Word determine the PLL locking mode, by defining the ratio between the DSP clock, the bus clocks, and the CPM clock frequencies.

Table 2-13. External Configuration Signals

Pin	Description	Settings
RSTCONF	Reset Configuration Input line sampled by the MSC8101 at the rising edge of $\overline{\text{PORESET}}$.	0 Reset Configuration Master. 1 Reset Configuration Slave.
DBREQ/ EE0	EONCE Event Bit 0 Input line sampled after SC140 core PLL locks. Holding EE0 high when $\overline{\text{PORESET}}$ is deasserted puts the SC140 into Debug mode.	0 SC140 starts the normal processing mode after reset. 1 SC140 enters Debug mode immediately after reset.
HPE/EE1	Host Port Enable Input line sampled at the rising edge of $\overline{\text{PORESET}}$. If asserted, the Host port is enabled, the system data bus is 32-bit wide, and the Host <i>must</i> program the reset configuration word.	0 Host port disabled (hardware reset configuration enabled). 1 Host port enabled.
BTM[0–1]/ EE[4–5]	Boot Mode Input lines sampled at the rising edge of $\overline{\text{PORESET}}$, which determine the MSC8101 Boot mode.	00 MSC8101 boots from external memory. 01 MSC8101 boots from HDI16. 10 Reserved. 11 Reserved.

Table 2-14. Reset Timing

No.	Characteristics	Expression	Min	Max	Unit
1	Required external $\overline{\text{PORESET}}$ duration minimum • CLKIN = 18 MHz • CLKIN = 75 MHz	$16 / \text{CLKIN}$	888.8 213.3	— —	ns ns
2	Delay from deassertion of external $\overline{\text{PORESET}}$ to deassertion of internal $\overline{\text{PORESET}}$ • CLKIN = 18 MHz • CLKIN = 75 MHz	$1024 / \text{CLKIN}$	56.89 13.65		μs μs
3	Delay from deassertion of internal $\overline{\text{PORESET}}$ to SPLL lock • SPLL MFCLK = 18 MHz • SPLL MFCLK = 25 MHz	$800 / \text{SPLL MFCLK}$	44.4 32.0		μs μs
4	Delay from SPLL lock to DLL lock • DLL enabled — BCLK = 18 MHz — BCLK = 75 MHz • DLL disabled	$3073 / \text{BCLK}$ —	170.72 40.97 0.0		μs μs ns
5	Delay from SPLL lock to $\overline{\text{HRESET}}$ deassertion • DLL enabled — BCLK = 18 MHz — BCLK = 75 MHz • DLL disabled — BCLK = 18 MHz — BCLK = 75 MHz	$3585 / \text{BCLK}$ $512 / \text{BCLK}$	199.17 47.5 28.4 6.83		μs μs μs μs

Table 2-14. Reset Timing (Continued)

No.	Characteristics	Expression	Min	Max	Unit
6	Delay from SPLL lock to $\overline{\text{SRESET}}$ deassertion	3588 / BLCK	199.33	47.84	μs
			47.84		μs
		515 / BLCK	28.61	6.87	μs
			6.87		μs

Note: Value given for lowest possible CLKIN frequency 18 MHz to ensure proper initialization of reset sequence.

2.6.3.3 Host Reset Configuration

Host reset configuration allows the host to program the reset configuration word via the Host port after $\overline{\text{PORESET}}$ is deasserted, as described in the *MSC8101 Reference Manual*. The MSC8101 samples the signals described in **Table 2-13** on the rising edge of $\overline{\text{PORESET}}$ when the signal is deasserted.

If HPE is sampled high, the host port is enabled. In this mode the $\overline{\text{RSTCONF}}$ pin *must* be pulled up. The device extends the internal $\overline{\text{PORESET}}$ until the host programs the reset configuration word register. The host must write four 8-bit half-words to the Host Reset Configuration Register address to program the reset configuration word, which is 32 bits wide. For more information, see the *MSC8101 Reference Manual*. The reset configuration word is programmed before the internal PLL and DLL in the MSC8101 are locked. The host must program it after the rising edge of the $\overline{\text{PORESET}}$ input. In this mode, the host must have its own clock that does not depend on the MSC8101 clock. After the PLL and DLL are locked, $\overline{\text{HRESET}}$ remains asserted for another 512 bus clocks and is then released. The $\overline{\text{SRESET}}$ is released three bus clocks later (see **Figure 2-3**).

