[MEMO]

## NOTES FOR CMOS DEVICES

### ① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

### ② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

### ③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

These commodities, technology or software, must be exported in accordance with the export administration regulations of the exporting country. Diversion contrary to the law of that country is prohibited.

• **The information in this document is current as of March, 2003. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**

- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".

The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)

- (1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).

# Regional Information

Some information contained in this document may vary from country to country. Before using any NEC Electronics product in your application, please contact the NEC Electronics office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

## Major Revisions in This Edition (1/3)

Page	Description
Throughout	Addition of description of expanded specification (12 MHz)
p. 24	Revision of <b>1.6 78K/0 Series Lineup</b>
p. 36	Addition of description about pin handling to <b>2.2.16 V<sub>PP</sub> (flash memory versions only)</b>
p. 37	Modification of description in <b>Table 2-1 Pin I/O Circuit Types</b>
p. 45	Addition of description about programming area to <b>3.1.2 Internal data memory space</b>
pp. 53, 54	Modification of <b>Figure 3-14 Data to Be Saved to Stack Memory</b> and <b>Figure 3-15 Data to Be Restored from Stack Memory</b>
p. 65	Modification of <b>[Description example]</b> in <b>3.4.4 Short direct addressing</b>
pp. 68 to 70	Addition of <b>[Illustration]</b> to <b>3.4.7 Based addressing</b> , <b>3.4.8 Based indexed addressing</b> , and <b>3.4.9 Stack addressing</b>
pp. 74 to 86	Modification of port block diagrams ( <b>Figure 4-2 to Figure 4-15</b> )
p. 89	Addition of <b>Table 4-3 Port Mode Registers and Output Latch Settings When Alternate Function Is Used</b>
p. 95	Addition of description of internal feedback resistor and oscillation stabilization time select register (OSTS) to <b>5.3 Registers Controlling Clock Generator</b>
p. 108	Modification of <b>Figure 6-1 Block Diagram of 16-Bit Timer/Event Counter 0</b>
p.109 of previous edition pp.109, 110	Change of <b>Table 6-2 TI00/TO0/P70 Pin Valid Edge and CR00, CR01 Capture Trigger</b> and <b>Table 6-3 TI01/P71 Pin Valid Edge and CR00 Capture Trigger</b> in the previous edition to <b>Table 6-2 CR00 Capture Trigger and Valid Edges of TI00 and TI01 Pins</b> and <b>Table 6-3 CR01 Capture Trigger and Valid Edge of TI00 Pin (CRC02 = 1)</b>
p. 116	Change of explanation order of each function in <b>6.4 Operations of 16-Bit Timer/Event Counter 0</b>
p. 129	Addition of <b>Figure 6-26 PPG Output Configuration Diagram</b> and <b>Figure 6-27 PPG Output Operation Timing</b>
p. 130	Addition of <b>6.5 Program List</b>
pp. 137, 139	Modification of <b>6.6 (3) Capture register data retention timing</b> Addition of <b>(11) STOP mode or main system clock stop mode setting</b>
p. 141	Modification of <b>Figure 7-1 Block Diagram of 8-Bit Timer/Event Counter 50</b> and <b>Figure 7-2 Block Diagram of 8-Bit Timer/Event Counter 51</b>
p. 141 of previous edition	Deletion of <b>Caution</b> in <b>Figure 7-5 Format of 8-Bit Timer Mode Control Register 5n (TMC5n)</b> in the previous edition
p. 151	Addition of <b>[Setting]</b> to <b>7.4.2 Operation as external event counter</b>
p. 152	Addition of description about frequency to <b>[Setting]</b> in <b>7.4.3 Operation as square-wave output (8-bit resolution)</b>
p. 153	Addition of descriptions about frequency and duty ratio to <b>7.4.4 Operation as 8-bit PWM output</b>
p. 158	Addition of <b>7.5 Program List</b>
p.154 of previous edition	Deletion of <b>7.5 (2) Operation after compare register change during timer count operation</b> in the previous edition
p.162 of previous edition	Deletion of oscillation stabilization time select register (OSTS) from <b>9.3 Registers to Control Watchdog Timer</b> in the previous edition

## Major Revisions in This Edition (2/3)

Page	Description
p. 172	Modification of <b>Figure 10-1 Block Diagram of Clock Output/Buzzer Output Controller</b>
pp. 179, 180	Modification of description in <b>11.2 (3) Sample &amp; hold circuit</b> and <b>(4) Voltage comparator</b> , and addition of <b>(10) ADTRG pin</b>
p. 185	Addition of <b>Table 11-2 Sampling Time and A/D Conversion Start Delay Time of A/D Converter</b>
pp. 196, 198	Deletion of <b>11.6 (4) Noise countermeasures</b> (those deleted are added to <b>Figure 11-19 Example of Connecting Capacitor to AV<sub>REF</sub> Pin</b> and <b>Figure 11-21 Example of Connection When Signal Source Impedance Is High</b> ) Addition of <b>(14) Input impedance of ANI0 to ANI3 pins</b>
p. 201	Addition of <b>Figure 12-2 Format of A/D Conversion Result Register 0 (ADCR0)</b>
pp. 201, 202	Modification of description in <b>12.2 (3) Sample &amp; hold circuit</b> and <b>(4) Voltage comparator</b> , and addition of <b>(10) ADTRG pin</b>
p. 207	Addition of <b>Table 12-2 Sampling Time and A/D Conversion Start Delay Time of A/D Converter</b>
pp. 218, 220	Deletion of <b>12.6 (4) Noise countermeasures</b> (those deleted are added to <b>Figure 12-20 Example of Connecting Capacitor to AV<sub>REF</sub> Pin</b> and <b>Figure 12-22 Example of Connection When Signal Source Impedance Is High</b> ) Addition of <b>(14) Input impedance of ANI0 to ANI7 pins</b>
p. 222	Modification of <b>Figure 13-1 Block Diagram of Serial Interface UART0</b>
p. 224	Shift of description about asynchronous serial interface status register 0 (ASIS0) from <b>13.3 Registers Controlling Serial Interface UART0</b> to <b>13.2 Configuration of Serial Interface UART0</b>
p. 234	Addition of <b>Caution</b> to <b>Figure 13-7 Error Tolerance (When k = 0), Including Sampling Errors</b>
p. 238	Modification of <b>Caution</b> in <b>Figure 13-10 Timing of Asynchronous Serial Interface Receive Completion Interrupt Request</b>
pp. 240, 245	Addition of <b>(1) Registers to be used</b> and <b>(3) Relationship between main system clock and baud rate</b> to <b>13.4.3 Infrared data transfer mode</b>
p. 247	Addition of <b>Table 13-6 Register Settings</b>
p. 248	Modification of <b>Figure 14-1 Block Diagram of Serial Interface SIO3n</b>
pp. 251, 252	Addition of <b>Notes 1 and 3</b> and <b>Caution</b> to <b>Figure 14-2 Format of Serial Operation Mode Register 30 (CSIM30)</b> and <b>Figure 14-3 Format of Serial Operation Mode Register 31 (CSIM31)</b>
p. 258	Addition of <b>Table 14-2 Register Settings</b>
p. 262	Modification of <b>(E) Software interrupt</b> in <b>Figure 15-1 Basic Configuration of Interrupt Function</b>
p. 264	Addition of <b>Caution 5</b> to <b>Figure 15-2 Format of Interrupt Request Flag Register (IF0L, IF0H, IF1L)</b>
p. 267	Addition of <b>Caution</b> to <b>Figure 15-5 Format of External Interrupt Rising Edge Enable Register (EGP) and External Interrupt Falling Edge Enable Register (EGN)</b>

### Major Revisions in This Edition (3/3)

Page	Description
p. 269	Addition of description and <b>Remark</b> to <b>15.4.1 Non-maskable interrupt request acknowledge operation</b>
p. 272	Addition of description to <b>15.4.2 Maskable interrupt request acknowledge operation</b>
p. 275	Addition of item to <b>Table 15-4 Interrupt Requests Enabled for Multiple Interrupt During Interrupt Servicing</b>
p. 281	Addition of clock output and buzzer output to <b>Table 16-1 HALT Mode Operating Status</b>
p. 284	Correction of clock output in <b>Table 16-3 STOP Mode Operating Status</b>
p. 291	Modification of <b>CHAPTER 18 <math>\mu</math>PD78F0034BS</b>
p. 318	Modification of <b>CHAPTER 20 ELECTRICAL SPECIFICATIONS</b>
p. 346	Modification of <b>APPENDIX B DEVELOPMENT TOOLS</b>
p. 354	Addition of <b>APPENDIX C NOTES ON TARGET SYSTEM DESIGN</b>

The mark ★ shows major revised points.

## INTRODUCTION

### Readers

This manual has been prepared for user engineers who understand the functions of the  $\mu$ PD780024AS, 780034AS Subseries and wish to design and develop application systems and programs for these devices.

$\mu$ PD780024AS Subseries:  $\mu$ PD780021AS, 780022AS, 780023AS, 780024AS, 780021AS(A), 780022AS(A), 780023AS(A), 780024AS(A)  
 $\mu$ PD780034AS Subseries:  $\mu$ PD780031AS, 780032AS, 780033AS, 780034AS, 78F0034BS, 780031AS(A), 780032AS(A), 780033AS(A), 780034AS(A), 78F0034BS(A)

### Purpose

This manual is intended to give users an understanding of the functions described in the **Organization** below.

### Organization

The  $\mu$ PD780024AS, 780034AS Subseries manual is separated into two parts: this manual and the instructions edition (common to the 78K/0 Series).

**$\mu$ PD780024AS, 780034AS Subseries  
User's Manual  
(This Manual)**

**78K/0 Series  
User's Manual  
Instructions**

- Pin functions
  - Internal block functions
  - Interrupt
  - Other on-chip peripheral functions
  - Electrical specifications
- CPU functions
  - Instruction set
  - Explanation of each instruction

**How to Read This Manual** It is assumed that the reader of this manual has general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

- For readers who use this as an (A) product:
  - Standard products differ from (A) products in their quality grade only. Re-read the product name as indicated below if your product is an (A) product.

$\mu$ PD780021AS →  $\mu$ PD780021AS(A)  
 $\mu$ PD780022AS →  $\mu$ PD780022AS(A)  
 $\mu$ PD780023AS →  $\mu$ PD780023AS(A)  
 $\mu$ PD780024AS →  $\mu$ PD780024AS(A)  
 $\mu$ PD780031AS →  $\mu$ PD780031AS(A)  
 $\mu$ PD780032AS →  $\mu$ PD780032AS(A)  
 $\mu$ PD780033AS →  $\mu$ PD780033AS(A)  
 $\mu$ PD780034AS →  $\mu$ PD780034AS(A)  
 $\mu$ PD78F0034BS →  $\mu$ PD78F0034BS(A)

- To gain a general understanding of functions:
  - Read this manual in the order of the **CONTENTS**.
- How to interpret the register format:
  - For the bit number enclosed in brackets, the bit name is defined as a reserved word in RA78K0, and in CC78K0, already defined in the header file named sfrbit.h.
- To check the details of a register when you know the register name.
  - Refer to **APPENDIX D REGISTER INDEX**.

**Differences Between  $\mu$ PD780024AS and 780034AS Subseries**

The resolution of the A/D converter differ between the  $\mu$ PD780024AS and 780034AS Subseries products.

Item	Subseries	$\mu$ PD780024AS	$\mu$ PD780034AS
A/D converter		8-bit resolution	10-bit resolution

**Conventions**

Data significance: Higher digits on the left and lower digits on the right  
 Active low representation:  $\overline{\text{xxx}}$  (overscore over pin or signal name)  
**Note:** Footnote for item marked with **Note** in the text  
**Caution:** Information requiring particular attention  
**Remark:** Supplementary information  
 Numerical representation: Binary ... xxxx or xxxxB  
 Decimal ... xxxx  
 Hexadecimal ... xxxxH

## CHAPTER 1 OUTLINE

### 1.1 Features

- Internal memory

Part Number \ Type	Program Memory (ROM/Flash Memory)	Data Memory (High-Speed RAM)
$\mu$ PD780021AS, 780031AS	8 KB	512 bytes
$\mu$ PD780022AS, 780032AS	16 KB	
$\mu$ PD780023AS, 780033AS	24 KB	1024 bytes
$\mu$ PD780024AS, 780034AS	32 KB	
$\mu$ PD78F0034BS	32 KB <sup>Note</sup>	1024 bytes <sup>Note</sup>

**Note** The capacities of internal flash memory and internal high-speed RAM can be changed by means of the memory size switching register (IMS).

- External memory expansion space: 64 KB
- ★ Minimum instruction execution time changeable from high speed (0.166  $\mu$ s: @ 12 MHz operation when  $V_{DD} = 4.5$  to 5.5 V with main system clock) to ultra-low speed (122  $\mu$ s: @ 32.768 kHz operation with subsystem clock)
- Instruction set suited to system control
  - Bit manipulation possible in all address spaces
  - Multiply and divide instructions
- I/O ports: 39
- 8-bit resolution A/D converter: 4 channels ( $\mu$ PD780024AS Subseries only)
- 10-bit resolution A/D converter: 4 channels ( $\mu$ PD780034AS Subseries only)
- Serial interface: 3 channels
  - 3-wire serial I/O mode: 2 channels
  - UART mode: 1 channel
- Timer: Five channels
  - 16-bit timer/event counter: 1 channel
  - 8-bit timer/event counter: 2 channels
  - Watch timer: 1 channel
  - Watchdog timer: 1 channel
- Vectored interrupt sources: 20
- Two types of on-chip clock oscillators (main system clock and subsystem clock)
- Power supply voltage:  $V_{DD} = 1.8$  to 5.5 V

## 1.2 Applications

μPD780021AS, 780022AS, 780023AS, 780024AS

μPD780031AS, 780032AS, 780033AS, 780034AS, 78F0034BS

Home electric appliances, pagers, AV equipment, car audios, car electric equipment, office automation equipment, etc.

μPD780021AS(A), 780022AS(A), 780023AS(A), 780024AS(A)

μPD780031AS(A), 780032AS(A), 780033AS(A), 780034AS(A), 78F0034BS(A)

Control of transportation equipment, gas detection breakers, safety devices, etc.

## 1.3 Ordering Information

Part Number	Package	Internal ROM
μPD780021ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780022ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780023ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780024ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780031ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780032ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780033ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780034ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780021ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780022ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780023ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780024ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780031ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780032ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780033ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD780034ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Mask ROM
μPD78F0034BSGB-8ET	52-pin plastic LQFP (10 × 10)	Flash memory
μPD78F0034BSGB(A)-8ET	52-pin plastic LQFP (10 × 10)	Flash memory

**Remark** xxx indicates ROM code suffix.

## 1.4 Quality Grade

Part Number	Package	Quality Grades
$\mu$ PD780021ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD780022ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD780023ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD780024ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD780031ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD780032ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD780033ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD780034ASGB-xxx-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD78F0034BSGB-8ET	52-pin plastic LQFP (10 × 10)	Standard
$\mu$ PD780021ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Special
$\mu$ PD780022ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Special
$\mu$ PD780023ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Special
$\mu$ PD780024ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Special
$\mu$ PD780031ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Special
$\mu$ PD780032ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Special
$\mu$ PD780033ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Special
$\mu$ PD780034ASGB(A)-xxx-8ET	52-pin plastic LQFP (10 × 10)	Special
$\mu$ PD78F0034BSGB(A)-8ET	52-pin plastic LQFP (10 × 10)	Special

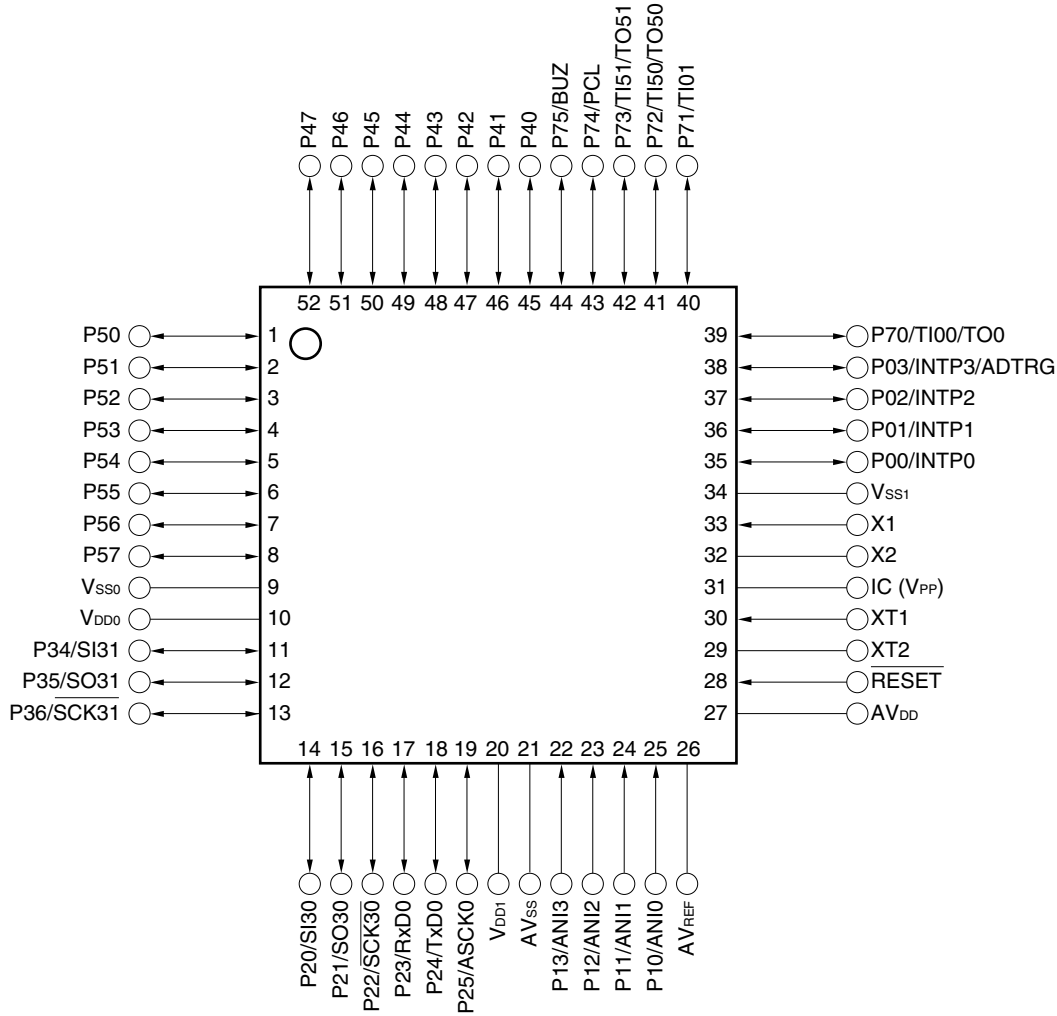

**Remark** xxx indicates ROM code suffix.

Please refer to "Quality Grades on NEC Semiconductor Devices" (Document No. C11531E) published by NEC Electronics Corporation to know the specification of the quality grade on the device and its recommended applications.

