## Description

The Hitachi HM5116400 Series, HM5117400 Series are CMOS dynamic RAMs organized 4,194,304-word × 4-bit. They employ the most advanced 0.5 μm CMOS technology for high performance and low power. The HM5116400 Series, HM5117400 Series offer Fast Page Mode as a high speed access mode. They have package variations of standard 300-mil 26-pin plastic SOJ and standard 300-mil 26-pin plastic TSOP.

## Features

- Single 5 V (±10%)
- Access time: 50 ns/60 ns/70 ns (max)
- Power dissipation
  - Active mode : 495 mW/440 mW/385 mW (max) (HM5116400 Series)  
: 550 mW/495 mW/440 mW (max) (HM5117400 Series)
  - Standby mode : 11 mW (max)  
: 0.83 mW (max) (L-version)
- Fast page mode capability
- Long refresh period
  - 4096 refresh cycles : 64 ms (HM5116400 Series)  
: 128 ms (L-version)
  - 2048 refresh cycles : 32 ms (HM5117400 Series)  
: 128 ms (L-version)
- 3 variations of refresh
  - $\overline{\text{RAS}}$ -only refresh
  - $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh
  - Hidden refresh
- Battery backup operation (L-version)
- Test function
  - 16-bit parallel test mode

### Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Voltage on any pin relative to $V_{SS}$	$V_T$	-1.0 to +7.0	V
Supply voltage relative to $V_{SS}$	$V_{CC}$	-1.0 to +7.0	V
Short circuit output current	$I_{out}$	50	mA
Power dissipation	$P_T$	1.0	W
Operating temperature	$T_{opr}$	0 to +70	°C
Storage temperature	$T_{stg}$	-55 to +125	°C

### Recommended DC Operating Conditions ( $T_a = 0$ to $+70^\circ\text{C}$ )

Parameter	Symbol	Min	Typ	Max	Unit	Note
Supply voltage	$V_{CC}$	4.5	5.0	5.5	V	1
Input high voltage	$V_{IH}$	2.4	—	6.5	V	1
Input low voltage	$V_{IL}$	-1.0	—	0.8	V	1

Note: 1. All voltage referred to  $V_{SS}$ .