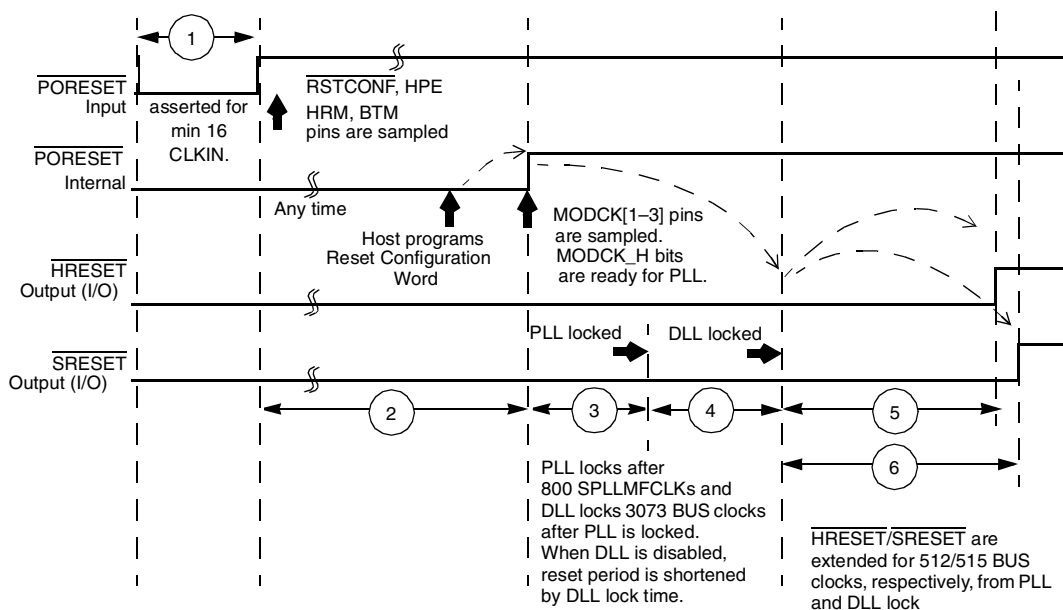

Figure 2-3. Host Reset Configuration Timing

2.6.3.4 Hardware Reset Configuration

Hardware reset configuration is enabled if HPE is sampled low at the rising edge of $\overline{\text{PORESET}}$. The value driven on $\overline{\text{RSTCONF}}$ while $\overline{\text{PORESET}}$ changes from assertion to deassertion determines the MSC8101 configuration. If $\overline{\text{RSTCONF}}$ is deasserted (driven high) while $\overline{\text{PORESET}}$ changes, the MSC8101 acts as a configuration slave. If $\overline{\text{RSTCONF}}$ is asserted (driven low) while $\overline{\text{PORESET}}$ changes, the MSC8101 acts as a configuration master. **Section 2.6.3.4, Hardware Reset Configuration**, explains the configuration sequence and the terms “configuration master” and “configuration slave.”

Directly after the deassertion of $\overline{\text{PORESET}}$ and choice of the reset operation mode as configuration master or configuration slave, the MSC8101 starts the configuration process. The MSC8101 asserts $\overline{\text{HRESET}}$ and $\overline{\text{SRESET}}$ throughout the power-on reset process, including configuration. Configuration takes 1024 CLOCKIN cycles, after which MODCK[1–3] are sampled to determine the MSC8101’s working mode.

Next, the MSC8101 halts until the SPLL locks. The SPLL locks according to MODCK[1–3], which are sampled, and to MODCK_H taken from the Reset Configuration Word. SPLL locking time is 800 reference clocks, which is the clock at the output of the SPLL Pre-divider. After the SPLL is locked, all the clocks to the MSC8101 are enabled. If the DLLDIS bit in the reset configuration word is reset, the DLL starts the locking process after the SPLL is locked. During PLL and DLL locking, $\overline{\text{HRESET}}$ and $\overline{\text{SRESET}}$ are asserted. $\overline{\text{HRESET}}$ remains asserted for another 512 BUS clocks and is then released. The $\overline{\text{SRESET}}$ is released three bus clocks later. If the DLLDIS bit in the reset configuration word is set, the DLL is bypassed and there is no locking process, thus saving the DLL locking time. **Figure 2-4** shows the power-on reset flow.