### 1.5 Pin Configuration (Top View)

• **52-pin plastic LQFP (10 × 10)**

μPD780021ASGB-xxx-8ET, 780022ASGB-xxx-8ET, 780023ASGB-xxx-8ET,  
 780024ASGB-xxx-8ET, 780031ASGB-xxx-8ET, 780032ASGB-xxx-8ET,  
 780033ASGB-xxx-8ET, 780034ASGB-xxx-8ET, 78F0034BSGB-8ET,  
 780021ASGB(A)-xxx-8ET, 780022ASGB(A)-xxx-8ET, 780023ASGB(A)-xxx-8ET,  
 780024ASGB(A)-xxx-8ET, 780031ASGB(A)-xxx-8ET, 780032ASGB(A)-xxx-8ET,  
 780033ASGB(A)-xxx-8ET, 780034ASGB(A)-xxx-8ET, 78F0034BSGB(A)-8ET

- Cautions**
1. Connect IC (Internally Connected) pin directly to V<sub>SS0</sub> or V<sub>SS1</sub>.
  2. Connect AV<sub>SS</sub> pin to V<sub>SS0</sub>.

- Remarks**
1. When these devices are used in applications that require the reduction of noise generated from an on-chip microcontroller, the implementation of noise measures is recommended, such as supplying V<sub>DD0</sub> and V<sub>DD1</sub> independently, connecting V<sub>SS0</sub> and V<sub>SS1</sub> independently to ground lines, and so on.
  2. Pin connection in parentheses is intended for the μPD78F0034BS and 78F0034BS(A).

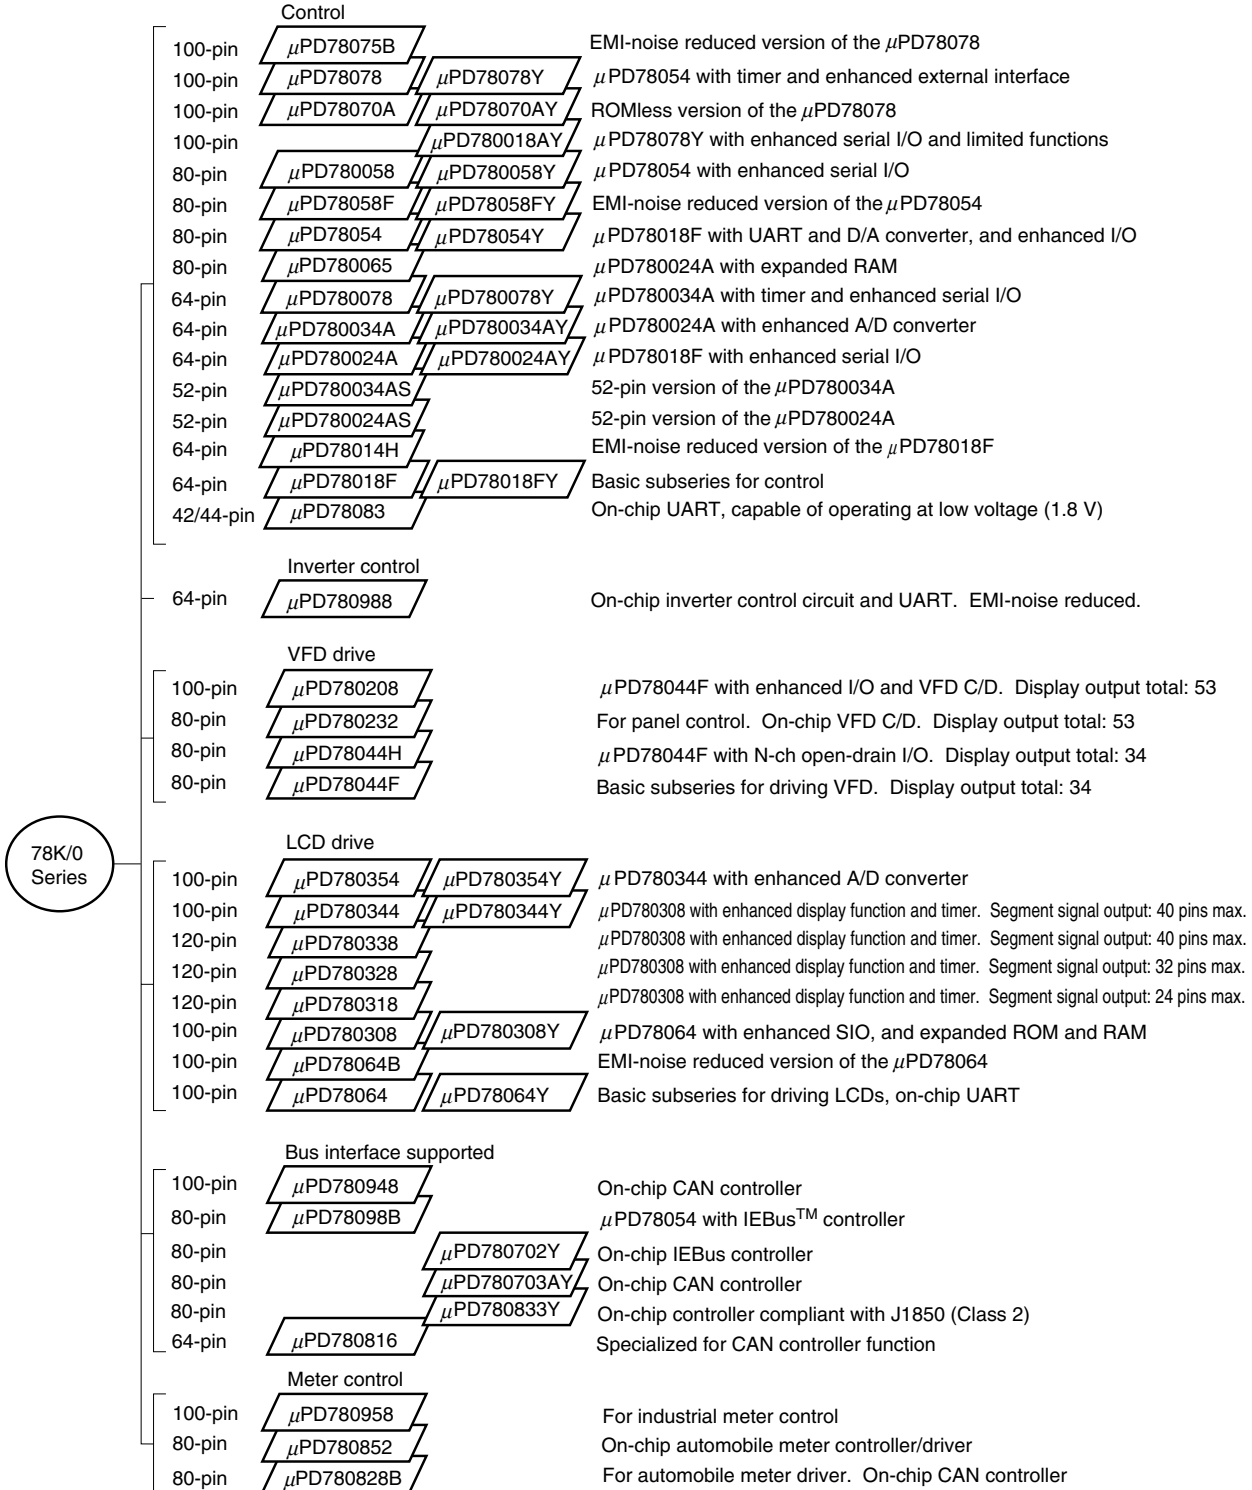

ADTRG:	AD trigger input	P70 to P75:	Port 7
ANI0 to ANI3:	Analog input	PCL:	Programmable clock
ASCK0:	Asynchronous serial clock	$\overline{\text{RESET}}$ :	Reset
AV <sub>DD</sub> :	Analog power supply	RxD0:	Receive data
AV <sub>REF</sub> :	Analog reference voltage	$\overline{\text{SCK30}}$ , $\overline{\text{SCK31}}$ :	Serial clock
AV <sub>SS</sub> :	Analog ground	SI30, SI31:	Serial input
BUZ:	Buzzer clock	SO30, SO31:	Serial output
IC:	Internally connected	TI00, TI01, TI50, TI51:	Timer input
INTP0 to INTP3:	External interrupt input	TO0, TO50, TO51:	Timer output
P00 to P03:	Port 0	TxD0:	Transmit data
P10 to P13:	Port 1	V <sub>DD0</sub> , V <sub>DD1</sub> :	Power supply
P20 to P25:	Port 2	V <sub>PP</sub> :	Programming power supply
P34 to P36:	Port 3	V <sub>SS0</sub> , V <sub>SS1</sub> :	Ground
P40 to P47:	Port 4	X1, X2:	Crystal (main system clock)
P50 to P57:	Port 5	XT1, XT2:	Crystal (subsystem clock)

★ 1.6 78K/0 Series Lineup

The 78K/0 Series product lineup is illustrated below. Part numbers in the boxes indicate subseries names.

Y subseries products are compatible with I<sup>2</sup>C bus.

**Remark** VFD (Vacuum Fluorescent Display) is referred to as FIP™ (Fluorescent Indicator Panel) in some documents, but the functions of the two are the same.

The major functional differences between the subseries are shown below.

• Subseries without the suffix Y

Subseries Name	Function	ROM Capacity	Timer				8-Bit A/D	10-Bit A/D	8-Bit D/A	Serial Interface	I/O	V <sub>DD</sub> MIN. Value	External Expansion										
			8-Bit	16-Bit	Watch	WDT																	
Control	μPD78075B	32 KB to 40 KB	4 ch	1 ch	1 ch	1 ch	8 ch	-	2 ch	3 ch (UART: 1 ch)	88	1.8 V	Yes										
	μPD78078	48 KB to 60 KB									61	2.7 V											
	μPD78070A	-	2 ch	1 ch	-	-	-	-	-	3 ch (time-division UART: 1 ch)	68	1.8 V	-										
	μPD780058	24 KB to 60 KB									69	2.7 V											
	μPD78058F	48 KB to 60 KB									2.0 V	-											
	μPD78054	16 KB to 60 KB									60			2.7 V									
	μPD780065	40 KB to 48 KB									2 ch	-		-	-	-	-	-	3 ch (UART: 2 ch)	52	1.8 V		
	μPD780078	48 KB to 60 KB																		51	-		
	μPD780034A	8 KB to 32 KB									1 ch	-		-	-	-	-	-	3 ch (UART: 1 ch)	39		-	
	μPD780024A																			8 ch	-		
	μPD780034AS	-									-	-		-	-	-	-	-	-	-	-		
	μPD780024AS																					4 ch	-
	μPD78014H																					8 ch	-
	μPD78018F	8 KB to 60 KB									-	-		-	-	-	-	-	-	-	-		
	μPD78083	8 KB to 16 KB																				1 ch (UART: 1 ch)	33
Inverter control	μPD780988	16 KB to 60 KB									3 ch	Note		-	1 ch	-	8 ch	-	3 ch (UART: 2 ch)	47	4.0 V	Yes	
VFD drive	μPD780208	32 KB to 60 KB	2 ch	1 ch	1 ch	1 ch	8 ch	-	-	2 ch	74	2.7 V	-										
	μPD780232	16 KB to 24 KB	3 ch	-	-	-	4 ch	-	-	-	40	4.5 V

	$\mu$ PD780833Y	60 KB									65	4.5 V	

**Remark** The functions of the subseries without the suffix Y and the subseries with the suffix Y are the same, except for the serial interface (if a subseries without the suffix Y is available).

1.7 Block Diagram

- Remarks**
1. The internal ROM and RAM capacities depend on the product.
  2. Pin connection in parentheses is intended for the  $\mu$ PD78F0034BS.

1.8 Outline of Function

Item		Part Number				
		$\mu$ PD780021AS $\mu$ PD780031AS	$\mu$ PD780022AS $\mu$ PD780032AS	$\mu$ PD780023AS $\mu$ PD780033AS	$\mu$ PD780024AS $\mu$ PD780034AS	$\mu$ PD78F0034BS
Internal memory	ROM	8 KB (Mask ROM)	16 KB (Mask ROM)	24 KB (Mask ROM)	32 KB (Mask ROM)	32 KB <sup>Note</sup> (Flash memory)
	High-speed RAM	512 bytes		1024 bytes		1024 bytes <sup>Note</sup>
Memory space		64 KB				
General-purpose register		8 bits $\times$ 32 registers (8 bits $\times$ 8 registers $\times$ 4 banks)				
Minimum instruction execution time		Minimum instruction execution time changeable function				
★	When main system clock selected	0.166 $\mu$ s/0.333 $\mu$ s/0.666 $\mu$ s/1.33 $\mu$ s/2.66 $\mu$ s (@ 12 MHz operation when $V_{DD} = 4.5$ to 5.5 V)

Operating ambient temperature		$T_A = -40$ to $+85^\circ\text{C}$				
Package		• 52-pin plastic LQFP (10 $\times$ 10)				

**Note** The capacities of internal flash memory and internal high-speed RAM can be changed by means of the memory size switching register (IMS).

The outline of the timer/event counter is as follows (for details, refer to **CHAPTER 6 16-BIT TIMER/EVENT COUNTER 0**, **CHAPTER 7 8-BIT TIMER/EVENT COUNTERS 50, 51**, **CHAPTER 8 WATCH TIMER**, and **CHAPTER 9 WATCHDOG TIMER**).

		16-Bit Timer/ Event Counter	8-Bit Timer/ Event Counter	Watch Timer	Watchdog Timer
Operation mode	Interval timer	1 channel	2 channels	1 channel <sup>Note 1</sup>	1 channel <sup>Note 2</sup>
	External event counter	√	√	–	–
Function	Timer output	√	√	–	–
	PPG output	√	–	–	–
	PWM output	–	√	–	–
	Pulse width measurement	√	–	–	–
	Square-wave output	√	√	–	–
	Interrupt request	√	√	√	√

- Notes**
1. The watch timer can perform both watch timer and interval timer functions at the same time.
  2. The watchdog timer can perform either the watchdog timer function or the interval timer function.

### 1.9 Difference Between Standard Grade and Special Grade

Standard grade:  $\mu$ PD780021AS, 780022AS, 780023AS, 780024AS  
 $\mu$ PD780031AS, 780032AS, 780033AS, 780034AS, 78F0034BS

Special grade:  $\mu$ PD780021AS(A), 780022AS(A), 780023AS(A), 780024AS(A)  
 $\mu$ PD780031AS(A), 780032AS(A), 780033AS(A), 780034AS(A), 78F0034BS(A)

The standard and the special grades differ only in the quality level.

## CHAPTER 2 PIN FUNCTION

### 2.1 Pin Function List

#### (1) Port pins

Pin Name	I/O	Function	After Reset	Alternate Function
P00	I/O	Port 0 4-bit I/O port Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	Input	INTP0
P01				INTP1
P02				INTP2
P03				INTP3/ADTRG
P10 to P13	Input	Port 1 4-bit input-only port.	Input	ANI0 to ANI3
P20	I/O	Port 2 6-bit I/O port Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	Input	SI30
P21				SO30
P22				SCK30
P23				RxD0
P24				TxD0
P25				ASCK0
P34	I/O	Port 3 3-bit I/O port Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	Input	SI31
P35				SO31
P36				SCK31
P40 to P47	I/O	Port 4 8-bit I/O port Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings. Interrupt request flag (KRIF) is set to 1 by falling edge detection.	Input	—
P50 to P57	I/O	Port 5 8-bit I/O port LEDs can be driven directly. Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	Input	—
P70	I/O	Port 7 6-bit I/O port Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	Input	TI00/TO0
P71				TI01
P72				TI50/TO50
P73				TI51/TO51
P74				PCL
P75				BUZ

(2) Non-port pins (1/2)

Pin Name	I/O	Function	After Reset	Alternate Function
INTP0	Input	External interrupt request input with specifiable valid edges (rising edge, falling edge, both rising and falling edges)	Input	P00
INTP1				P01
INTP2				P02
INTP3				P03/ADTRG
SI30	Input	Serial interface serial data input	Input	P20
SI31				P34
SO30	Output	Serial interface serial data output	Input	P21
SO31				P35
SCK30	I/O	Serial interface serial clock input/output	Input	P22
SCK31				P36
RxD0	Input	Asynchronous serial interface serial data input	Input	P23
TxD0	Output	Asynchronous serial interface serial data output	Input	P24
ASCK0	Input	Asynchronous serial interface serial clock input	Input	P25
TI00	Input	External count clock input to 16-bit timer/event counter 0 Capture trigger input to 16-bit timer/event counter 0 capture register (CR00, CR01)	Input	P70/TO0
TI01		Capture trigger input to 16-bit timer/event counter 0 capture register (CR00)		P71
TI50		External count clock input to 8-bit timer/event counter 50		P72/TO50
TI51		External count clock input to 8-bit timer/event counter 51		P73/TO51
TO0	Output	16-bit timer/event counter 0 output	Input	P70/TO0
TO50		8-bit timer/event counter 50 output (also used for 8-bit PWM output)	Input	P72/TO50
TO51		8-bit timer/event counter 51 output (also used for 8-bit PWM output)	Input	P73/TO51
PCL	Output	Clock output (for main system clock and subsystem clock trimming)	Input	P74
BUZ	Output	Buzzer output	Input	P75
ANI0 to ANI3	Input	A/D converter analog input	Input	P10 to P13
ADTRG	Input	A/D converter trigger signal input	Input	P03/INTP3
AV <sub>REF</sub>	Input	A/D converter reference voltage input	—	—
AV <sub>DD</sub>	—	A/D converter analog power supply. Connect to V <sub>DD0</sub> or V <sub>DD1</sub> .	—	—
AV <sub>SS</sub>	—	A/D converter ground potential. Connect to V <sub>SS0</sub> or V <sub>SS1</sub> .	—	—
RESET	Input	System reset input	Input	—
X1	Input	Crystal/ceramic connection for main system clock oscillation	—	—
X2	—		—	—
XT1	Input	Crystal connection for subsystem clock oscillation	—	—
XT2	—		—	—
V <sub>DD0</sub>	—	Positive power supply for ports	—	—
V <sub>DD1</sub>	—	Positive power supply other than ports	—	—

(2) Non-port pins (2/2)

Pin Name	I/O	Function	After Reset	Alternate Function
V <sub>SS0</sub>	—	Ground potential for ports	—	—
V <sub>SS1</sub>	—	Ground potential other than ports	—	—
IC	—	Internally connected. Connect directly to V <sub>SS0</sub> or V <sub>SS1</sub> .	—	—
V <sub>PP</sub>	—	High-voltage application for program write/verify.	—	—

## 2.2 Description of Pin Functions

### 2.2.1 P00 to P03 (Port 0)

These are 4-bit I/O ports. Besides serving as I/O ports, they function as an external interrupt input, and A/D converter external trigger input.