---

## HM5116400 Series, HM5117400 Series

---

- Notes:
1. AC measurements assume  $t_T = 5$  ns.
  2. An initial pause of 200  $\mu$ s is required after power up followed by a minimum of eight initialization cycles (any combination of cycles containing  $\overline{\text{RAS}}$ -only refresh or  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh). If the internal refresh counter is used, a minimum of eight  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycles are required.
  3. Operation with the  $t_{\text{RCD}}$  (max) limit insures that  $t_{\text{RAC}}$  (max) can be met,  $t_{\text{RCD}}$  (max) is specified as a reference point only; if  $t_{\text{RCD}}$  is greater than the specified  $t_{\text{RCD}}$  (max) limit, then access time is controlled exclusively by  $t_{\text{CAC}}$ .
  4. Operation with the  $t_{\text{RAD}}$  (max) limit insures that  $t_{\text{RAC}}$  (max) can be met,  $t_{\text{RAD}}$  (max) is specified as a reference point only; if  $t_{\text{RAD}}$  is greater than the specified  $t_{\text{RAD}}$  (max) limit, then access time is controlled exclusively by  $t_{\text{AA}}$ .
  5. Either  $t_{\text{OED}}$  or  $t_{\text{CDD}}$  must be satisfied.
  6. Either  $t_{\text{DZO}}$  or  $t_{\text{DZC}}$  must be satisfied.
  7.  $V_{\text{IH}}$  (min) and  $V_{\text{IL}}$  (max) are reference levels for measuring timing of input signals. Also, transition times are measured between  $V_{\text{IH}}$  (min) and  $V_{\text{IL}}$  (max).
  8. Assumes that  $t_{\text{RCD}} \leq t_{\text{RCD}}$  (max) and  $t_{\text{RAD}} \leq t_{\text{RAD}}$  (max). If  $t_{\text{RCD}}$  or  $t_{\text{RAD}}$  is greater than the maximum recommended value shown in this table,  $t_{\text{RAC}}$  exceeds the value shown.
  9. Measured with a load circuit equivalent to 2 TTL loads and 100 pF.
  10. Assumes that  $t_{\text{RCD}} \geq t_{\text{RCD}}$  (max) and  $t_{\text{RCD}} + t_{\text{CAC}}$  (max)  $\geq t_{\text{RAD}} + t_{\text{AA}}$  (max).
  11. Assumes that  $t_{\text{RAD}} \geq t_{\text{RAD}}$  (max) and  $t_{\text{RCD}} + t_{\text{CAC}}$  (max)  $\leq t_{\text{RAD}} + t_{\text{AA}}$  (max).
  12. Either  $t_{\text{RCH}}$  or  $t_{\text{RRH}}$  must be satisfied for a read cycles.
  13.  $t_{\text{OFF}}$  (max) and  $t_{\text{OEZ}}$  (max) define the time at which the outputs achieve the open circuit condition and are not referred to output voltage levels.
  14.  $t_{\text{WCS}}$ ,  $t_{\text{RWD}}$ ,  $t_{\text{CWD}}$ ,  $t_{\text{AWD}}$  and  $t_{\text{CPW}}$  are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if  $t_{\text{WCS}} \geq t_{\text{WCS}}$  (min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if  $t_{\text{RWD}} \geq t_{\text{RWD}}$  (min),  $t_{\text{CWD}} \geq t_{\text{CWD}}$  (min), and  $t_{\text{AWD}} \geq t_{\text{AWD}}$  (min), or  $t_{\text{CWD}} \geq t_{\text{CWD}}$  (min),  $t_{\text{AWD}} \geq t_{\text{AWD}}$  (min) and  $t_{\text{CPW}} \geq t_{\text{CPW}}$  (min), the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
  15. These parameters are referred to  $\overline{\text{CAS}}$  leading edge in early write cycles and to  $\overline{\text{WE}}$  leading edge in delayed write or read-modify-write cycles.
  16.  $t_{\text{RASP}}$  defines  $\overline{\text{RAS}}$  pulse width in Fast page mode cycles.
  17. Access time is determined by the longest among  $t_{\text{AA}}$ ,  $t_{\text{CAC}}$  and  $t_{\text{CPA}}$ .
  18. In delayed write or read-modify-write cycles,  $\overline{\text{OE}}$  must disable output buffer prior to applying data to the device.
  19. The 16M DRAM offers a 16-bit time saving parallel test mode. Address CA0 and CA1 for the 4M  $\times$  4 are don't care during test mode. Test mode is set by performing a  $\overline{\text{WE}}$ -and- $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  (WCBR) cycle. In 16-bit parallel test mode, data is written into 4 bits in parallel at each I/O (I/O1 to I/O4) and read out from each I/O.  
If 4 bits of each I/O are equal (all 1s or 0s), data output pin is a high state during test mode read cycle, then the device has passed. If they are not equal, data output pin is a low state, then the device has failed.  
Refresh during test mode operation can be performed by normal read cycles or by WCBR refresh cycles.  
To get out of test mode and enter a normal operation mode, perform either a regular  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle or  $\overline{\text{RAS}}$ -only refresh cycle.
  20. In a test mode read cycle, the value of  $t_{\text{RAC}}$ ,  $t_{\text{AA}}$ ,  $t_{\text{CAC}}$  and  $t_{\text{CPA}}$  is delayed by 2 ns to 5 ns for the specified value. These parameters should be specified in test mode cycles by adding the above value to the specified value in this data sheet.

