# Infrared IrDA Compliant Transceiver 

## Technical Data

## HSDL-1001

## Features

- Fully Compliant to IrDA 1.0 - $115 \mathrm{~Kb} / \mathrm{s}$
- Compatible with ASK, Consumer IR/TV Remote
- Superb Nose-to-Nose Operation
- Low Power Consumption $3 \mu \mathrm{~A}$ in Shutdown
- Supply Voltage Range 2.7 V-5.5 V
- Operational Down to 2 V
- Free Netlist for IrDA Modulation Circuitry
- Low Latency $100 \mu \mathrm{~s}$
- Available in Tape \& Reel for Auto Insertion
- Drop in Replacement for HSDL-1000

* SIDE BUTTRESS LEADS ARE FOR MECHANICAL STABILITY AND SHOULD NOT BE CONNECTED TO ANY ELECTRICAL POTENTIAL.

## Package Dimensions

## Option 0X2*

NOTE:
THE -B- DATUM IS FORMED BY THE TWO HIGHEST POINTS OF THE COMBINDED SURFACE FORMED BY THIS SURFACE AND THE CORRESPONDING SURFACE OF THE SAME LEAD ON THE OPPOSITE SIDE OF THE PACKAGE.
$0=$ TAPE AND REEL.
X = STRIP OF 10.
1 = JEDEC STANDARD ARRAY.

dimensions in millimeters (inches).

$X=$ Don't care
NV = Not Valid
Notes:

1. EI - Irradiance (light intensity) present at detector surface.
2. For in-band IrDA signals $\leq 115 \mathrm{~kb} / \mathrm{s}$.
3. RXD Low is a pulsed response. The condition is maintained for a duration dependent on the pattern and strength of the incident signal.

## Electrical \& Optical Specifications

Specifications hold over $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{CC}} \leq 5.5 \mathrm{~V}$ and $0^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq 70^{\circ} \mathrm{C}$ and all typicals are at $\mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V}$ and $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ unless otherwise specified. Listed conditions represent worst case values for the parameters under test. Unspecified test conditions can be anywhere in their recommended operating range.

## Notes:

1. Pulsed Response - Logic Low is a pulsed response. A receiver output low state $V_{O L}(R X D)$ is not indefinitely maintained but is instead a pulsed response. The output low state is maintained for a duration dependent on the incident bit pattern and incident intensity (EI).
2. The $\mathrm{E}_{\mathrm{I}} \geq 3.6 \mu \mathrm{~W} / \mathrm{cm}^{2}$ condition guarantees the IrDA minimum receiver sensitivity of $4.0 \mu \mathrm{~W} / \mathrm{cm}^{2}$ while allowing for $10 \%$ light loss through a cosmetic window placed in front of the HSDL-1001.

| CX 3 | $0.10 \mu \mathrm{~F} \pm 22 \%$. XR7 Ceramic, Lead Length $\leq 5 \mathrm{~mm}$. |
| CX 4 | $4.7 \mu \mathrm{~F}$ minimum. Larger values recommended for |
|  | noisy supplies or environments. |

## Appendix A. Test Methods

## A.1. Background Light and Electromagnetic Field

There are four ambient interference conditions in which the receiver is to operate correctly. The conditions are to be applied separately:

1. Electromagnetic field: $3 \mathrm{~V} / \mathrm{m}$ maximum (refer to IEC 801-3. severity level 3 for details)
2. Sunlight: 10 kilolux maximum at the optical port

This is simulated with an IR source having a peak wavelength within the range 850 nm to 900 nm and a spectral width less than 50 nm biased to provide $490 \mu \mathrm{~W} / \mathrm{cm}^{2}$ (with no modulation) at the optical port. The light source faces the optical port.

This simulates sunlight within the IrDA spectral range. The effect of longer wavelength radiation is covered by the incandescent condition.
3. Incandescent Lighting: 1000 lux maximum

This is produced with general service, tungsten-filament, gasfilled, inside-frosted lamps in the 60 Watt to 150 Watt range to generate 1000 lux over the horizontal surface on which the equipment under test rests. The light sources are above the test area. The source is expected to have a filament temperature in the 2700 to 3050 degrees Kelvin range and a spectral peak in the 850 nm to 1050 nm range.
4. Fluorescent Lighting: 1000 lux maximum

This is simulated with an IR source having a peak wavelength within the range 850 nm to 900 nm and a spectral width of less than 50 nm biased and modulated to provide an optical square wave signal ( $0 \mu \mathrm{~W} / \mathrm{cm}^{2}$ minimum and $0.3 \mu \mathrm{~W} / \mathrm{cm}^{2}$ peak amplitude with $10 \%$ to $90 \%$ rise and fall times less than or equal to 100 ns ) over the horizontal surface on which the equipment under test rests. The light sources are above the test area. The frequency of the optical signal is swept over the frequency range from 20 kHz to 200 kHz .

Due to the variety of fluorescent lamps and the range of IR emissions, this condition is not expected to cover all circumstances. It will provide a common floor for IrDA operation.