The following operating modes can be specified in 1-bit units.

#### (1) Port mode

These ports function as 4-bit I/O ports.

P00 to P03 can be specified as input or output ports in 1-bit units with port mode register 0 (PM0). On-chip pull-up resistors can be used by setting pull-up resistor option register 0 (PU0).

#### (2) Control mode

These ports function as an external interrupt request input, and A/D converter external trigger input.

##### (a) INTP0 to INTP3

INTP0 to INTP3 are external interrupt request input pins which can specify valid edges (rising edge, falling edge, and both rising and falling edges).

##### (b) ADTRG

A/D converter external trigger input pin.

**Caution** When P03 is used as an A/D converter external trigger input, specify the valid edge by bits 1, 2 (EGA00, EGA01) of A/D converter mode register (ADM0) and set interrupt mask flag (PMK3) to 1.

### 2.2.2 P10 to P13 (Port 1)

These are 4-bit input-only ports. Besides serving as input ports, they function as an A/D converter analog input. The following operating modes can be specified in 1-bit units.

#### (1) Port mode

These ports function as 4-bit input-only ports.

#### (2) Control mode

These ports function as A/D converter analog input pins (ANI0 to ANI3).

### 2.2.3 P20 to P25 (Port 2)

These are 6-bit I/O ports. Besides serving as I/O ports, they function as serial interface data I/O and clock I/O. The following operating modes can be specified in 1-bit units.

#### (1) Port mode

These ports function as 6-bit I/O ports. They can be specified as input or output ports in 1-bit units with port mode register 2 (PM2). On-chip pull-up resistors can be used by setting pull-up resistor option register 2 (PU2).

**(2) Control mode**

These ports function as serial interface data I/O and clock I/O.

**(a) SI30 and SO30**

Serial interface serial data I/O pins.

**(b)  $\overline{\text{SCK30}}$** 

Serial interface serial clock I/O pin.

**(c) RxD0 and TxD0**

Asynchronous serial interface serial data I/O pins.

**(d) ASCK0**

Asynchronous serial interface serial clock input pin.

**2.2.4 P34 to P36 (Port 3)**

These are 3-bit I/O ports. Besides serving as I/O ports, they function as serial interface data I/O and clock I/O. The following operating modes can be specified in 1-bit units.

**(1) Port mode**

These ports function as 3-bit I/O ports. They can be specified as input or output ports in 1-bit units with port mode register 3 (PM3). On-chip pull-up resistors can be used by setting pull-up resistor option register 3 (PU3).

**(2) Control mode**

These ports function as serial interface data I/O and clock I/O.

**(a) SI31 and SO31**

Serial interface serial data I/O pins.

**(b)  $\overline{\text{SCK31}}$** 

Serial interface serial clock I/O pin.

**2.2.5 P40 to P47 (Port 4)**

These are 8-bit I/O ports.

The interrupt request flag (KRIF) can be set to 1 by detecting a falling edge.

The following operating mode can be specified in 1-bit units.

**Caution** When using the falling edge detection interrupt (INTKR), be sure to set the memory expansion mode register (MEM) to 01H.

**(1) Port mode**

These ports function as 8-bit I/O ports. They can be specified as input or output ports in 1-bit units with port mode register 4 (PM4). On-chip pull-up resistors can be used by setting pull-up resistor option register 4 (PU4).

**2.2.6 P50 to P57 (Port 5)**

These are 8-bit I/O ports.

Port 5 can drive LEDs directly.

The following operating modes can be specified in 1-bit units.

**(1) Port mode**

These ports function as 8-bit I/O ports. They can be specified as input or output ports in 1-bit units with port mode register 5 (PM5). On-chip pull-up resistors can be used by setting pull-up resistor option register 5 (PU5).

**2.2.7 P70 to P75 (Port 7)**

These are 6-bit I/O ports. Besides serving as I/O ports, they function as a timer I/O, clock output, and buzzer output.

The following operating modes can be specified in 1-bit units.

**(1) Port mode**

Port 7 functions as a 6-bit I/O port. They can be specified as an input port or output port in 1-bit units with port mode register 7 (PM7). On-chip pull-up resistors can be used by setting pull-up resistor option register 7 (PU7).

P70 and P71 are also 16-bit timer/event counter capture trigger signal input pins with a valid edge input.

**(2) Control mode**

Port 7 functions as timer I/O, clock output, and buzzer output.

**(a) TI00**

External count clock input pin to 16-bit timer/event counter and capture trigger signal input pin to 16-bit timer/event counter capture register (CR01).

**(b) TI01**

Capture trigger signal input pin to 16-bit timer/event counter capture register (CR00).

**(c) TI50 and TI51**

External count clock input pins to 8-bit timer/event counter.

**(d) TO0, TO50, and TO51**

Timer output pins.

**(e) PCL**

Clock output pin.

**(f) BUZ**

Buzzer output pin.

**2.2.8 AV<sub>REF</sub>**

This is an A/D converter reference voltage input pin. When no A/D converter is used, connect this pin to the V<sub>SS0</sub> or V<sub>SS1</sub> pin.

**2.2.9 AV<sub>DD</sub>**

This is an analog power supply pin of A/D converter. Always use the same potential as that of the V<sub>DD0</sub> pin or V<sub>DD1</sub> pin even when no A/D converter is used.

**2.2.10 AV<sub>SS</sub>**

This is a ground potential pin of A/D converter. Always use the same potential as that of the V<sub>SS0</sub> pin or V<sub>SS1</sub> pin even when no A/D converter is used.

**2.2.11  $\overline{\text{RESET}}$**

This is a low-level active system reset input pin.

**2.2.12 X1 and X2**

Crystal/ceramic resonator connect pins for main system clock oscillation.

For external clock supply, input clock signal to X1 and its inverted signal to X2.

**2.2.13 XT1 and XT2**

Crystal resonator connect pins for subsystem clock oscillation.

For external clock supply, input the clock signal to XT1 and its inverted signal to XT2.

**2.2.14 V<sub>DD0</sub> and V<sub>DD1</sub>**

V<sub>DD0</sub> is a positive power supply port pin.

V<sub>DD1</sub> is a positive power supply pin other than port pin.

**2.2.15 V<sub>SS0</sub> and V<sub>SS1</sub>**

V<sub>SS0</sub> is a ground potential port pin.

V<sub>SS1</sub> is a ground potential pin other than port pin.

**2.2.16 V<sub>PP</sub> (flash memory versions only)**

High-voltage apply pin for flash memory programming mode setting and program write/verify.

★ Handle in either of the following ways.

- Independently connect a 10 kΩ pull-down resistor.
- Set the jumper on the board so that this pin is connected directly to the dedicated flash programmer in programming mode and directly to V<sub>SS0</sub> or V<sub>SS1</sub> in normal operation mode.

When there is a potential difference between the V<sub>PP</sub> pin and V<sub>SS0</sub> pin or V<sub>SS1</sub> pin because the wiring between the two pins is too long or external noise is input to the V<sub>PP</sub> pin, the user program may not operate normally.

**2.2.17 IC (mask ROM version only)**

The IC (Internally Connected) pin is provided to set the test mode to check the  $\mu$ PD780024AS, 780034AS Subseries at delivery. Connect it directly to the V<sub>SS0</sub> or V<sub>SS1</sub> pin with the shortest possible wire in the normal operating mode.

When a potential difference is produced between the IC pin and V<sub>SS0</sub> pin or V<sub>SS1</sub> pin, because the wiring between those two pins is too long or an external noise is input to the IC pin, the user's program may not operate normally.

- **Connect IC pins to V<sub>SS0</sub> pins or V<sub>SS1</sub> pins directly.**

2.3 Pin I/O Circuits and Recommended Connection of Unused Pins

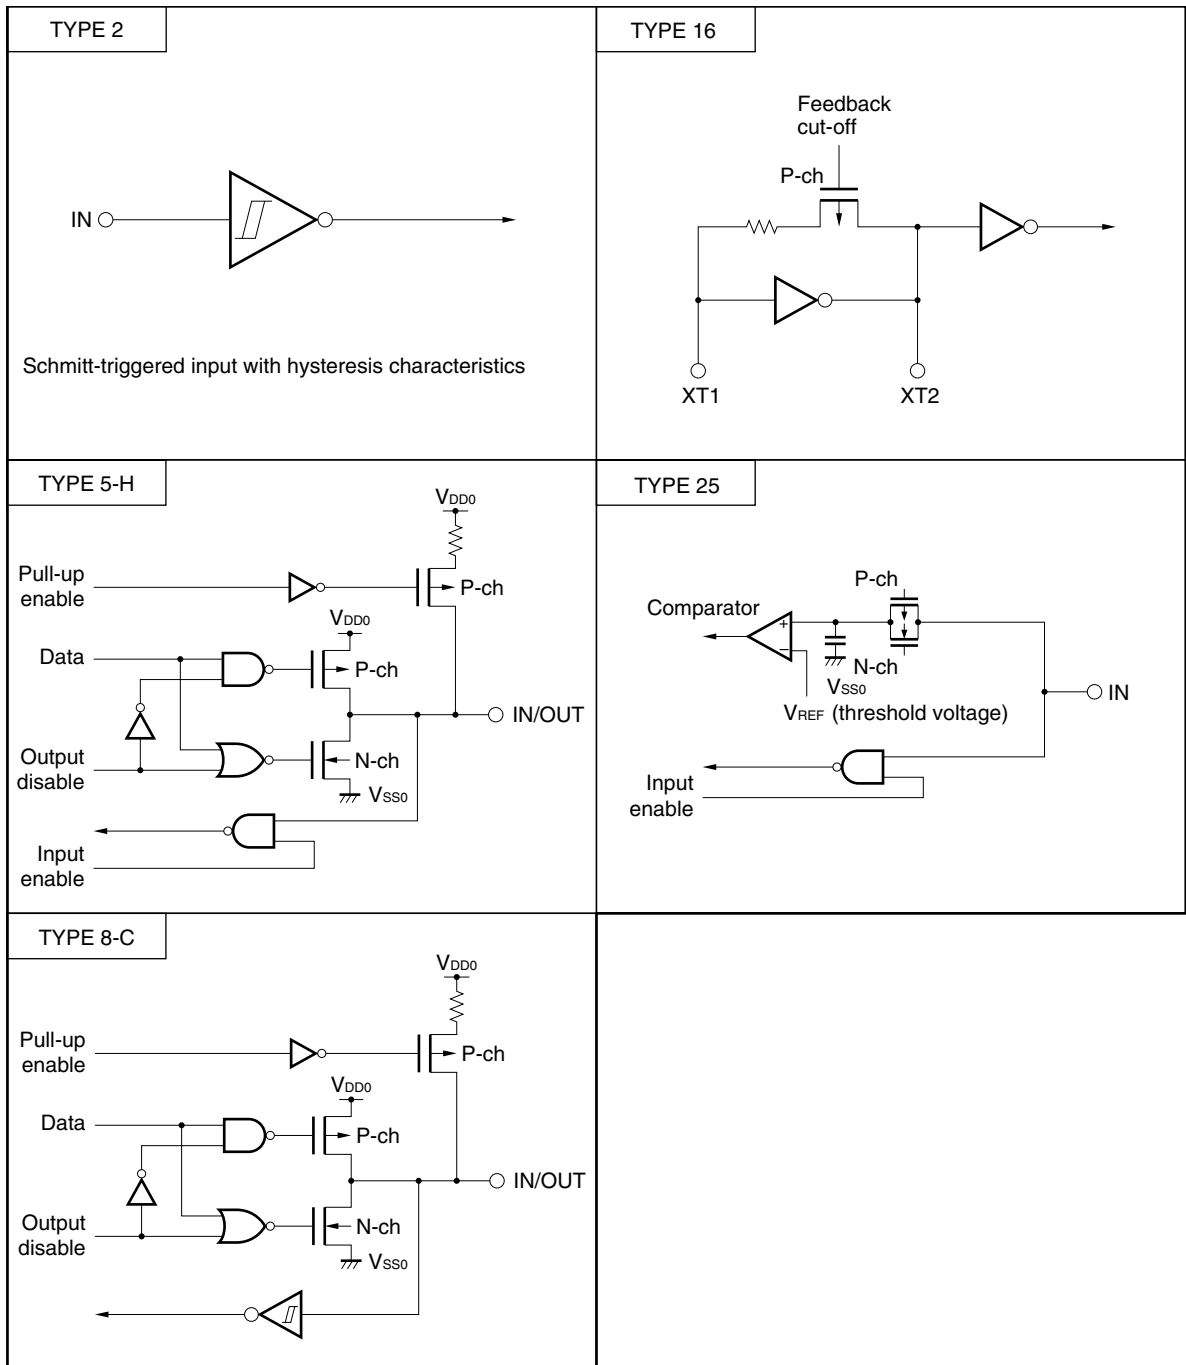

Table 2-1 shows the types of pin I/O circuit and the recommended connections of unused pins. Refer to **Figure 2-1** for the configuration of the I/O circuit of each type.

★

Table 2-1. Pin I/O Circuit Types

Pin Name	I/O Circuit Type	I/O	Recommended Connection of Unused Pins
P00/INTP0 to P02/INTP2	8-C	I/O	Input: Independently connect to V <sub>SS0</sub> or V <sub>SS1</sub> via a resistor.
P03/INTP3/ADTRG			Output: Leave open.
P10/ANI0 to P13/ANI3	25	Input	Connect directly to V <sub>DD0</sub> , V <sub>DD1</sub> , V <sub>SS0</sub> , or V <sub>SS1</sub> .
P20/SI30	8-C	I/O	Input: Independently connect to V <sub>DD0</sub> , V <sub>DD1</sub> , V <sub>SS0</sub> , or V <sub>SS1</sub> via a resistor. Output: Leave open.
P21/SO30	5-H		
P22/ $\overline{\text{SCK30}}$	8-C		
P23/RxD0			
P24/TxD0	5-H		
P25/ASCK0	8-C		
P34/SI31	8-C		Input: Independently connect to V <sub>DD0</sub> , V <sub>DD1</sub> , V <sub>SS0</sub> , or V <sub>SS1</sub> via a resistor. Output: Leave open.
P35/SO31	5-H		
P36/ $\overline{\text{SCK31}}$	8-C		
P40 to P47	5-H		I/O
P50 to P57	5-H	Input: Independently connect to V <sub>DD0</sub> , V <sub>DD1</sub> , V <sub>SS0</sub> , or V <sub>SS1</sub> via a resistor. Output: Leave open.	
P70/TI00/TO0	8-C		
P71/TI01			
P72/TI50/TO50			
P73/TI51/TO51			
P74/PCL			
P75/BUZ			
$\overline{\text{RESET}}$	2	Input	–
XT1	16	–	Connect directly to V <sub>DD0</sub> or V <sub>DD1</sub> .
XT2			Leave open.
AV <sub>DD</sub>	–	–	Connect directly to V <sub>DD0</sub> or V <sub>DD1</sub> .
AV <sub>REF</sub>			Connect directly to V <sub>SS0</sub> or V <sub>SS1</sub> .
AV <sub>SS</sub>			
IC (for mask ROM version)			
V <sub>PP</sub>			
(for flash memory version)			Independently connect a 10 k $\Omega$ pull-down resistor to this pin, or connect directly to V <sub>SS0</sub> or V <sub>SS1</sub> .

Figure 2-1. Pin I/O Circuit List

## CHAPTER 3 CPU ARCHITECTURE

### 3.1 Memory Spaces

$\mu$ PD780024AS, 780034AS Subseries can access 64 KB memory space respectively.  
 Figures 3-1 to 3-5 show memory maps.

**Caution** In case of the internal memory capacity, the initial value of memory size switching register (IMS) of all products ( $\mu$ PD780024AS, 780034AS Subseries) is fixed (IMS = CFH). Therefore, set the value corresponding to each product indicated below.