- Notes:
1. AC measurements assume  $t_T = 5$  ns.
  2. An initial pause of 200  $\mu$ s is required after power up followed by a minimum of eight initialization cycles (any combination of cycles containing  $\overline{\text{RAS}}$ -only refresh or  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh). If the internal refresh counter is used, a minimum of eight  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycles are required.
  3. Operation with the  $t_{\text{RCD}}$  (max) limit insures that  $t_{\text{RAC}}$  (max) can be met,  $t_{\text{RCD}}$  (max) is specified as a reference point only; if  $t_{\text{RCD}}$  is greater than the specified  $t_{\text{RCD}}$  (max) limit, then access time is controlled exclusively by  $t_{\text{CAC}}$ .
  4. Operation with the  $t_{\text{RAD}}$  (max) limit insures that  $t_{\text{RAC}}$  (max) can be met,  $t_{\text{RAD}}$  (max) is specified as a reference point only; if  $t_{\text{RAD}}$  is greater than the specified  $t_{\text{RAD}}$  (max) limit, then access time is controlled exclusively by  $t_{\text{AA}}$ .
  5. Either  $t_{\text{OED}}$  or  $t_{\text{CDD}}$  must be satisfied.
  6. Either  $t_{\text{DZO}}$  or  $t_{\text{DZC}}$  must be satisfied.
  7.  $V_{\text{IH}}$  (min) and  $V_{\text{IL}}$  (max) are reference levels for measuring timing of input signals. Also, transition times are measured between  $V_{\text{IH}}$  (min) and  $V_{\text{IL}}$  (max).
  8. Assumes that  $t_{\text{RCD}} \leq t_{\text{RCD}}$  (max) and  $t_{\text{RAD}} \leq t_{\text{RAD}}$  (max). If  $t_{\text{RCD}}$  or  $t_{\text{RAD}}$  is greater than the maximum recommended value shown in this table,  $t_{\text{RAC}}$  exceeds the value shown.
  9. Measured with a load circuit equivalent to 2 TTL loads and 100 pF.
  10. Assumes that  $t_{\text{RCD}} \geq t_{\text{RCD}}$  (max) and  $t_{\text{RCD}} + t_{\text{CAC}}$  (max)  $\geq t_{\text{RAD}} + t_{\text{AA}}$  (max).
  11. Assumes that  $t_{\text{RAD}} \geq t_{\text{RAD}}$  (max) and  $t_{\text{RCD}} + t_{\text{CAC}}$  (max)  $\leq t_{\text{RAD}} + t_{\text{AA}}$  (max).
  12. Either  $t_{\text{RCH}}$  or  $t_{\text{RRH}}$  must be satisfied for a read cycles.
  13.  $t_{\text{OFF}}$  (max) and  $t_{\text{OEZ}}$  (max) define the time at which the outputs achieve the open circuit condition and are not referred to output voltage levels.
  14.  $t_{\text{WCS}}$ ,  $t_{\text{RWD}}$ ,  $t_{\text{CWD}}$ ,  $t_{\text{AWD}}$  and  $t_{\text{CPW}}$  are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if  $t_{\text{WCS}} \geq t_{\text{WCS}}$  (min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if  $t_{\text{RWD}} \geq t_{\text{RWD}}$  (min),  $t_{\text{CWD}} \geq t_{\text{CWD}}$  (min), and  $t_{\text{AWD}} \geq t_{\text{AWD}}$  (min), or  $t_{\text{CWD}} \geq t_{\text{CWD}}$  (min),  $t_{\text{AWD}} \geq t_{\text{AWD}}$  (min) and  $t_{\text{CPW}} \geq t_{\text{CPW}}$  (min), the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
  15. These parameters are referred to  $\overline{\text{CAS}}$  leading edge in early write cycles and to  $\overline{\text{WE}}$  leading edge in delayed write or read-modify-write cycles.
  16.  $t_{\text{RASP}}$  defines  $\overline{\text{RAS}}$  pulse width in Fast page mode cycles.
  17. Access time is determined by the longest among  $t_{\text{AA}}$ ,  $t_{\text{CAC}}$  and  $t_{\text{CPA}}$ .
  18. In delayed write or read-modify-write cycles,  $\overline{\text{OE}}$  must disable output buffer prior to applying data to the device.
  19. The 16M DRAM offers a 16-bit time saving parallel test mode. Address CA0 and CA1 for the 4M  $\times$  4 are don't care during test mode. Test mode is set by performing a  $\overline{\text{WE}}$ -and- $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  (WCBR) cycle. In 16-bit parallel test mode, data is written into 4 bits in parallel at each I/O (I/O1 to I/O4) and read out from each I/O.  
If 4 bits of each I/O are equal (all 1s or 0s), data output pin is a high state during test mode read cycle, then the device has passed. If they are not equal, data output pin is a low state, then the device has failed.  
Refresh during test mode operation can be performed by normal read cycles or by WCBR refresh cycles.  
To get out of test mode and enter a normal operation mode, perform either a regular  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle or  $\overline{\text{RAS}}$ -only refresh cycle.