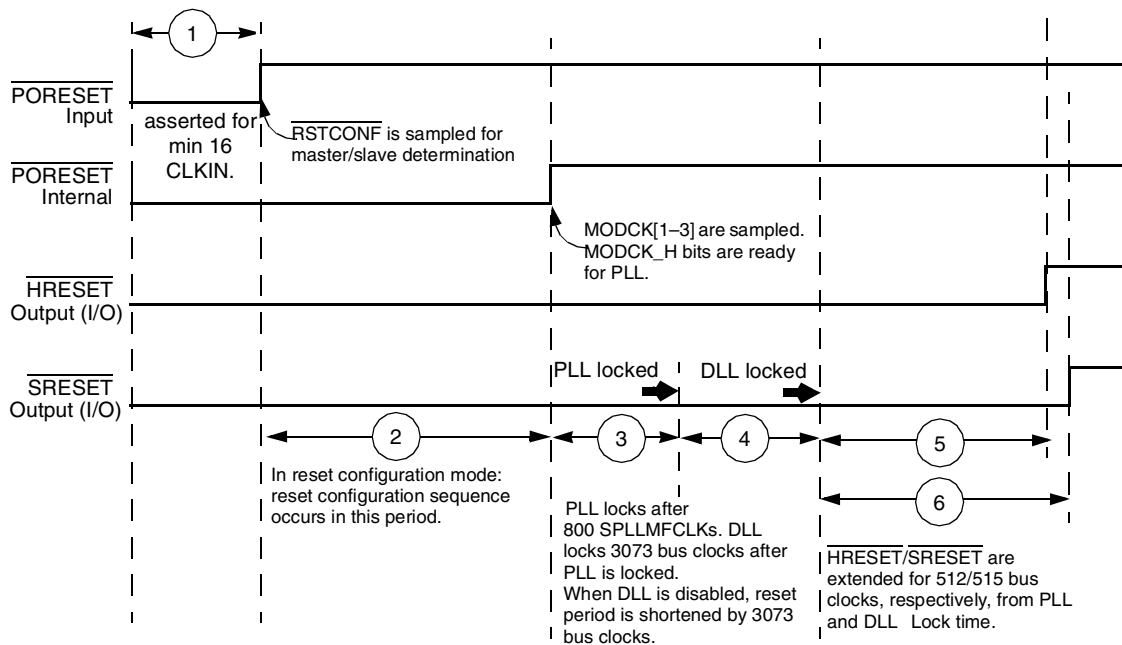

Figure 2-4. Hardware Reset Configuration Timing

2.6.4 System Bus Access Timing

2.6.4.1 Core Data Transfers

Generally, all MSC8101 bus and system output signals are driven from the rising edge of the reference clock (REFCLK), which is DLLIN. Memory controller signals, however, trigger on four points within a DLLIN cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge of DLLIN (and T3 at the falling edge), but the spacing of T2 and T4 depends on the PLL clock ratio selected, as **Table 2-15** shows.

Table 2-15. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of DLLIN)		
	T2	T3	T4
1:2, 1:3, 1:4, 1:5, 1:6	1/4 DLLIN	1/2 DLLIN	3/4 DLLIN
1:2.5	3/10 DLLIN	1/2 DLLIN	8/10 DLLIN
1:3.5	4/14 DLLIN	1/2 DLLIN	11/14 DLLIN

Figure 2-5 is a graphical representation of **Table 2-15**.

Figure 2-5. Internal Tick Spacing for Memory Controller Signals

Note: The UPM machine and GPCM machine outputs change on the internal tick determined by the memory controller programming; the AC specifications are relative to the internal tick. SDRAM machine outputs change only on the DLLIN rising edge.