- $\mu$ PD780021AS, 780031AS: 42H
- $\mu$ PD780022AS, 780032AS: 44H
- $\mu$ PD780023AS, 780033AS: C6H
- $\mu$ PD780024AS, 780034AS: C8H
- $\mu$ PD78F0034BS: Value for mask ROM version

**Figure 3-1. Memory Map ( $\mu$ PD780021AS, 780031AS)**

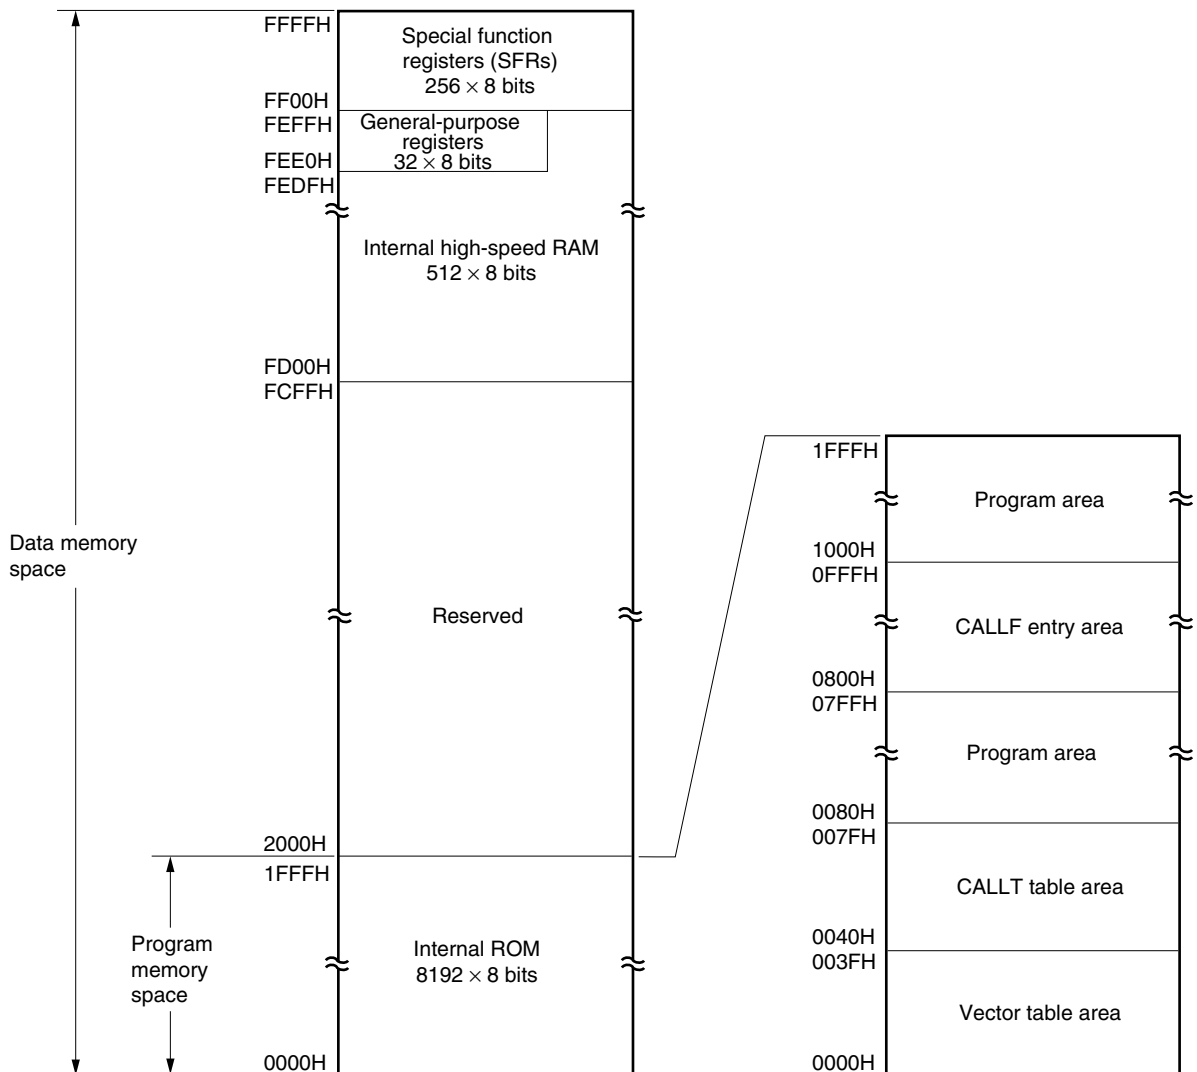

Figure 3-2. Memory Map ( $\mu$ PD780022AS, 780032AS)

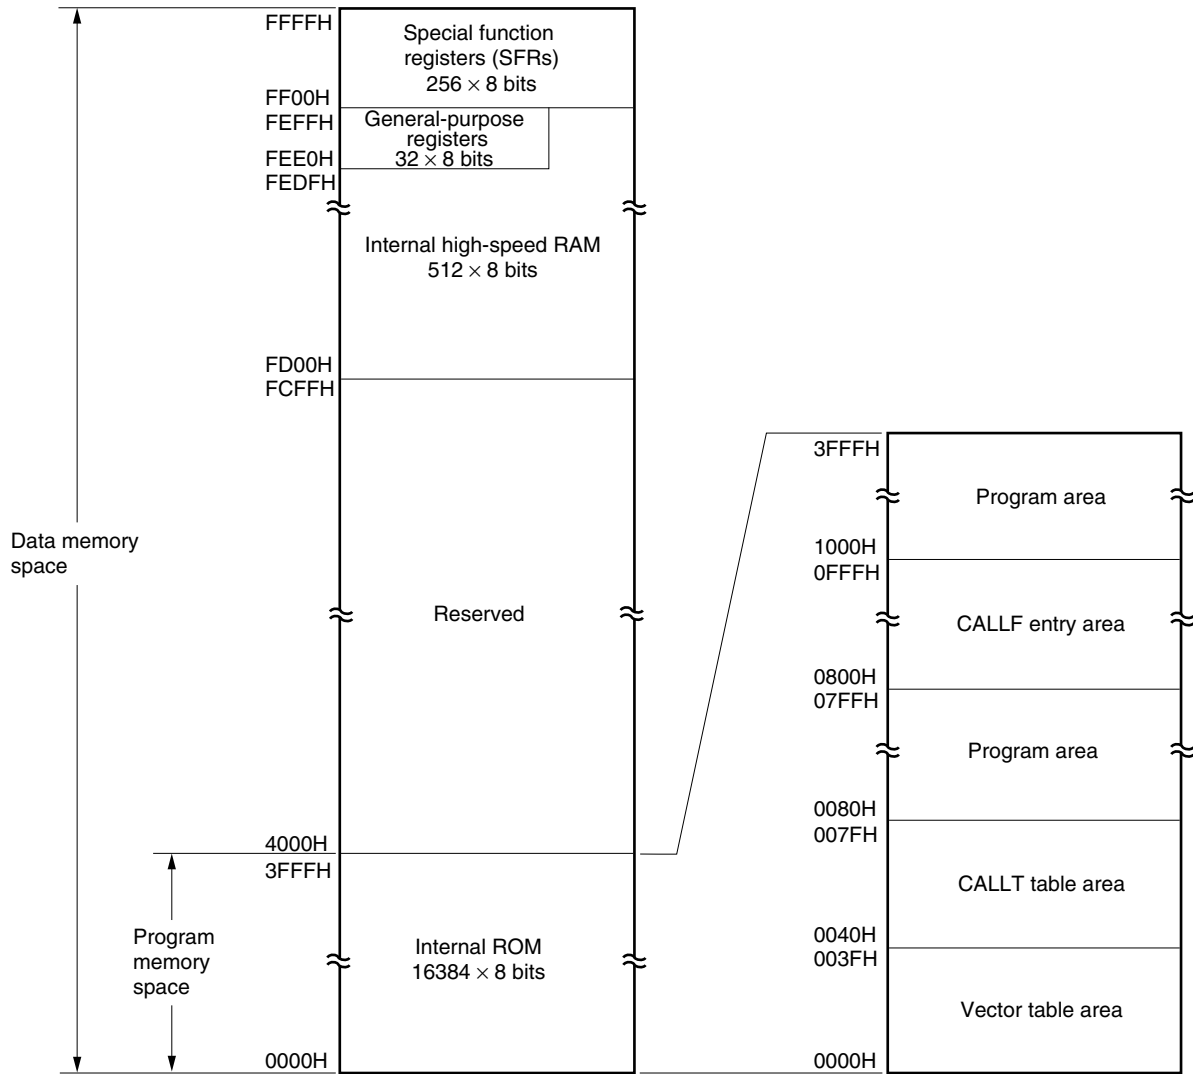

Figure 3-3. Memory Map ( $\mu$ PD780023AS, 780033AS)

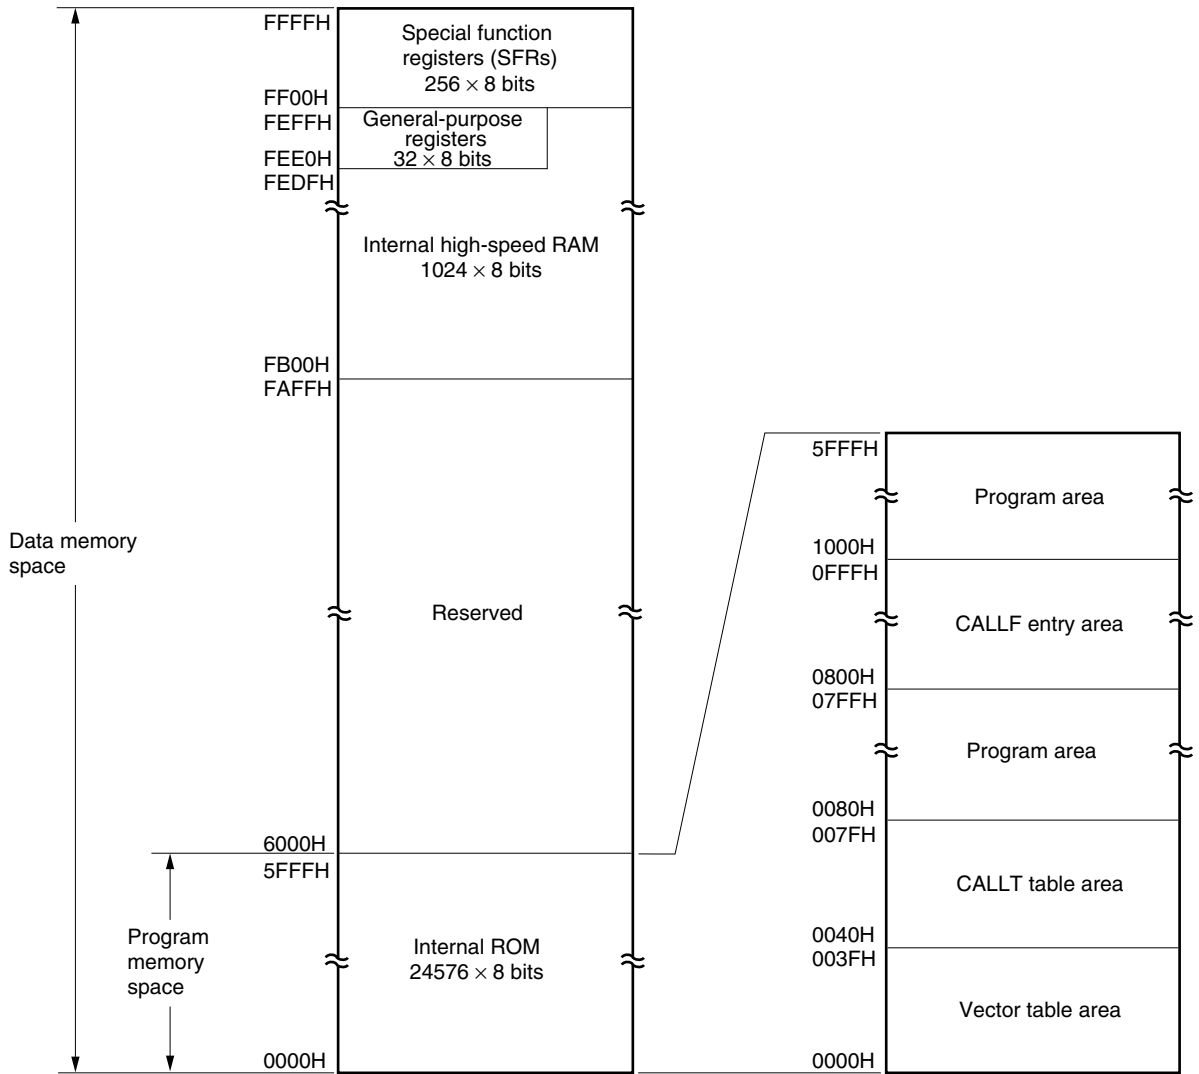

Figure 3-4. Memory Map ( $\mu$ PD780024AS, 780034AS)

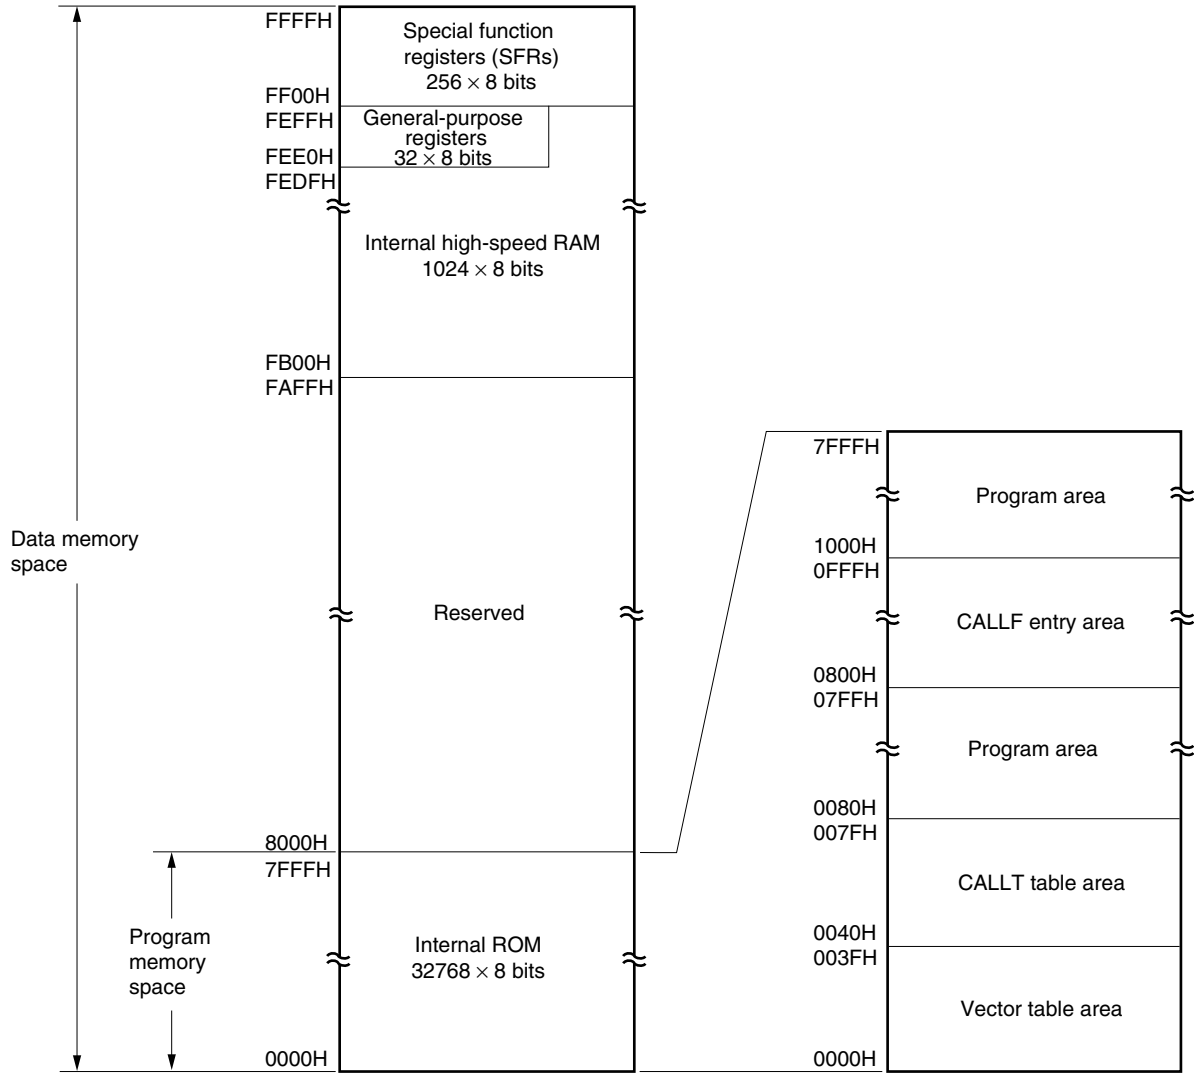

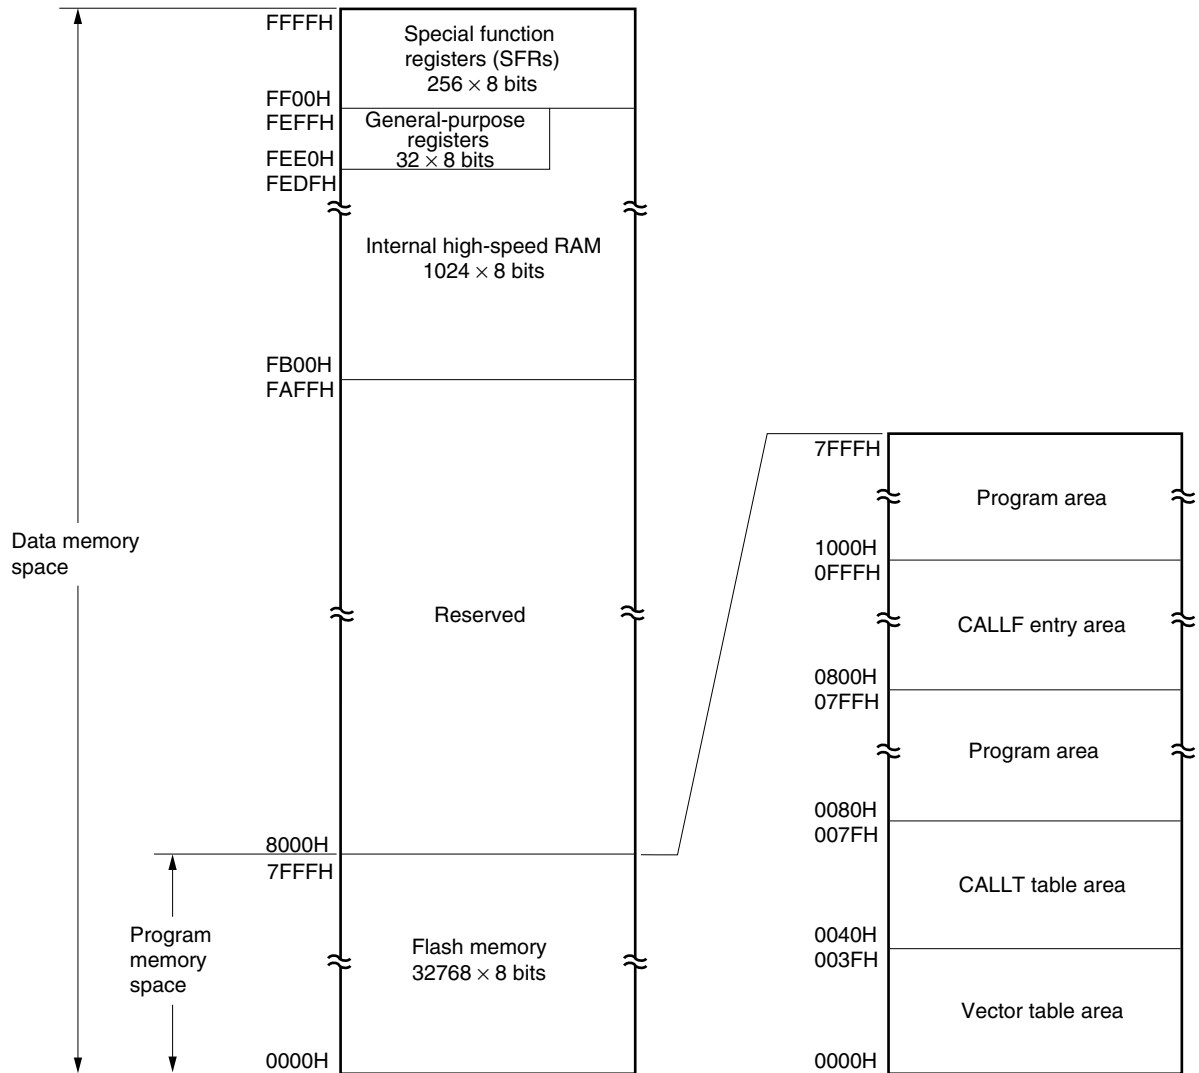

Figure 3-5. Memory Map ( $\mu$ PD78F0034BS)

### 3.1.1 Internal program memory space

The internal program memory space contains the program and table data. Normally, it is addressed with the program counter (PC).

