Notes: 1. H: High (inactive) L: Low (active) D: H or L

2. $t_{WCS} \geq 0$ ns Early write cycle

   $t_{WCS} < 0$ ns Delayed write cycle

3. Mode is determined by the OR function of the $\overline{UCAS}$ and $\overline{LCAS}$. (Mode is set by the earliest of $\overline{UCAS}$ and $\overline{LCAS}$ active edge and reset by the latest of $\overline{UCAS}$ and $\overline{LCAS}$ inactive edge.) However write OPERATION and output High-Z control are done independently by each $\overline{UCAS}$, $\overline{LCAS}$.

   ex. if $\overline{RAS}$ = H to L, $\overline{UCAS}$ = H, $\overline{LCAS}$ = L, then $\overline{CAS}$-before-$\overline{RAS}$ refresh cycle is selected.

$\overline{CAS}$ hold time (self refresh)	t_{CHS}	–50	—	–50	—	–50	—	ns	

Notes:
1. AC measurements assume t_T = 2 ns.
2. An initial pause of 200 µs is required after power up followed by a minimum of eight initialization cycles (any combination of cycles containing $\overline{RAS}$-only refresh or $\overline{CAS}$-before-$\overline{RAS}$ refresh).
3. Operation with the t_{RCD} (max) limit insures that t_{RAC} (max) can be met, t_{RCD} (max) is specified as a reference point only; if $t_{RCD} \geq t_{RAD}$ (max) + t_{AA} (max) – t_{CAC} (max), then access time is controlled exclusively by t_{CAC}.
4. Operation with the t_{RAD} (max) limit insures that t_{RAC} (max) can be met, t_{RAD} (max) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (max) limit, then access time is controlled exclusively by t_{AA}.
5. Either t_{OED} or t_{CDD} must be satisfied.
6. Either t_{DZO} or t_{DZC} must be satisfied.
7. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} (min) and V_{IL} (max).
8. Assumes that $t_{RCD} \leq t_{RCD}$ (max) and $t_{RAD} \leq t_{RAD}$ (max). If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
9. Measured with a load circuit equivalent to 1 TTL loads and 100 pF.
10. Assumes that $t_{RCD} \geq t_{RCD}$ (max) and $t_{RCD} + t_{CAC}$ (max) $\geq t_{RAD} + t_{AA}$ (max).
11. Assumes that $t_{RAD} \geq t_{RAD}$ (max) and $t_{RCD} + t_{CAC}$ (max) $\leq t_{RAD} + t_{AA}$ (max).
12. Either t_{RCH} or t_{RRH} must be satisfied for a read cycles.
13. t_{OFF} (max) and t_{OEZ} (max) define the time at which the outputs achieve the open circuit condition and are not referred to output voltage levels.
14. t_{WCS}, t_{RWD}, t_{CWD}, t_{AWD} and t_{CPW} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if $t_{WCS} \geq t_{WCS}$ (min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{RWD} \geq t_{RWD}$ (min), $t_{CWD} \geq t_{CWD}$ (min), and $t_{AWD} \geq t_{AWD}$ (min), or $t_{CWD} \geq t_{CWD}$ (min), $t_{AWD} \geq t_{AWD}$ (min) and $t_{CPW} \geq t_{CPW}$ (min), the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
15. These parameters are referred to $\overline{UCAS}$ and $\overline{LCAS}$ leading edge in early write cycles and to $\overline{WE}$ leading edge in delayed write or read-modify-write cycles.
16. t_{RASP} defines $\overline{RAS}$ pulse width in EDO page mode cycles.
17. Access time is determined by the longest among t_{AA}, t_{CAC} and t_{CPA}.
18. In delayed write or read-modify-write cycles, $\overline{OE}$ must disable output buffer prior to applying data to the device.
19. When both $\overline{UCAS}$ and $\overline{LCAS}$ go low at the same time, all 16-bit data are written into the device. $\overline{UCAS}$ and $\overline{LCAS}$ cannot be staggered within the same write/read cycles.

20 All the V_{CC} and V_{SS} pins shall be supplied with the same voltages.

21. t_{ASC}, t_{CAH}, t_{RCS}, t_{WCS}, t_{WCH}, t_{CSR} and t_{RPC} are determined by the earlier falling edge of $\overline{UCAS}$ or $\overline{LCAS}$.

22. t_{CRP}, t_{CHR}, t_{RCH}, t_{CPA} and t_{CPW} are determined by the later rising edge of $\overline{UCAS}$ or $\overline{LCAS}$.

23. t_{CWL}, t_{DH}, t_{DS} and t_{CSH} should be satisfied by both $\overline{UCAS}$ and $\overline{LCAS}$.

24. t_{CP} is determined by the time that both $\overline{UCAS}$ and $\overline{LCAS}$ are high.

25. t_{HPC} (min) can be achieved during a series of EDO page mode write cycles or EDO page mode read cycles. If both write and read operation are mixed in a EDO page mode $\overline{RAS}$ cycle (EDO page mode mix cycle (1), (2)), minimum value of $\overline{CAS}$ cycle ($t_{CAS} + t_{CP} + 2\ t_T$) becomes greater than the specified t_{HPC} (min) value. The value of $\overline{CAS}$ cycle time of mixed EDO page mode is shown in EDO page mode mix cycle (1) and (2).

26. When output buffers are enabled once, sustain the low impedance state until valid data is obtained. When output buffer is turned on and off within a very short time, generally it causes large V_{CC}/V_{SS} line noise, which causes to degrade V_{IH} min/V_{IL} max level.