Table 2-16. AC Timing for SIU Inputs

No.	Characteristic	Value ²	Units

36	Delay from the 50% level of the DLLIN rising edge for all other signals	1.0	4.5	6.0	ns
Notes: <ol style="list-style-type: none"> The maximum bus frequency depends on the mode: <ul style="list-style-type: none"> In 60x-compatible mode connected to another MSC8101 device, the frequency is determined by adding the input and output longest timing values, which results in a frequency of 75 MHz for 30 pF output capacitance. In multi-master mode when connected to another MSC8101 device, the frequency is determined by adding the input and output longest timing values, which results in a frequency of 75 MHz for 30 pF output capacitance. Certain bus modes, such as non-extra cycle (EXDD = 1), non-pipelined, and ECC/Parity modes, result in slower bus frequencies. In single-master mode, the frequency depends on the timing of the devices connected to the MSC8101. Output specifications are measured from the 50% level of the rising edge of DLLIN to the 50% level of the signal. Timings are measured at the pin. 					

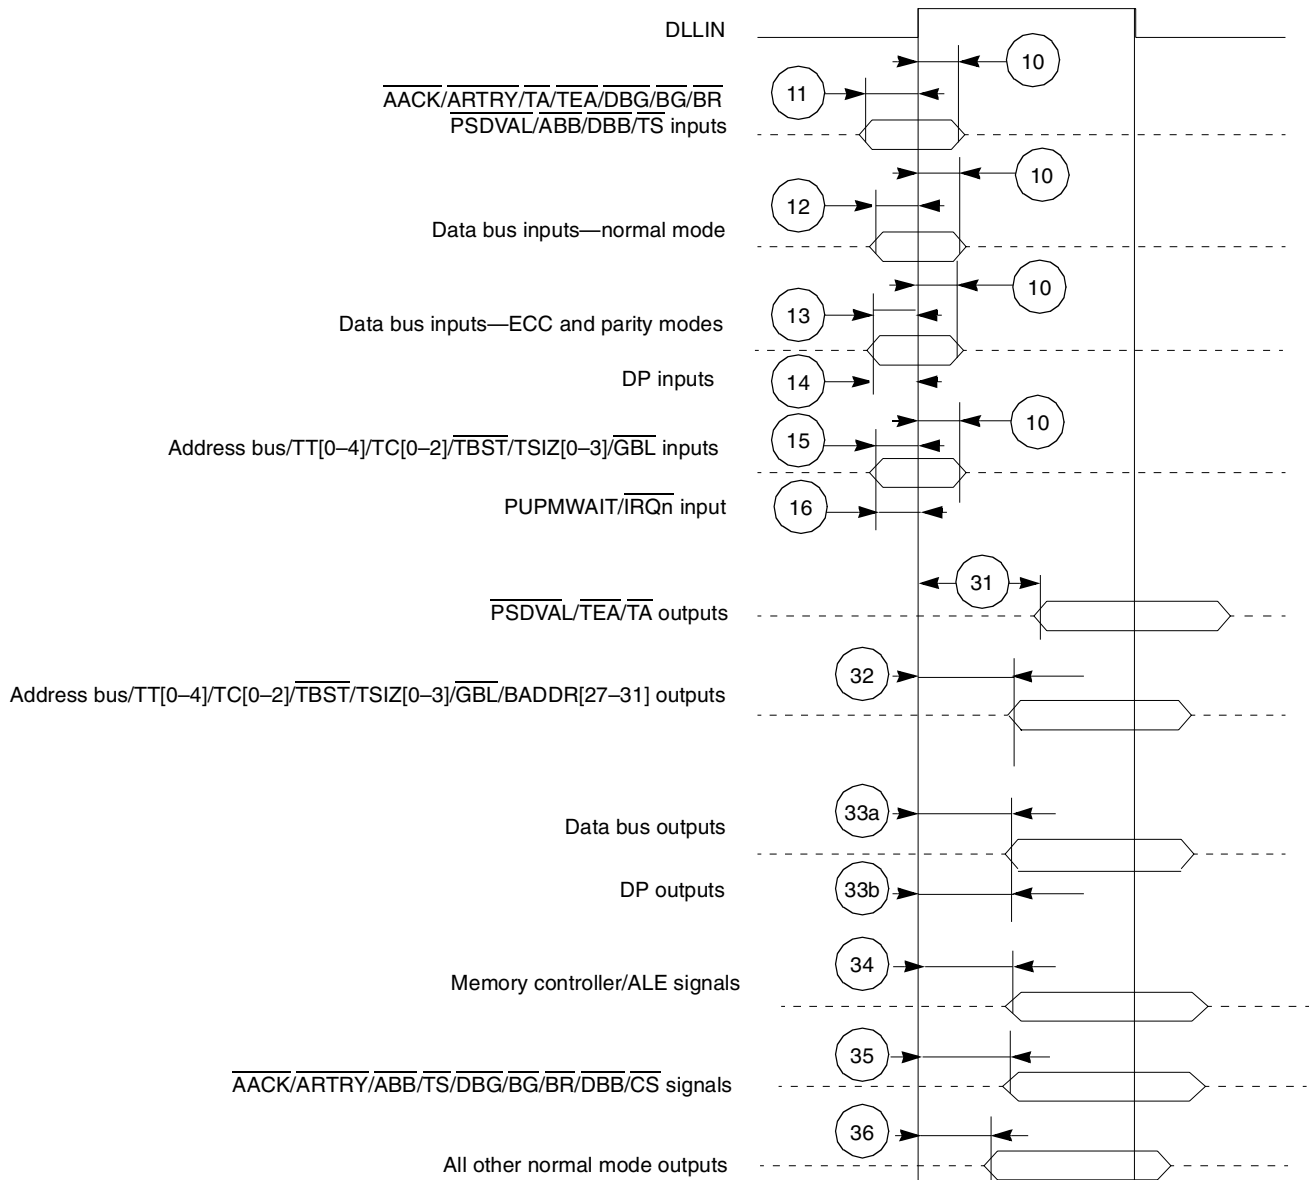

Figure 2-6. Bus Signal Timing

2.6.4.2 DMA Data Transfers

Table 2-18 describes the DMA signal timing.

Table 2-18. DMA Signals

Number	Characteristic	Minimum	Maximum	Units
72	DREQ set-up time before DLLIN falling edge	6	—	ns
73	DREQ hold time after DLLIN falling edge	0.5	—	ns
74	$\overline{\text{DONE}}$ set-up time before DLLIN rising edge	9	—	ns
75	$\overline{\text{DONE}}$ hold time after DLLIN rising edge	0.5	—	ns
76	$\overline{\text{DACK}}/\overline{\text{DRACK}}/\overline{\text{DONE}}$ delay after DLLIN rising edge	0.5	9	ns

The DREQ signal is synchronized with the falling edge of DLLIN. $\overline{\text{DONE}}$ timing is relative to the rising edge of DLLIN. To achieve fast response, a synchronized peripheral should assert DREQ according to the timings in Table 2-18. Figure 2-7 shows synchronous peripheral interaction.