The  $\mu$ PD780024AS, 780034AS Subseries products incorporate an on-chip ROM (mask ROM or flash memory), as listed below.

**Table 3-1. Internal ROM Capacity**

Part Number	Type	Capacity
$\mu$ PD780021AS, 780031AS	Mask ROM	8192 $\times$ 8 bits (0000H to 1FFFH)
$\mu$ PD780022AS, 780032AS		16384 $\times$ 8 bits (0000H to 3FFFH)
$\mu$ PD780023AS, 780033AS		24576 $\times$ 8 bits (0000H to 5FFFH)
$\mu$ PD780024AS, 780034AS		32768 $\times$ 8 bits (0000H to 7FFFH)
$\mu$ PD78F0034BS	Flash memory	32768 $\times$ 8 bits (0000H to 7FFFH)

The internal program memory space is divided into the following three areas.

#### (1) Vector table area

The 64-byte area 0000H to 003FH is reserved as a vector table area. The  $\overline{\text{RESET}}$  input and program start addresses for branch upon generation of each interrupt request are stored in the vector table area. Of the 16-bit address, lower 8 bits are stored at even addresses and higher 8 bits are stored at odd addresses.

**Table 3-2. Vector Table**

Vector Table Address	Interrupt Source	Vector Table Address	Interrupt Source
0000H	$\overline{\text{RESET}}$ input	0016H	INTCSI31
0004H	INTWDT	001AH	INTWTI
0006H	INTP0	001CH	INTTM00
0008H	INTP1	001EH	INTTM01
000AH	INTP2	0020H	INTTM50
000CH	INTP3	0022H	INTTM51
000EH	INTSER0	0024H	INTAD0
0010H	INTSR0	0026H	INTWT
0012H	INTST0	0028H	INTKR
0014H	INTCSI30	003EH	BRK

#### (2) CALLT instruction table area

The 64-byte area 0040H to 007FH can store the subroutine entry address of a 1-byte call instruction (CALLT).

#### (3) CALLF instruction entry area

The area 0800H to 0FFFH can perform a direct subroutine call with a 2-byte call instruction (CALLF).

### 3.1.2 Internal data memory space

The  $\mu$ PD780024AS, 780034AS Subseries products incorporate an internal high-speed RAM, as listed below.

**Table 3-3. Internal High-Speed RAM Capacity**

Part Number	Internal High-Speed RAM
$\mu$ PD780021AS, 780031AS	512 $\times$ 8 bits (FD00H to FEFFH)
$\mu$ PD780022AS, 780032AS	
$\mu$ PD780023AS, 780033AS	1024 $\times$ 8 bits (FB00H to FEFFH)
$\mu$ PD780024AS, 780034AS	
$\mu$ PD78F0034BS	

The 32-byte area FEE0H to FEFFH is allocated four general-purpose register banks composed of eight 8-bit registers.

★

This area cannot be used as a program area in which instructions are written and executed.

The internal high-speed RAM can also be used as a stack memory.

### 3.1.3 Special function register (SFR) area

An on-chip peripheral hardware special function register (SFR) is allocated in the area FF00H to FFFFH (refer to

**3.2.3 Special function register (SFR) Table 3-5 Special Function Register List**).

**Caution Do not access addresses where the SFR is not assigned.**

### 3.1.4 External memory space

The external memory space is accessible with memory expansion mode register (MEM). External memory space can store program, table data, etc., and allocate peripheral devices.

3.1.5 Data memory addressing

Addressing refers to the method of specifying the address of the instruction to be executed next or the address of the register or memory relevant to the execution of instructions.

Several addressing modes are provided for addressing the memory relevant to the execution of instructions for the  $\mu$ PD780024AS, 780034AS Subseries, based on operability and other considerations. For areas containing data memory in particular, special addressing methods designed for the functions of special function registers (SFR) and general-purpose registers are available for use. Correspondence between data memory and addressing is illustrated in Figures 3-6 to 3-10. For the details of each addressing mode, see 3.4 Operand Address Addressing.

Figure 3-6. Correspondence Between Data Memory and Addressing ( $\mu$ PD780021AS, 780031AS)

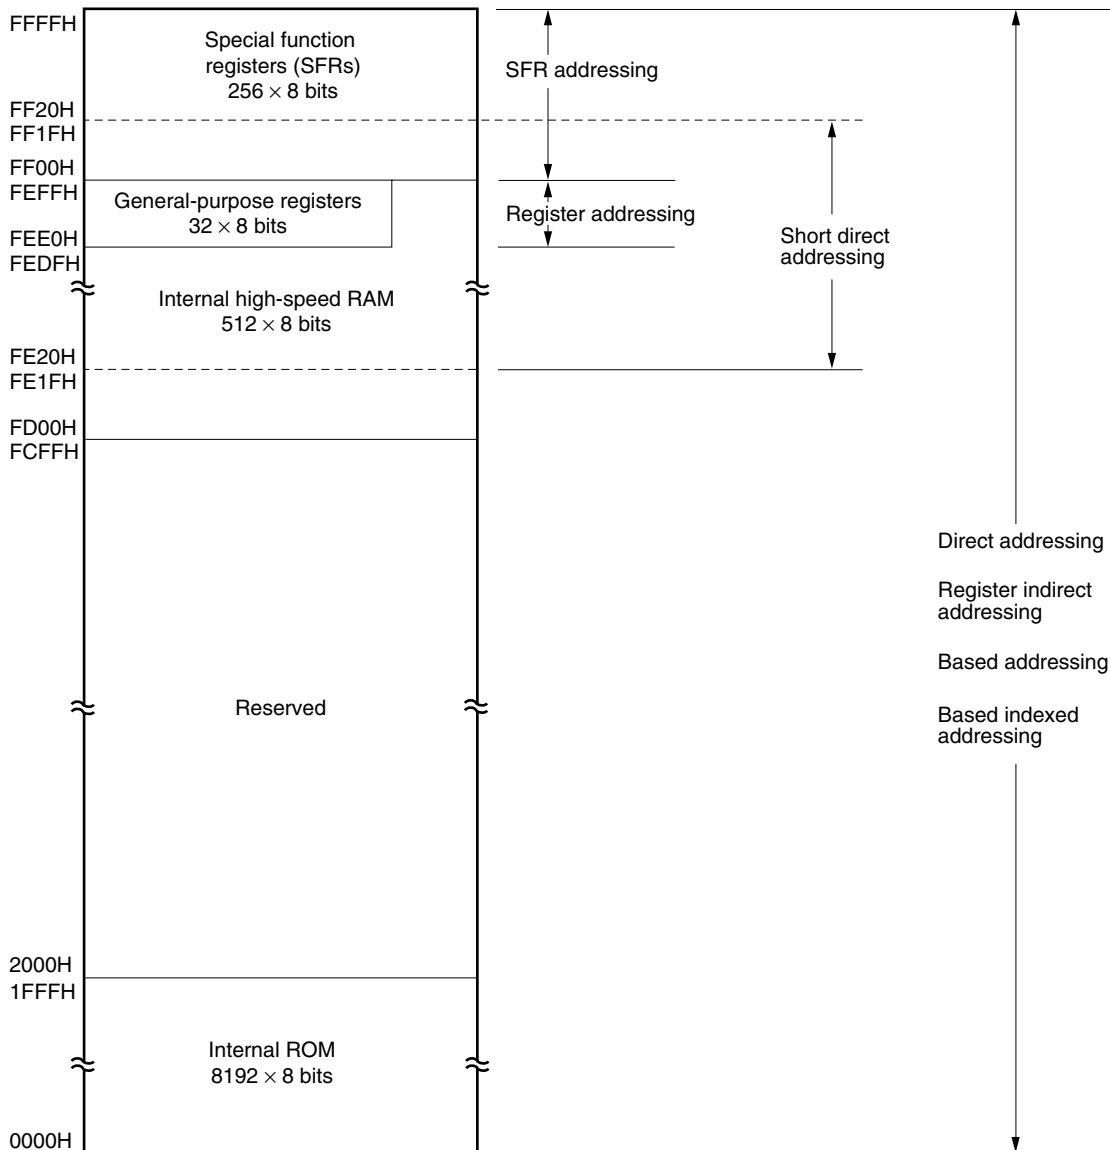

Figure 3-7. Correspondence Between Data Memory and Addressing ( $\mu$ PD780022AS, 780032AS)

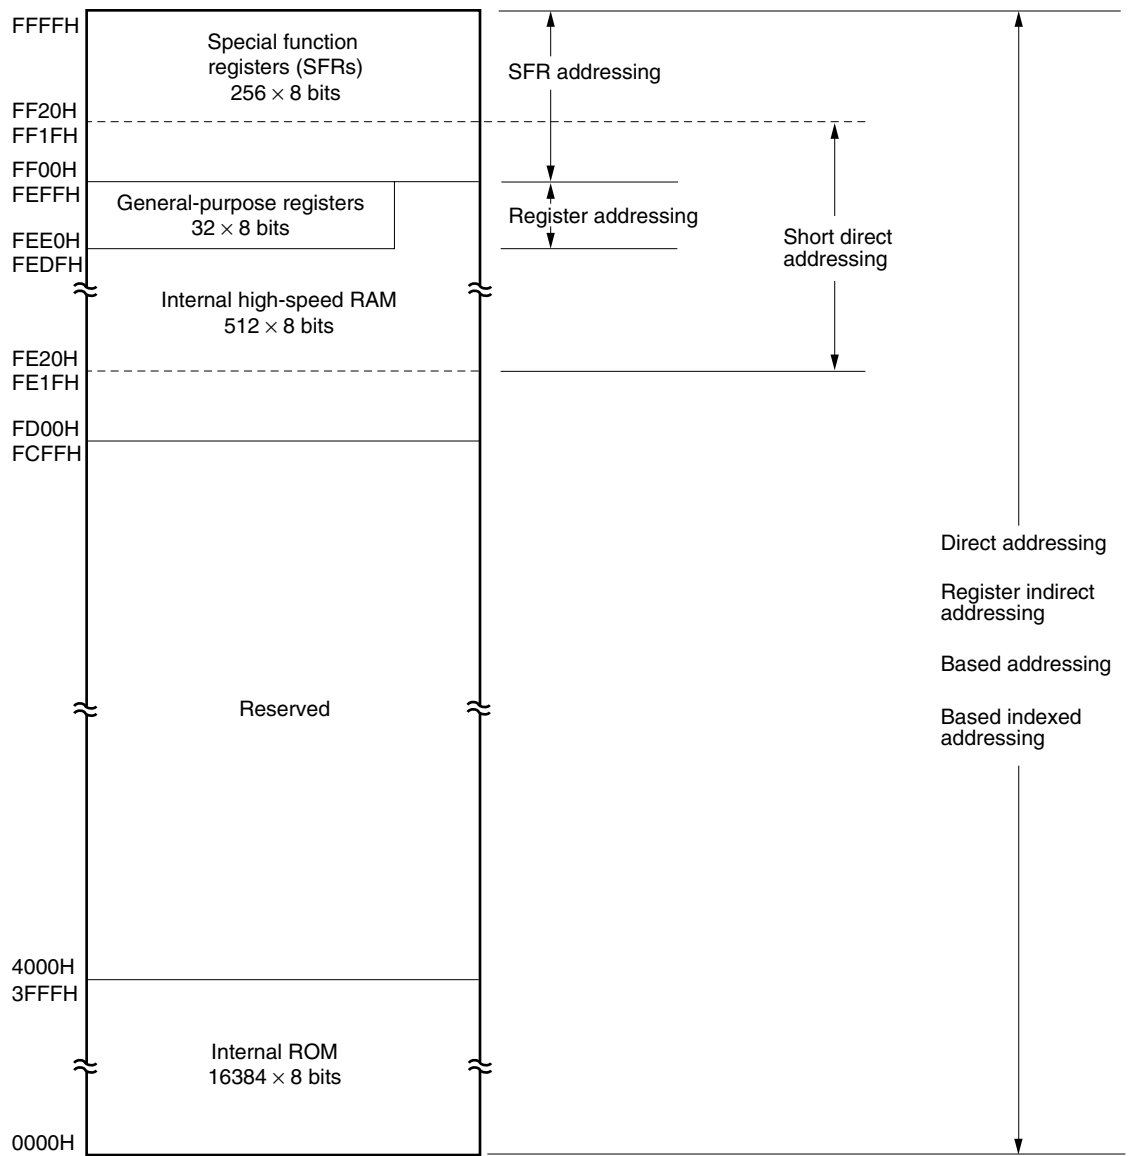

Figure 3-8. Correspondence Between Data Memory and Addressing ( $\mu$ PD780023AS, 780033AS)

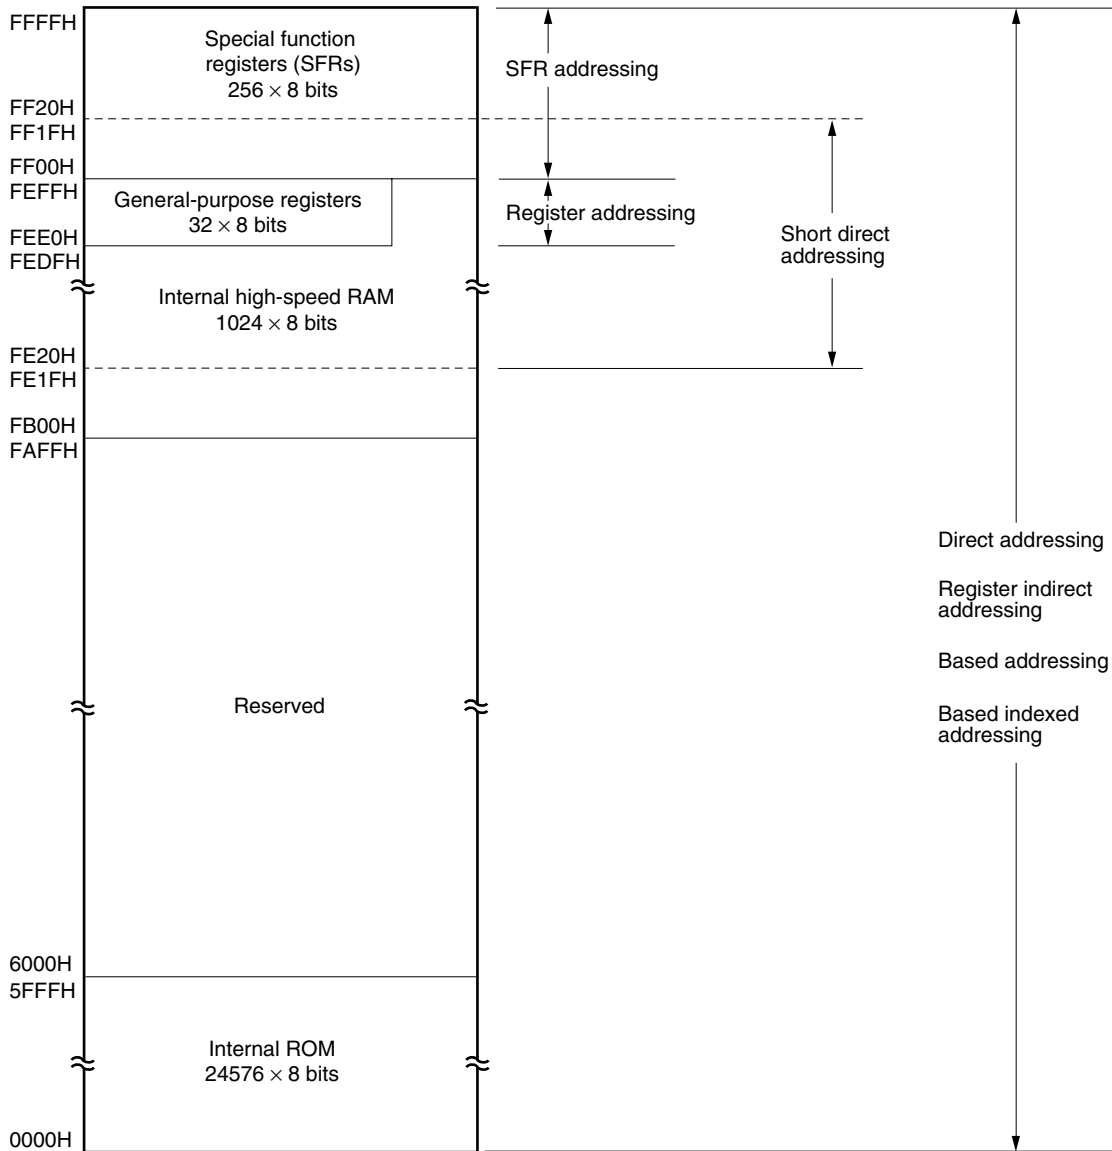

Figure 3-9. Correspondence Between Data Memory and Addressing ( $\mu$ PD780024AS, 780034AS)