27. Data output turns off and becomes high impedance from later rising edge of $\overline{RAS}$ and $\overline{CAS}$. Hold time and turn off time are specified by the timing specifications of later rising edge of $\overline{RAS}$ and $\overline{CAS}$ between t_{OHR} and t_{OH}, and between t_{OFR} and t_{OFF}.

28. Please do not use t_{RASS} timing, 10 µs ≤ t_{RASS} ≤ 100 µs. During this period, the device is in transition state from normal operation mode to self refresh mode. If t_{RASS} ≥ 100 µs, then $\overline{RAS}$ precharge time should use t_{RPS} instead of t_{RP}.

29. If you use distributed CBR refresh mode with 15.6 µs interval in normal read/write cycle, CBR refresh should be executed within 15.6 µs immediately after exiting from and before entering into self refresh mode.

30. If you use $\overline{RAS}$ only refresh or CBR burst refresh mode in normal read/write cycle, 1024 cycles of distributed CBR refresh with 15.6 µs interval should be executed within 16 ms immediately after exiting from and before entering into the self refresh mode.

31. Repetitive self refresh mode without refreshing all memory is not allowed. Once you exit from self fresh mode, all memory cells need to be refreshed before re-entering the self refresh mode again.

32. XXX: H or L (H: V_{IH} (min) ≤ V_{IN} ≤ V_{IH} (max), L: V_{IL} (min) ≤ V_{IN} ≤ V_{IL} (max))

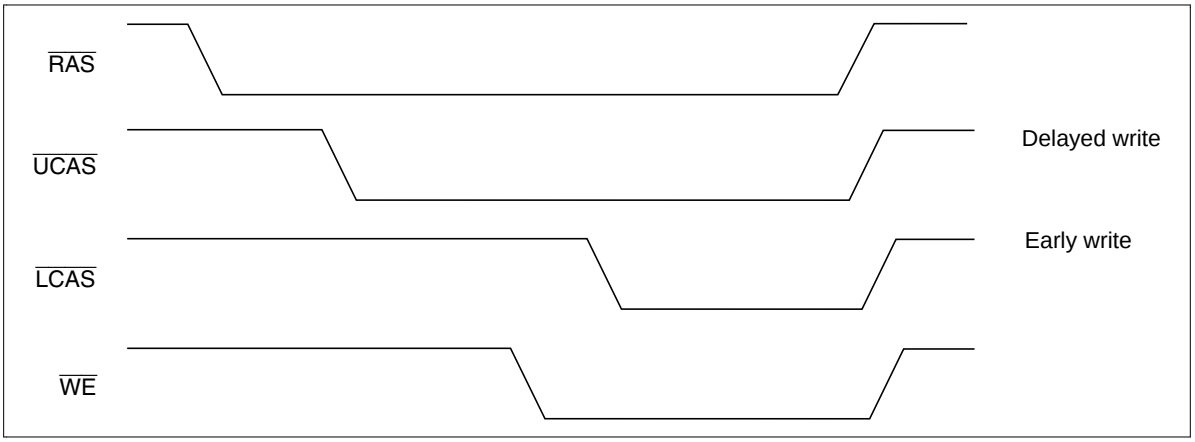
    ///////: Invalid Dout

    When the address, clock and input pins are not described on timing waveforms, their pins must be applied V_{IH} or V_{IL}.

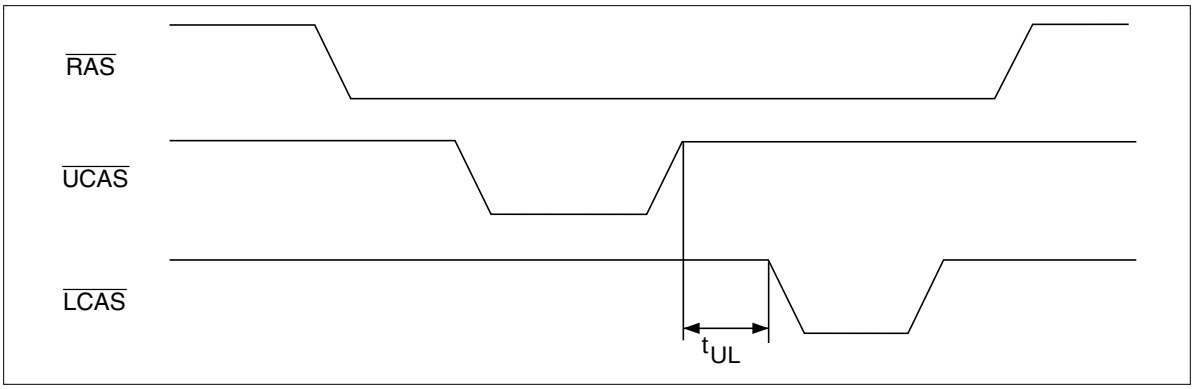
Notes concerning 2$\overline{CAS}$ control

Please do not separate the $\overline{UCAS}$/$\overline{LCAS}$ operation timing intentionally. However skew between $\overline{UCAS}$/$\overline{LCAS}$ are allowed under the following conditions.

1. Each of the $\overline{UCAS}$/$\overline{LCAS}$ should satisfy the timing specifications individually.
2. Different operation mode for upper/lower byte is not allowed; such as following.



3. Closely separated upper/lower byte control is not allowed. However when the condition ($t_{CP} \leq t_{UL}$) is satisfied, EDO page mode can be performed.



4. Byte control operation by remaining $\overline{UCAS}$ or $\overline{LCAS}$ high is guaranteed.