64	Maximum delay from DMA HACK (OAD=0) or Read/Write data strobe(OAD=1) assertion to HREQ deassertion	$(3.5 \times T_C) + 5.0$	Note 11	ns
Notes:	<ol style="list-style-type: none"> $T_C = 1 / \text{DSPCLK}$. At 300 MHz, $T_C = 3.3$ ns In the timing diagrams below, the controls pins are drawn as active low. The pin polarity is programmable. $V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$; $T_J = -40^\circ\text{C}$ to $+100^\circ\text{C}$, $C_L = 50$ pF The read data strobe is $\overline{\text{HRD}}/\overline{\text{HRD}}$ in the dual data strobe mode and $\overline{\text{HDS}}/\overline{\text{HDS}}$ in the single data strobe mode. In 64-bit mode, The “last data register” is the register at address \$7, which is the last location to be read or written in data transfers. This is RX0/TX0 in the little endian mode (HBE = 0), or RX3/TX3 in the big endian mode (HBE = 1). This timing is applicable only if a read from the “last data register” is followed by a read from the RXL, RXM, or RXH registers without first polling RXDF or HREQ bits, or waiting for the assertion of the HREQ/HREQ signal. This timing is applicable only if two consecutive reads from one of these registers are executed. The write data strobe is $\overline{\text{HWR}}$ in the dual data strobe mode and $\overline{\text{HDS}}$ in the single data strobe mode. The data strobe is host read ($\overline{\text{HRD}}/\overline{\text{HRD}}$) or host write ($\overline{\text{HWR}}/\overline{\text{HWR}}$) in the dual data strobe mode and host data strobe ($\overline{\text{HDS}}/\overline{\text{HDS}}$) in the single data strobe mode. The host request is $\overline{\text{HREQ}}/\overline{\text{HREQ}}$ in the single host request mode and $\overline{\text{HRRQ}}/\overline{\text{HRRQ}}$ and $\overline{\text{HTRQ}}/\overline{\text{HTRQ}}$ in the double host request mode. $\overline{\text{HRRQ}}/\overline{\text{HRRQ}}$ is deasserted only when HORTX fifo is empty, $\overline{\text{HTRQ}}/\overline{\text{HTRQ}}$ is deasserted only if HORTX fifo is full (treat as level Host Request). Compute the value using the expression.