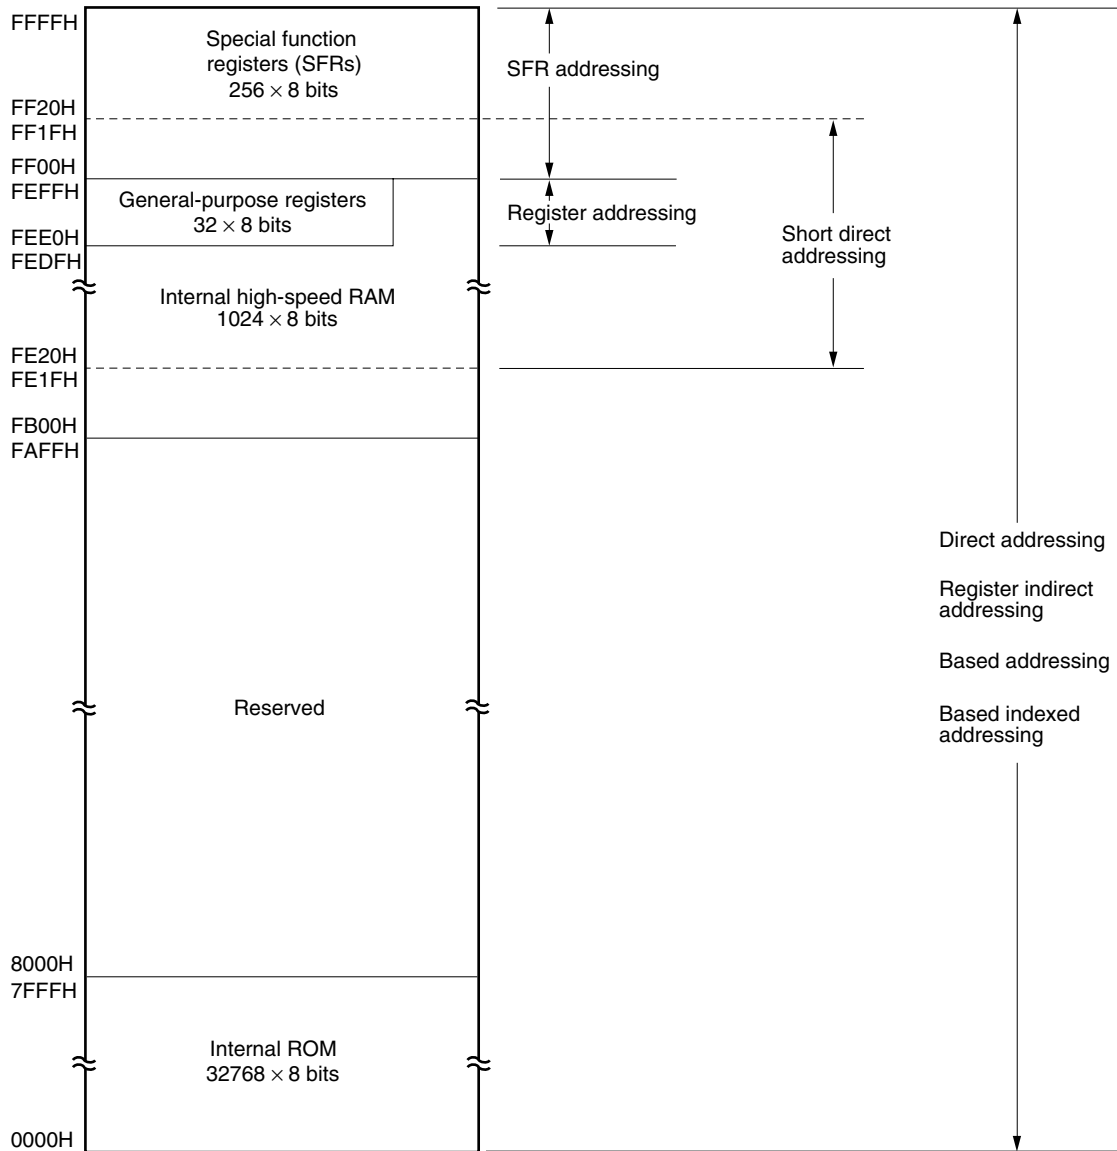

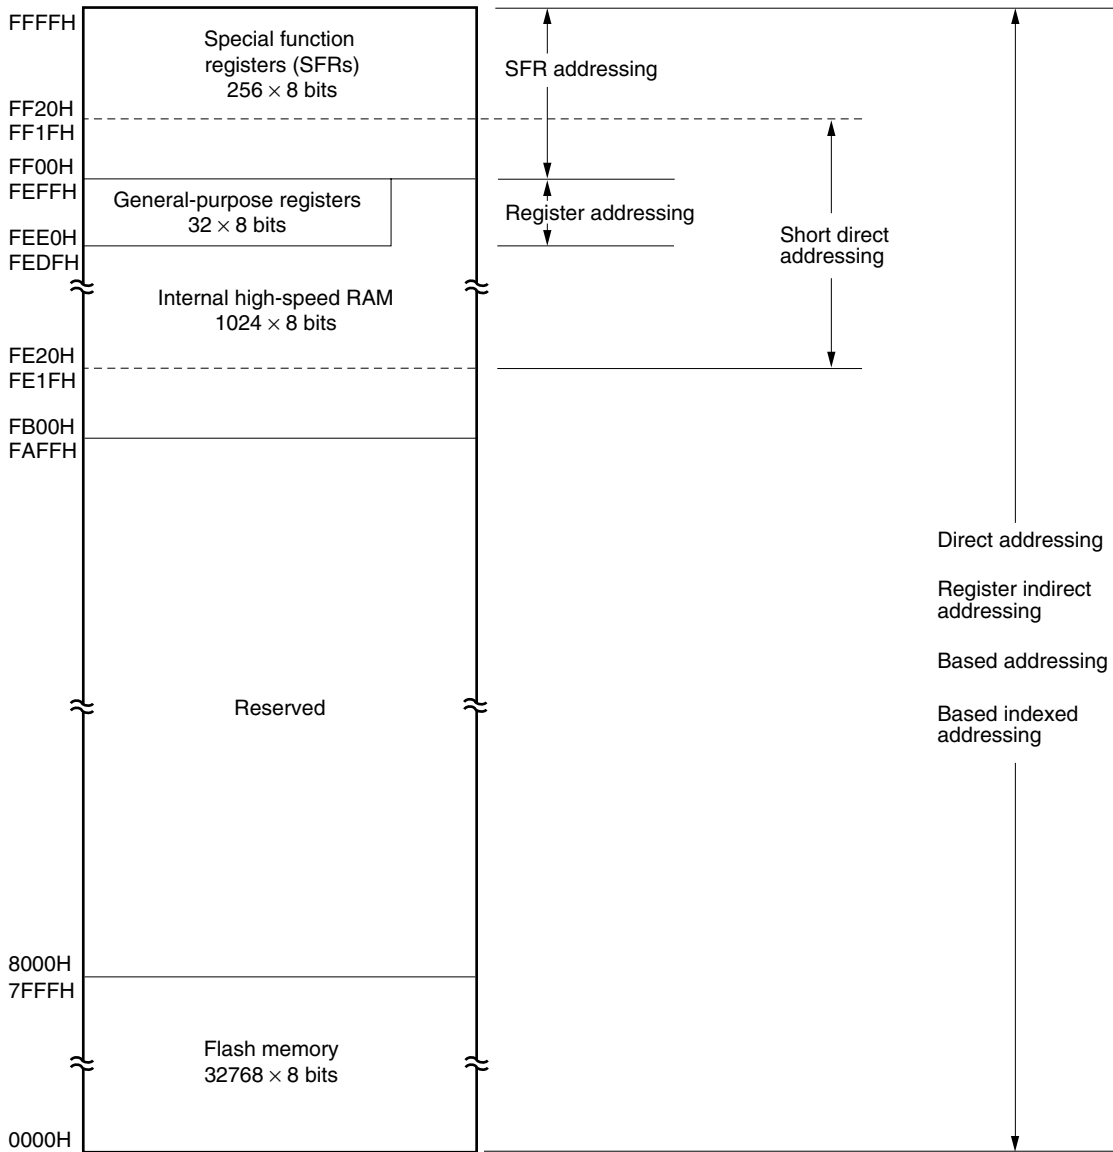

Figure 3-10. Correspondence Between Data Memory and Addressing ( $\mu$ PD78F0034BS)

**(d) Auxiliary carry flag (AC)**

If the operation result has a carry from bit 3 or a borrow at bit 3, this flag is set (1). It is reset (0) in all other cases.

**(e) In-service priority flag (ISP)**

This flag manages the priority of acknowledgeable maskable vectored interrupts. When this flag is 0, low-level vectored interrupt requests specified with a priority specification flag register (PR0L, PR0H, PR1L) (refer to **15.3 (3) Priority specification flag registers (PR0L, PR0H, PR1L)**) are disabled for acknowledgement. When it is 1, all interrupts are acknowledgeable. Actual request acknowledgement is controlled with the interrupt enable flag (IE).

**(f) Carry flag (CY)**

This flag stores overflow and underflow upon add/subtract instruction execution. It stores the shift-out value upon rotate instruction execution and functions as a bit accumulator during bit manipulation instruction execution.

**(3) Stack pointer (SP)**

This is a 16-bit register to hold the start address of the memory stack area. Only the internal high-speed RAM area can be set as the stack area. The internal high-speed RAM areas of each product are as follows.

**Table 3-4. Internal High-Speed RAM Area**

Part Number	Internal High-Speed RAM Area
μPD780021AS, 780022AS, 780031AS, 780032AS	FD00H to FEFFH
μPD780023AS, 780024AS, 780033AS, 780034AS, 78F0034BS	FB00H to FEFFH

**Figure 3-13. Format of Stack Pointer**

The SP is decremented ahead of write (save) to the stack memory and is incremented after read (reset) from the stack memory.

Each stack operation saves/resets data as shown in Figures 3-14 and 3-15.

**Caution** Since RESET input makes SP contents undefined, be sure to initialize the SP before using the stack.

★

Figure 3-14. Data to Be Saved to Stack Memory

(b) RET instruction (when SP is FEDEH)

(c) RETI, RETB instructions (when SP is FEDDH)

**3.2.2 General-purpose registers**

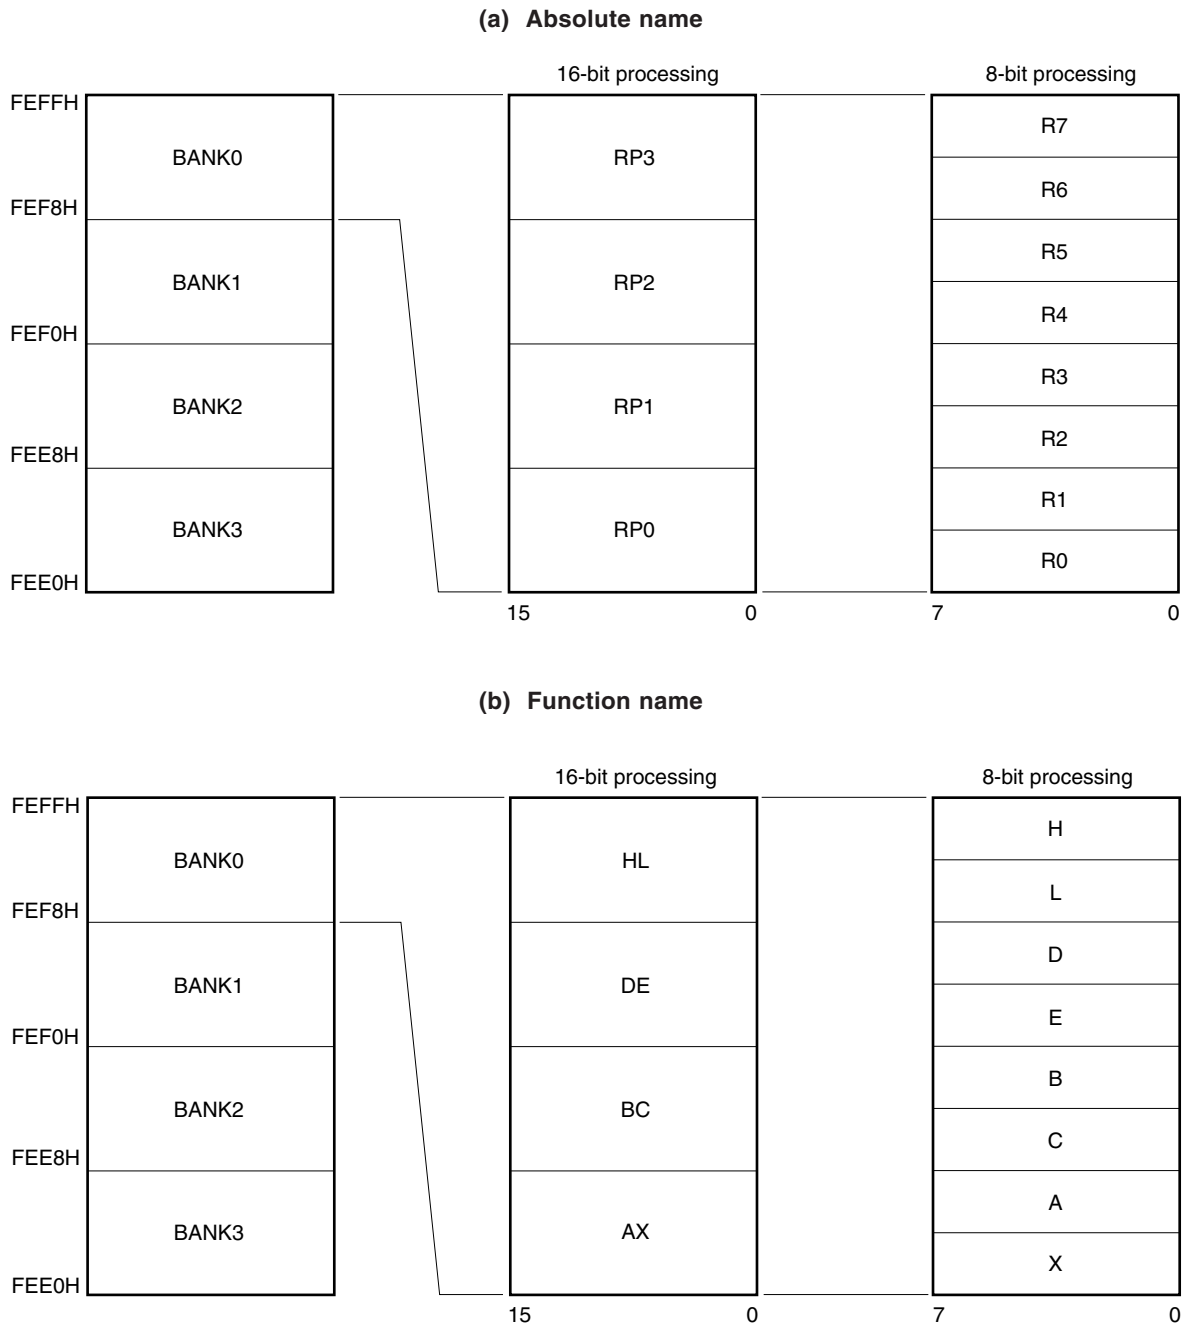

A general-purpose register is mapped at particular addresses (FEE0H to FEFFH) of the data memory. It consists of 4 banks, each bank consisting of eight 8-bit registers (X, A, C, B, E, D, L, and H).

Each register can also be used as an 8-bit register. Two 8-bit registers can be used in pairs as a 16-bit register (AX, BC, DE, and HL).

They can be described in terms of function names (X, A, C, B, E, D, L, H, AX, BC, DE, and HL) and absolute names (R0 to R7 and RP0 to RP3).

Register banks to be used for instruction execution are set with the CPU control instruction (SEL RBn). Because of the 4-register bank configuration, an efficient program can be created by switching between a register for normal processing and a register for interrupts for each bank.

**Figure 3-16. Configuration of General-Purpose Register**

### 3.2.3 Special function register (SFR)

Unlike a general-purpose register, each special function register has special functions.

It is allocated in the FF00H to FFFFH area.

The special function register can be manipulated like the general-purpose register, with the operation, transfer and bit manipulation instructions. Manipulatable bit units, 1, 8, and 16, depend on the special function register type.

Each manipulation bit unit can be specified as follows.

- 1-bit manipulation  
Describe the symbol reserved with assembler for the 1-bit manipulation instruction operand (sfr.bit).  
This manipulation can also be specified with an address.
- 8-bit manipulation  
Describe the symbol reserved with assembler for the 8-bit manipulation instruction operand (sfr).  
This manipulation can also be specified with an address.
- 16-bit manipulation  
Describe the symbol reserved with assembler for the 16-bit manipulation instruction operand (sfrp).  
When addressing an address, describe an even address.

Table 3-5 gives a list of special function registers. The meaning of items in the table is as follows.

- Symbol  
Symbol indicating the address of a special function register. It is a reserved word in the RA78K0, and is defined via the header file "sfrbit.h" in the CC78K0. When using the RA78K0, ID78K0-NS, ID78K0, or SM78K0, symbols can be written as an instruction operand.
- R/W  
Indicates whether the corresponding special function register can be read or written.  
R/W: Read/write enable  
R: Read only  
W: Write only
- Manipulatable bit units  
Indicates the manipulatable bit unit (1, 8, or 16). "-" indicates a bit unit for which manipulation is not possible.
- After reset  
Indicates each register status upon  $\overline{\text{RESET}}$  input.