No.	Characteristic	Min	Max	Unit
41	FCC output delay after low-to-high clock transition	0	6	ns
	a. internal clock (BRGxO) b. external clock (serial input clock)	2	18	ns
38	SCC/SMC/SPI/I ² C output delay after low-to-high clock transition	0	20	ns
	a. internal clock (BRGxO) b. external clock (serial input clock)	0	30	ns
40	TDM output delay after low-to-high serial clock transition	5	15	ns
42	PIO/TIMER/DMA output delay after low-to-high serial clock transition	1	14	ns

Note: FCC, SCC, SMC, SPI, I²C are non-multiplexed serial interface signals.

Figure 2-17. SCC/SMC/SPI/I²C External Clock Diagram

Figure 2-18. TDM Signal Diagram

Figure 2-19. PIO, Timer, and DMA Signal Diagram

Note: The timing values refer to minimum system timing requirements. Actual implementation requires conformance to the specific protocol requirements. Refer to **Chapter 1** to identify the specific input and output signals associated with the referenced internal controllers and supported communication protocols. For example, FCC1 supports ATM/Utopia operation in slave mode, multi-PHY master direct polling mode, and multi-PHY master multiplexed polling mode and each of these modes supports its own set of signals; the direction (input or output) of some of the shared signal names depends on the selected mode.

2.6.7 JTAG Signals

Table 2-22. JTAG Timing

No.	Characteristics	All frequencies		Unit
		Min	Max	
500	TCK frequency of operation	0.0	40.0	MHz
501	TCK cycle time	25.0	—	ns
502	TCK clock pulse width measured at 1.6 V	12.5	—	ns
503	TCK rise and fall times	0.0	3.0	ns
508	TMS, TDI data set-up time	6.0	—	ns
509	TMS, TDI data hold time	3.0	—	ns
510	TCK low to TDO data valid	0.0	15.0	ns
511	TCK low to TDO high impedance	0.0	20.0	ns
512	$\overline{\text{TRST}}$ assert time	100.0	—	ns
513	$\overline{\text{TRST}}$ set-up time to TCK low	40.0	—	ns

Packaging

This chapter provides information about the MSC8101 package, including diagrams of the package pinouts and tables showing how the signals discussed in **Chapter 1** are allocated. The MSC8101 is available in a 332-pin lidded flip chip-plastic ball grid array (FC-PBGA).

3.1 FC-PBGA Package Description

Figure 3-1 and **Figure 3-2** show top and bottom views of the FC-PBGA package, including pinouts. **Table 3-1** lists the MSC8101 signals alphabetically by signal name. Connections with multiple names are listed individually by each name. Signals with programmable polarity are shown both as signals which are asserted low (default) and high (that is, $\overline{\text{NAME}}/\text{NAME}$). **Table 3-2** lists the signals numerically by pin number. Each pin number is listed once with the various signals that are multiplexed to it. For simplicity, signals with programmable polarity are shown in this table only with their default name (asserted low).

Top View

Note: Signal names in this figure are the default signals after reset, except for signals C2, C19, D1, D2, D18, E1, F3, H13, H14, and W11 which show the second configuration signal name.

Figure 3-1. MSC8101 Flip Chip Plastic Ball Grid Array (FC-PBGA), Top View

Bottom View

Note: Signal names in this figure are the default signals after reset, except for signals C2, C19, D1, D2, D18, E1, F3, H13, H14, and W11 which show the second configuration signal name.

3.2 Lidded FC-PBGA Package Mechanical Drawing

CASE 1473-01

Figure 3-3. Case 1473-01 Mechanical Information, 332-pin Lidded FC-PBGA Package

Design Considerations

This chapter includes design and layout guidelines for manufacturing boards using the MSC8102.