Table 3-5. Special Function Register List (1/2)

Address	Special Function Register (SFR) Name	Symbol		R/W	Manipulatable Bit Unit			After Reset
					1 Bit	8 Bits	16 Bits

**Note** The default is CFH, but set the value corresponding to each respective product as indicated below.

- μPD780021AS, 780031AS: 42H
- μPD780022AS, 780032AS: 44H
- μPD780023AS, 780033AS: C6H
- μPD780024AS, 780034AS: C8H
- μPD78F0034BS: Value for mask ROM version

### 3.3 Instruction Address Addressing

An instruction address is determined by program counter (PC) contents and is normally incremented (+1 for each byte) automatically according to the number of bytes of an instruction to be fetched each time another instruction is executed. When a branch instruction is executed, the branch destination information is set to the PC and branched by the following addressing (for details of instructions, refer to **78K/0 Series Instructions User's Manual (U12326E)**).

#### 3.3.1 Relative addressing

##### [Function]

The value obtained by adding 8-bit immediate data (displacement value:  $jdisp8$ ) of an instruction code to the start address of the following instruction is transferred to the program counter (PC) and branched. The displacement value is treated as signed two's complement data ( $-128$  to  $+127$ ) and bit 7 becomes a sign bit. In other words, relative addressing consists in relative branching from the start address of the following instruction to the  $-128$  to  $+127$  range.

This function is carried out when the BR \$addr16 instruction or a conditional branch instruction is executed.

##### [Illustration]

When  $S = 0$ , all bits of  $\alpha$  are 0.  
 When  $S = 1$ , all bits of  $\alpha$  are 1.

3.3.2 Immediate addressing

[Function]

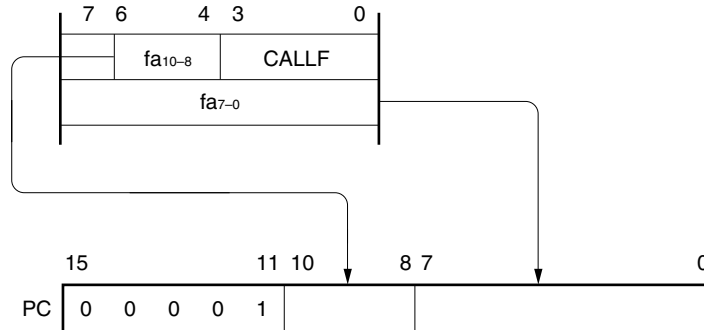

Immediate data in the instruction word is transferred to the program counter (PC) and branched. This function is carried out when the CALL !addr16 or BR !addr16 or CALLF !addr11 instruction is executed. CALL !addr16 and BR !addr16 instructions can be branched to the entire memory space. The CALLF !addr11 instruction is branched to the 0800H to 0FFFH area.

[Illustration]

In the case of CALL !addr16 and BR !addr16 instructions

In the case of CALLF !addr11 instruction

3.3.3 Table indirect addressing

[Function]

Table contents (branch destination address) of the particular location to be addressed by bits 1 to 5 of the immediate data of an operation code are transferred to the program counter (PC) and branched.

This function is carried out when the CALLT [addr5] instruction is executed.

This instruction references the address stored in the memory table from 40H to 7FH, and allows branching to the entire memory space.

[Illustration]

3.3.4 Register addressing

[Function]

Register pair (AX) contents to be specified with an instruction word are transferred to the program counter (PC) and branched.

This function is carried out when the BR AX instruction is executed.

[Illustration]

### 3.4 Operand Address Addressing

The following various methods are available to specify the register and memory (addressing) which undergo manipulation during instruction execution.

#### 3.4.1 Implied addressing

##### [Function]

The register which functions as an accumulator (A and AX) in the general-purpose register is automatically (implicitly) addressed.

Of the  $\mu$ PD780024AS, 780034AS Subseries instruction words, the following instructions employ implied addressing.

Instruction	Register to Be Specified by Implied Addressing
MULU	A register for multiplicand and AX register for product storage
DIVUW	AX register for dividend and quotient storage
ADJBA/ADJBS	A register for storage of numeric values which become decimal correction targets
ROR4/ROL4	A register for storage of digit data which undergoes digit rotation

##### [Operand format]

Because implied addressing can be automatically employed with an instruction, no particular operand format is necessary.

##### [Description example]

In the case of MULU X

With an 8-bit  $\times$  8-bit multiply instruction, the product of A register and X register is stored in AX. In this example, the A and AX registers are specified by implied addressing.

### 3.4.2 Register addressing

#### [Function]

The general-purpose register to be specified is accessed as an operand with the register specify code (Rn and RPn) of an instruction word in the registered bank specified with the register bank select flag (RBS0 and RBS1). Register addressing is carried out when an instruction with the following operand format is executed. When an 8-bit register is specified, one of the eight registers is specified with 3 bits in the operation code.

#### [Operand format]

Identifier	Description
r	X, A, C, B, E, D, L, H
rp	AX, BC, DE, HL

'r' and 'rp' can be described with absolute names (R0 to R7 and RP0 to RP3) as well as function names (X, A, C, B, E, D, L, H, AX, BC, DE, and HL).

#### [Description example]

MOV A, C; when selecting C register as r

INCW DE; when selecting DE register pair as rp

3.4.3 Direct addressing

[Function]

The memory to be manipulated is addressed with immediate data in an instruction word becoming an operand address.

[Operand format]

Identifier	Description
addr16	Label or 16-bit immediate data

[Description example]

MOV A, !0FE00H; when setting !addr16 to FE00H

[Illustration]

3.4.6 Register indirect addressing

[Function]

Register pair contents specified with a register pair specify code in an instruction word of the register bank specified with a register bank select flag (RBS0 and RBS1) serve as an operand address for addressing the memory to be manipulated. This addressing can be carried out for all the memory spaces.

[Operand format]

Identifier	Description
—	[DE], [HL]

[Description example]

MOV A, [DE]; when selecting [DE] as register pair

Operation code 1 0 0 0 0 1 0 1

[Illustration]

3.4.7 Based addressing

[Function]

8-bit immediate data is added as offset data to the contents of the base register, that is, the HL register pair in an instruction word of the register bank specified with the register bank select flag (RBS0 and RBS1) and the sum is used to address the memory. Addition is performed by expanding the offset data as a positive number to 16 bits. A carry from the 16th bit is ignored. This addressing can be carried out for all the memory spaces.

[Operand format]

Identifier	Description
—	[HL + byte]

[Description example]

MOV A, [HL + 10H]; when setting byte to 10H

★ [Illustration]

3.4.8 Based indexed addressing

[Function]

The B or C register contents specified in an instruction are added to the contents of the base register, that is, the HL register pair in an instruction word of the register bank specified with the register bank select flag (RBS0 and RBS1) and the sum is used to address the memory. Addition is performed by expanding the B or C register contents as a positive number to 16 bits. A carry from the 16th bit is ignored. This addressing can be carried out for all the memory spaces.

[Operand format]

Identifier	Description
—	[HL + B], [HL + C]

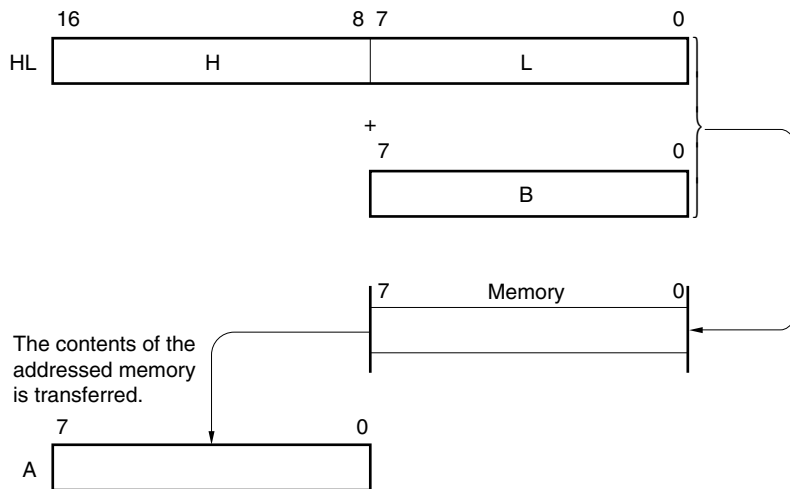

[Description example]

In the case of MOV A, [HL + B] (selecting the B register)

Operation code 1 0 1 0 1 0 1 1

★

[Illustration]

3.4.9 Stack addressing

[Function]

The stack area is indirectly addressed with the stack pointer (SP) contents. This addressing method is automatically employed when the PUSH, POP, subroutine call and return instructions are executed or the register is saved/reset upon generation of an interrupt request. Stack addressing enables to address the internal high-speed RAM area only.

[Description example]

In the case of PUSH DE (saving the DE register)

Operation code 1 0 1 1 0 1 0 1

★ [Illustration]

## CHAPTER 4 PORT FUNCTIONS

### 4.1 Port Functions

The  $\mu$ PD780024AS, 780034AS Subseries products incorporate four input ports and 35 I/O ports. Figure 4-1 shows the port configuration. Every port is capable of 1-bit and 8-bit manipulations and can carry out considerably varied control operations. Besides port functions, the ports can also serve as on-chip hardware I/O pins.

Figure 4-1. Port Types

Table 4-1. Port Functions

Pin Name	Function	Alternate Function
P00	Port 0 4-bit I/O port. Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	INTP0
P01		INTP1
P02		INTP2
P03		INTP3/ADTRG
P10 to P13	Port 1 4-bit input-only port.	ANI0 to ANI3
P20	Port 2 6-bit I/O port. Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	SI30
P21		SO30
P22		$\overline{\text{SCK30}}$
P23		RxD0
P24		TxD0
P25		ASCK0
P34	Port 3 3-bit I/O port. Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be specified by software settings.	SI31
P35		SO31
P36		$\overline{\text{SCK31}}$
P40 to P47	Port 4 8-bit I/O port. Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be specified by software settings. Interrupt request flag (KRIF) is set to 1 by falling edge detection.	—
P50 to P57	Port 5 8-bit I/O port. LEDs can be driven directly. Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	—
P70	Port 7 6-bit I/O port. Input/output mode can be specified in 1-bit units. An on-chip pull-up resistor can be used by software settings.	TI00/TO0
P71		TI01
P72		TI50/TO50
P73		TI51/TO51
P74		PCL
P75		BUZ

## 4.2 Configuration of Ports

A port includes the following hardware.

**Table 4-2. Configuration of Ports**

Item	Configuration
Control register	Port mode register (PMm: m = 0, 2 to 5, 7) Pull-up resistor option register (PUM: m = 0, 2 to 5, 7)
Port	Total: 39 ports (4 inputs, 35 inputs/outputs)
Pull-up resistor	Total: 39 (software control)

### 4.2.1 Port 0

Port 0 is a 4-bit I/O port with output latch. P00 to P03 pins can specify the input mode/output mode in 1-bit units with the port mode register 0 (PM0). An on-chip pull-up resistor of P00 to P03 pins can be used for them in 1-bit units with a pull-up resistor option register 0 (PU0).

This port can also be used as an external interrupt request input, and A/D converter external trigger input.

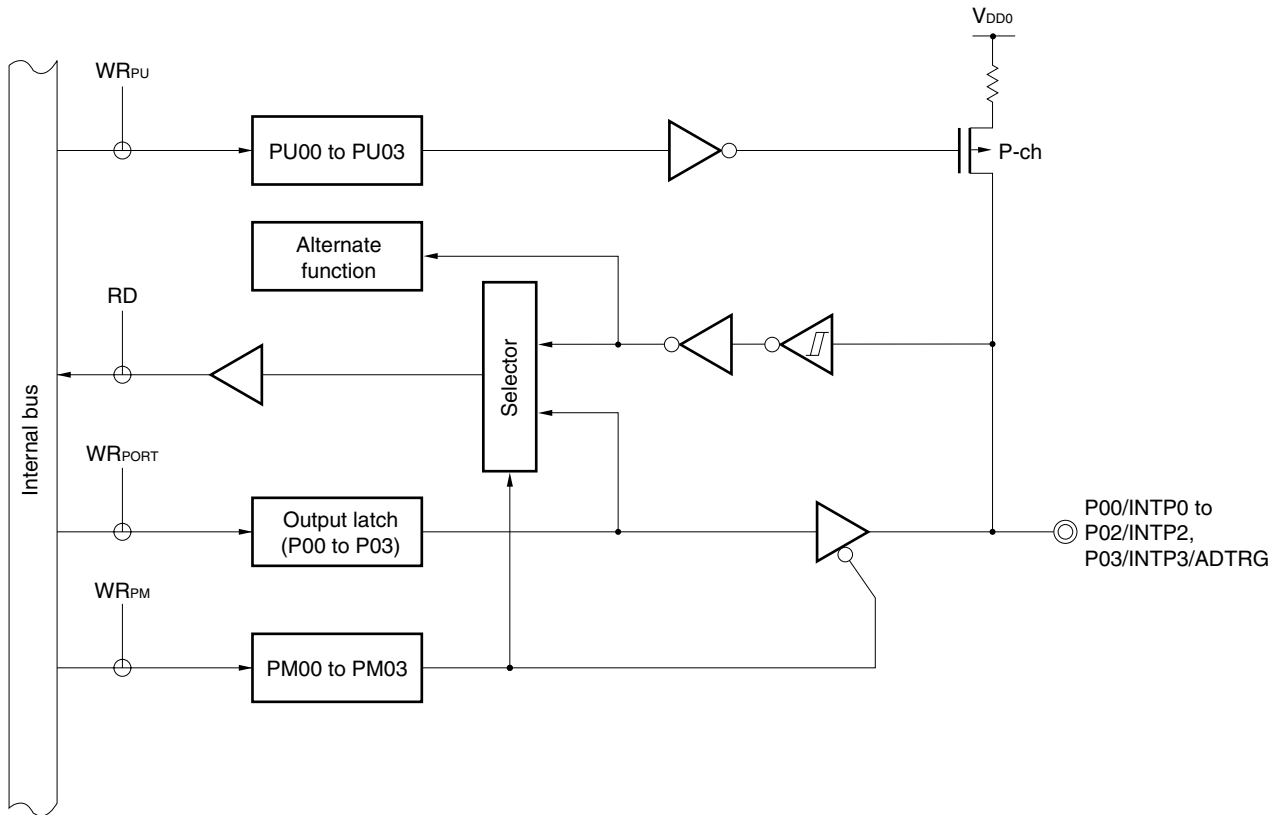

$\overline{\text{RESET}}$  input sets port 0 to input mode.

Figure 4-2 shows a block diagram of port 0.

- ★ **Cautions** 1. Port 0 functions alternately as an external interrupt request input pin. If the output mode of the port function is specified and the output level of the port is changed while interrupts are not disabled by the external interrupt rising edge enable register (EGP) and external interrupt falling edge enable register (EGN), the interrupt request flag is set. Thus, when the output mode is used, set the interrupt mask flag to 1.
- ★ 2. When the external interrupt request function is switched to the port function, edge detection may be performed. Therefore, clear bit n (EGPn) of EGP and bit n (EGNn) of EGN to 0 before selecting the port mode.
- ★ 3. When using P03/INTP3/ADTRG as an A/D converter external trigger input, specify valid edges by setting bits 1 and 2 (EGA00 and EGA01) of A/D converter mode register 0 (ADM0) and set the interrupt mask flag (PMK3) to 1.

**Remark** n = 0 to 3

Figure 4-2. Block Diagram of P00 to P03

- PU: Pull-up resistor option register
- PM: Port mode register
- RD: Port 0 read signal
- WR: Port 0 write signal

### 4.2.2 Port 1

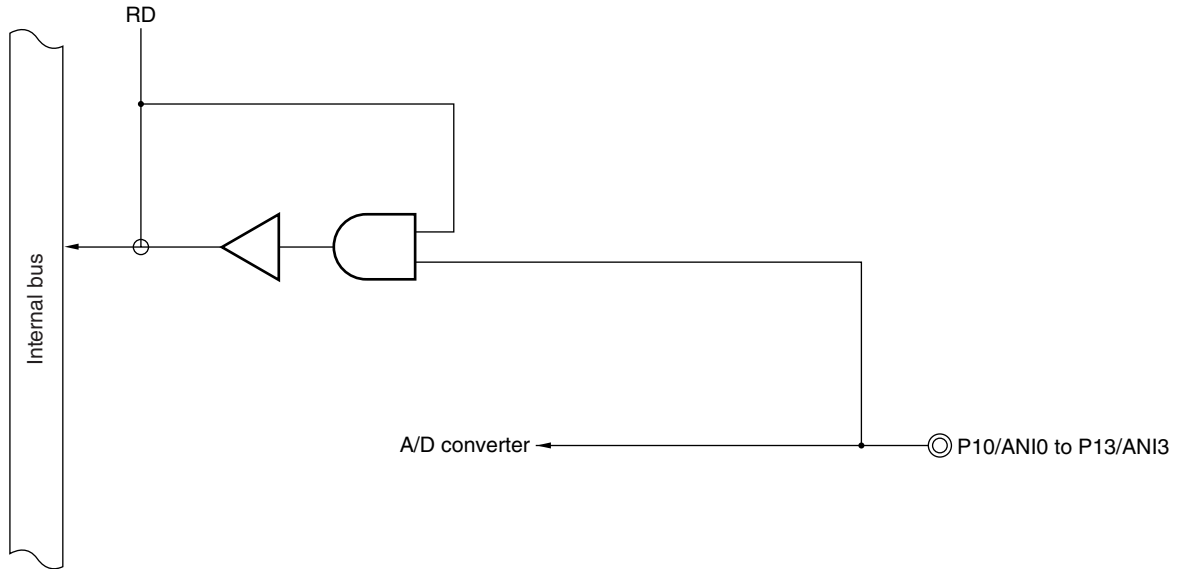

Port 1 is a 4-bit input-only port.

This port can also be used as an A/D converter analog input.

Figure 4-3 shows a block diagram of port 1.

★

Figure 4-3. Block Diagram of P10 to P13

RD: Port 1 read signal

**Caution** When port 1 is used as an input port, the input value can be read using an 8-bit memory manipulation instruction. However, in this case, do not use the higher 4 bits (P17 to P14) because they are undefined. Also, do not read the higher 4 bits using a 1-bit memory manipulation instruction.