4.1 Thermal Design Considerations

The average chip-junction temperature, T_J , in °C can be obtained from the following:

$$T_J = T_A + (P_D \cdot \theta_{JA}) \quad \text{Equation 1}$$

where

T_A = ambient temperature °C

θ_{JA} = package thermal resistance, junction to ambient, °C/W

$P_D = P_{INT} + P_{I/O}$ in W

$P_{INT} = I_{DD} \times V_{DD}$ in W—chip internal power

$P_{I/O}$ = power dissipation on output pins in W—user determined

The user should set T_A and P_D such that T_J does not exceed the maximum operating conditions. In case T_J is too high, the user should either lower the ambient temperature or the power dissipation of the chip.

4.2 Electrical Design Considerations

The input voltage must not exceed the I/O supply V_{DDH} by more than 2.5 V at any time, including during power-on reset. In turn, V_{DDH} can exceed V_{DD}/V_{CCSYN} by more than 3.3 V during power-on reset, but for no more than 100 ms. V_{DDH} should not exceed V_{DD}/V_{CCSYN} by more than 2.1 V during normal operation. V_{DD}/V_{CCSYN} must not exceed V_{DDH} by more than 0.4 V at any time, including during power-on reset. Therefore the recommendation is to use “bootstrap” diodes between the power rails, as shown in **Figure 4-1**.

Figure 4-1. Bootstrap Diodes for Power-Up Sequencing

Select the bootstrap diodes such that a nominal V_{DD}/V_{CCSYN} is sourced from the V_{DDH} power supply until the V_{DD}/V_{CCSYN} power supply becomes active. In **Figure 4-1**, four MUR420 Schottky barrier diodes are connected in series; each has a forward voltage (V_F) of 0.6 V at high currents, so these diodes provide a 2.4 V drop, maintaining 0.9 V on the 1.6 V power line. Once the core/PLL power supply stabilizes at 1.6 V, the bootstrap diodes will be reverse biased with negligible leakage current. The V_F should be effective at the current levels required by the processor. Do not use diodes with a nominal V_F that drops too low at high current.

4.3 Power Considerations

The internal power dissipation consists of three components:

$$P_{INT} = P_{CORE} + P_{SIU} + P_{CPM}$$

Power dissipation depends on the operating frequency of the different portions of the chip. **Table 2-5** provides typical power values at the specified operating frequencies. To determine the typical power dissipation for a given set of frequencies, use the following equations:

$$P_{CORE}(f) = ((P_{CORE} - P_{LCO})/f_{CORE}) \times f_{COREA} + P_{LCO}$$

$$P_{CPM}(f) = ((P_{CPM} - P_{LCP})/f_{CPM}) \times f_{CPMA} + P_{LCP}$$

$$P_{SIU}(f) = ((P_{SIU} - P_{LSI})/f_{SIU}) \times f_{SIUA} + P_{LSI}$$

Where:

f_{CORE} is the core frequency, f_{SIU} is the SIU frequency, and f_{CPM} is the CPM frequency specified in **Table 2-5** in MHz

f_{COREA} is the actual core frequency, f_{SIUA} is the actual SIU frequency, and f_{CPMA} is the actual CPM frequency in MHz

P_{LCO} , P_{LSI} , and P_{LCP} are the leakage power values specified in **Table 2-5**

All power numbers are in mW

Power consumption is assumed to be linear with frequency. The first part of each equation computes a mw/MHz value that is then scaled based on the actual frequency used.

To determine a total power dissipation in a specific application, you must add the power values derived from the above set of equations to the value derived for I/O power consumption using the following equation for each output pin:

$$P = C \times V_{DDH}^2 \times f \times 10^{-3} \quad \text{Equation 2}$$

Where: P = power in mW, C = load capacitance in pF, f = output switching frequency in MHz.

For an application in which external data memory is used in a 32-bit single bus mode and no other outputs are active, the core runs at 200 MHz, the CPM runs at 100 MHz and the SIU runs at 50 MHz, power dissipation is calculated as follows:

Assumptions:

- External data memory is accessed every second cycle with 10% of address pins switching.
- External data memory writes occurs once every eight cycles with 50% of data pins switching.
- Each address and data pin has a 30 pF total load at the pin.
- The application operates at $V_{DDH} = 3.3$ V.

Since the address pins switch once at every second cycle, the address pins frequency is a quarter of the bus frequency (that is, 25 MHz).

For the same reason the data pins frequency is 3.125 MHz.

Table 4-1. Power Dissipation

Pins	Number of Pins Switching	$\times C$	$\times V_{DDH}^2$	$\times f \times 10^{-3}$	Power in mW
Address	4	$\times 30$	$\times 3.3^2$	$\times 12.5 \times 10^{-3}$	16.25
Data, HRD, HRW	34	$\times 30$	$\times 3.3^2$	$\times 3.125 \times 10^{-3}$	34.75
CLKOUT	1	$\times 30$	$\times 3.3^2$	$\times 50 \times 10^{-3}$	16
Total $P_{I/O}$					67

Calculating internal power (from **Table 2-5** values):

$$P_{CORE}(200) = ((P_{CORE} - P_{LCO})/300) \times 200 + P_{LCO} = ((450 - 3) / 300) \times 200 + 3 = 301$$

$$P_{CPM}(100) = ((P_{CPM} - P_{LCP}) / 200) \times 100 + P_{LCP} = ((320 - 6) / 200) \times 100 + 6 = 163$$

$$P_{SIU}(50) = ((P_{SIU} - P_{LSI}) / 100) \times 50 + P_{LSI} = ((80 - 2) / 100) \times 50 + 2 = 41$$

$$P_{INT} = P_{CORE}(200) + P_{CPM}(100) + P_{SIU}(50) = 301 + 163 + 41 = 505$$

$$P_D = P_{INT} + P_{I/O} = 505 + 67 = 572$$

Maximum allowed ambient temperature is:

$$T_A = T_J - (PD \times \theta_{JA})$$

4.4 Layout Practices

Each V_{CC} and V_{DD} pin on the MSC8101 should be provided with a low-impedance path to the board's power supply. Similarly, each GND pin should be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on the chip. The V_{CC} power supply should be bypassed to ground using at least four 0.1 μ F by-pass capacitors located as closely as possible to the four sides of the package. The capacitor leads and associated printed circuit traces connecting to chip V_{CC} , V_{DD} , and GND should be kept to less than half an inch per capacitor lead. A four-layer board is recommended, employing two inner layers as V_{CC} and GND planes.

All output pins on the MSC8101 have fast rise and fall times. Printed circuit board (PCB) trace interconnection length should be minimized in order to minimize undershoot and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data busses. Maximum PCB trace lengths of six inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PCB traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the V_{CC} , V_{DD} , and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

There are 2 pairs of PLL supply pins: V_{CCSYN} - GND_{SYN} and V_{CCSYN1} - GND_{SYN1} . Each pair supplies one PLL. To ensure internal clock stability, filter the power to the V_{CCSYN} and V_{CCSYN1} inputs with a circuit similar to the one in **Figure 0-1**. To filter as much noise as possible, place the circuit as close as possible to V_{CCSYN} and V_{CCSYN1} . The 0.01- μ F capacitor should be closest to V_{CCSYN} and V_{CCSYN1} , followed by the 10- μ F capacitor, the 10-nH inductor, and finally the 10- Ω resistor to V_{DD} . These traces should be kept short and direct.

Design Considerations

GND_{SYN} and GND_{SYN1} should be provided with an extremely low impedance path to ground and should be bypassed to V_{CCSYN} and V_{CCSYN1} , respectively, by a 0.01- μF capacitor located as close as possible to the chip package. The user should also bypass GND_{SYN} and GND_{SYN1} to V_{CCSYN} and V_{CCSYN1} with a 0.01- μF capacitor as closely as possible to the chip package

Figure 0-1. V_{CCSYN} and V_{CCSYN1} Bypass

Ordering Information

Consult a Freescale Semiconductor sales office or authorized distributor to determine product availability and place an order.

Part	Supply Voltage	Package Type	Pin Count	Mask Set	Core Frequency (MHz)	Order Number
MSC8101	1.6 V core 3.3 V I/O	Lidded Flip Chip Plastic Ball Grid Array (FC-PBGA)	332	2K87M	250	MSC8101M1250F
					275	MSC8101M1375F
					300	MSC8101M1500F