4.2.3 Port 2

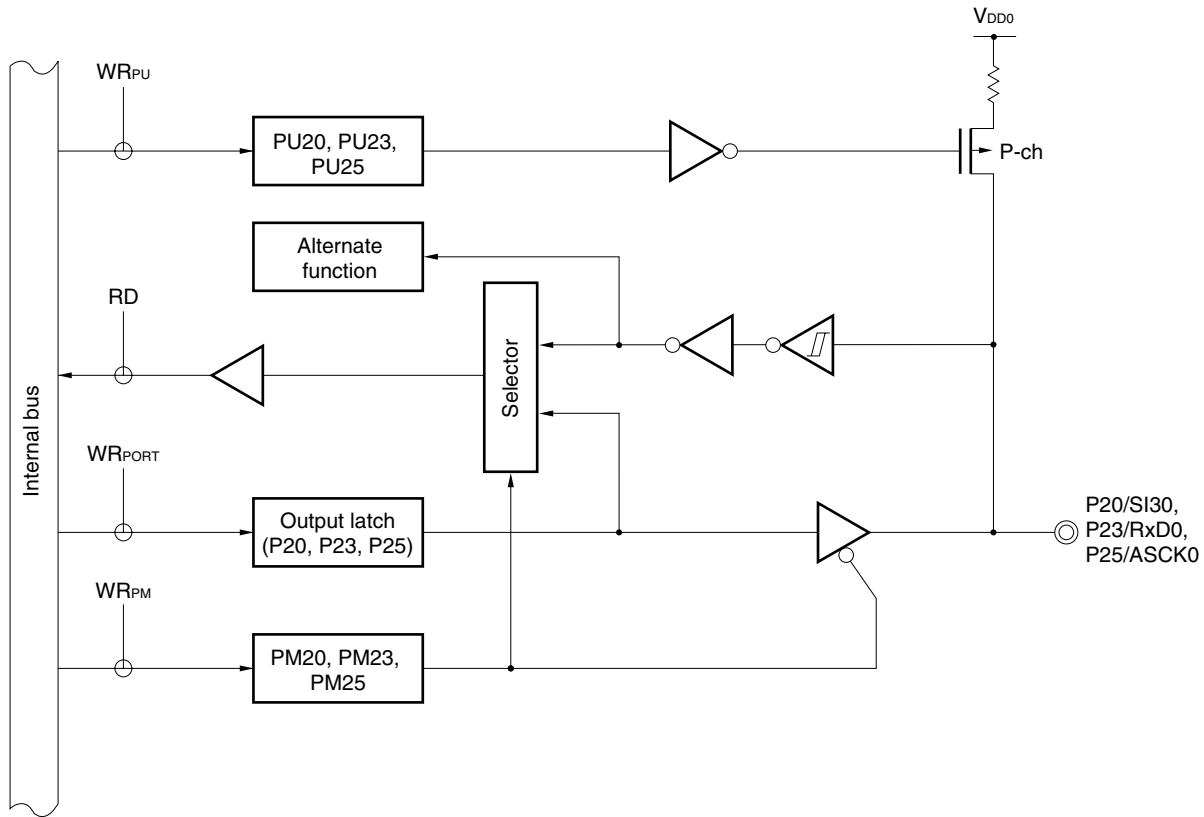

Port 2 is a 6-bit I/O port with output latch. P20 to P25 pins can specify the input mode/output mode in 1-bit units with the port mode register 2 (PM2). An on-chip pull-up resistor of P20 to P25 pins can be used for them in 1-bit units with a pull-up resistor option register 2 (PU2).

This port has also alternate functions as serial interface data I/O and clock I/O.

$\overline{\text{RESET}}$  input sets port 2 to input mode.

Figures 4-4 to 4-6 show block diagrams of port 2.

- PM: Port mode register
- RD: Port 2 read signal
- WR: Port 2 write signal

#### 4.2.4 Port 3

Port 3 is a 3-bit I/O port with output latch. P34 to P36 pins can specify the input mode/output mode in 1-bit units with port mode register 3 (PM3). Use of an on-chip pull-up resistor can be specified for the P34 to P36 pins in 1-bit units by pull-up resistor option register 3 (PU3).

Port 3 can also be used for serial interface data I/O and clock I/O.

$\overline{\text{RESET}}$  input sets port 3 to input mode.

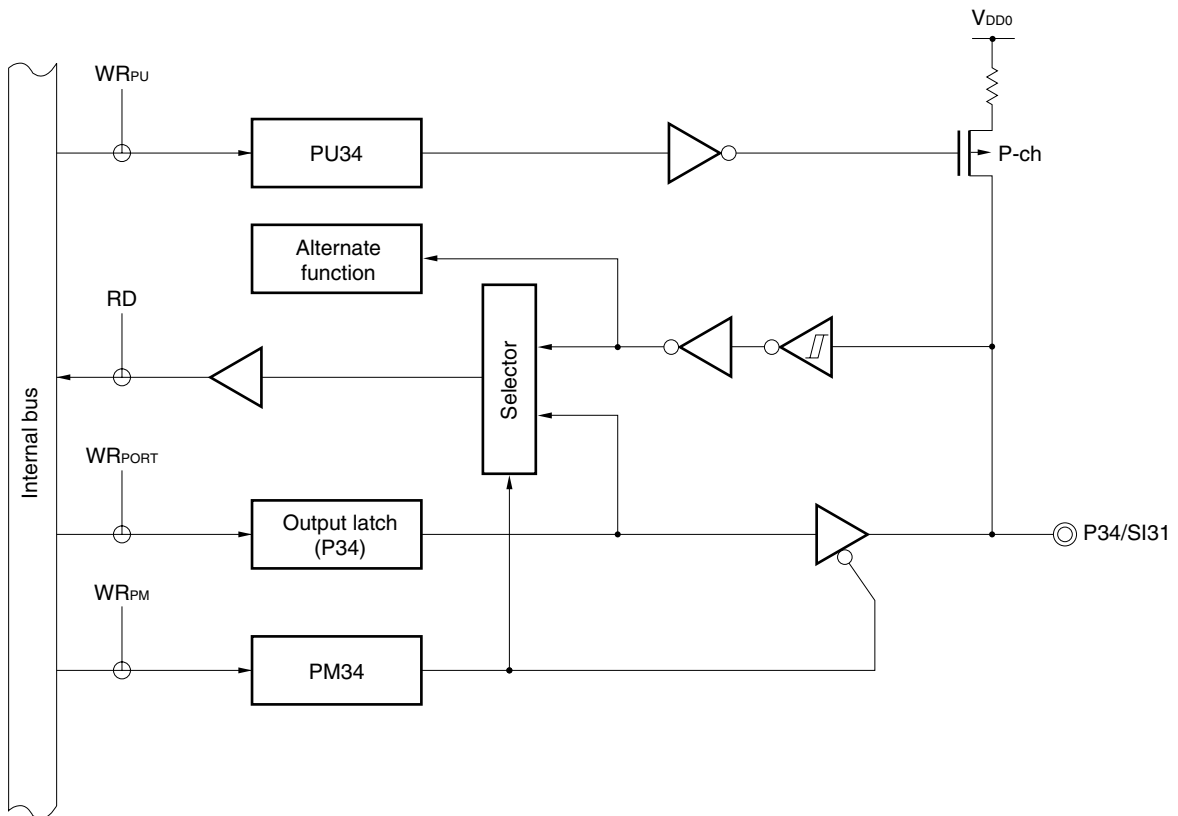

Figures 4-7 to 4-9 show block diagrams of port 3.

**Cautions**

1. When reading port 3 using an 8-bit memory manipulation instruction, do not use the lower 4 bits (P33 to P30) because they are undefined. When writing port 3 using an 8-bit memory manipulation instruction, any values can be written to the lower 4 bits. Execution of a 1-bit memory manipulation instruction for the lower 4 bits is prohibited.

2. Be sure to set the lower 4 bits (PM33 to PM30) of port mode register 3 (PM3) to 1.

Figure 4-7. Block Diagram of P34

4.2.5 Port 4

Port 4 is an 8-bit I/O port with output latch. The P40 to P47 pins can specify the input mode/output mode in 1-bit units with port mode register 4 (PM4). An on-chip pull-up resistor of P40 to P47 pins can be used for them in 1-bit units with pull-up resistor option register 4 (PU4).

The interrupt request flag (KRIF) can be set to 1 by detecting falling edges.

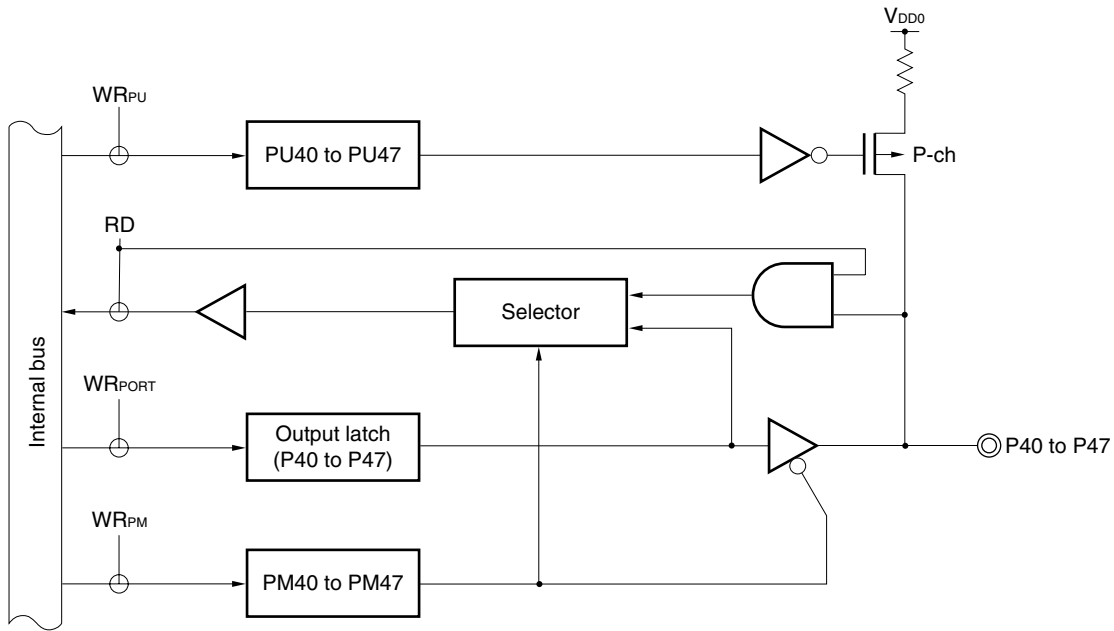

$\overline{\text{RESET}}$  input sets port 4 to input mode.

Figures 4-10 and 4-11 show a block diagram of port 4 and block diagram of the falling edge detector, respectively.

**Caution** When using the falling edge detection interrupt (INTKR), be sure to set the memory expansion mode register (MEM) to 01H.

4.2.6 Port 5

Port 5 is an 8-bit I/O port with output latch. The P50 to P57 pins can specify the input mode/output mode in 1-bit units with port mode register 5 (PM5). An on-chip pull-up resistor of P50 to P57 pins can be used for them in 1-bit units with pull-up resistor option register 5 (PU5).

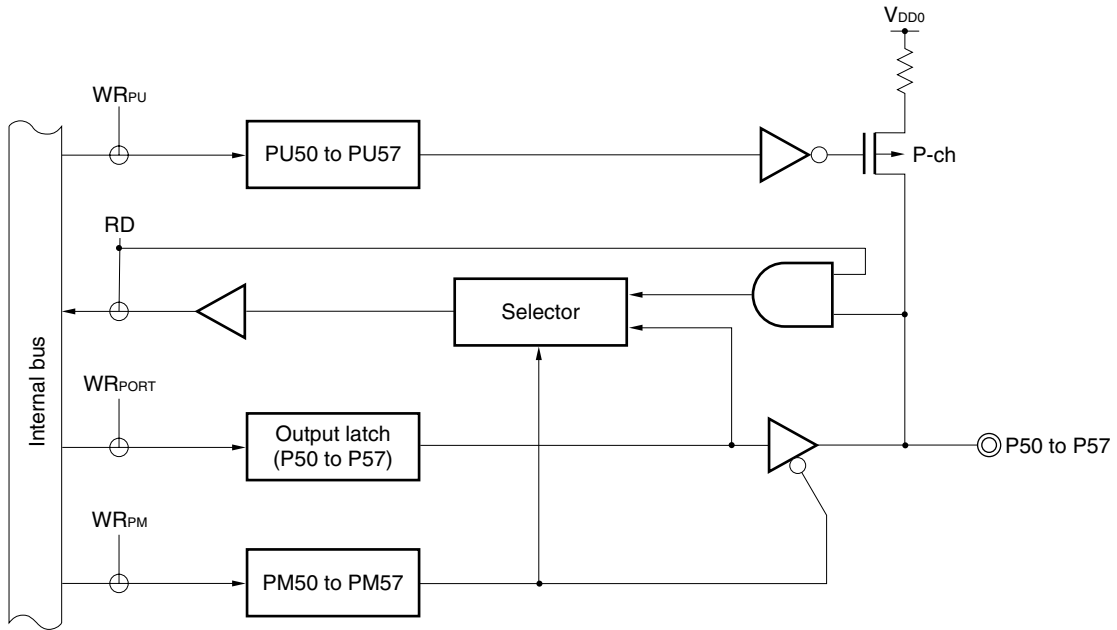

Port 5 can drive LEDs directly.

$\overline{\text{RESET}}$  input sets port 5 to input mode.

Figure 4-12 shows a block diagram of port 5.

★

4.2.7 Port 7

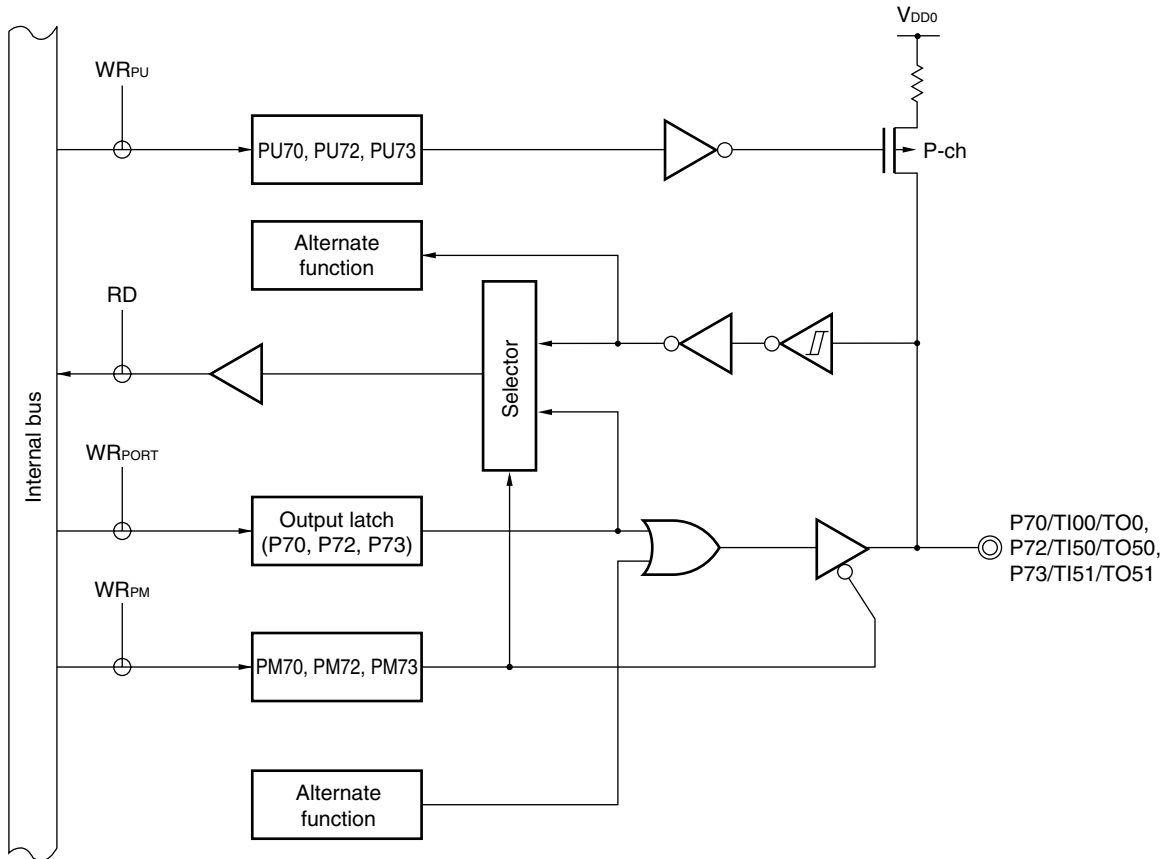

Port 7 is a 6-bit I/O port with output latch. The P70 to P75 pins can specify the input mode/output mode in 1-bit units with port mode register 7 (PM7). An on-chip pull-up resistor of P70 to P75 pins can be used for them in 1-bit units with pull-up resistor option register 7 (PU7).

This port can also be used as a timer I/O, clock output, and buzzer output.

$\overline{\text{RESET}}$  input sets port 7 to input mode.

Figures 4-13 to 4-15 show block diagrams of port 7.

### 4.3 Registers Controlling Port Function

The following two types of registers are used to control the ports.

- Port mode registers (PM0, PM2 to PM5, PM7)
- Pull-up resistor option registers (PU0, PU2 to PU5, PU7)

#### (1) Port mode registers (PM0, PM2 to PM5, PM7)

These registers are used to set port input/output in 1-bit units.

PM0, PM2 to PM5, and PM7 are independently set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets these registers to FFH.

★

When using a port pin as its alternate-function pin, set the port mode registers and output latches as shown in Table 4-3.

**Cautions** 1. Pins P10 to P17 are input-only pins.

2. Port 0 functions alternately as an external interrupt request input pin. If the output mode of the port function is specified and the output level of the port is changed while interrupts are not disabled by the external interrupt rising edge enable register (EGP) and external interrupt falling edge enable register (EGN), the interrupt request flag is set. When the output mode is used, therefore, the interrupt mask flag should be set to 1 beforehand.
3. If a port has an alternate function pin and it is used as an alternate output function, clear the corresponding output latches (P0 and P2 to P7) to 0.

P74	PCL	Output	0	0
P75	BUZ	Output	0	0

**Remark** ×: Don't care  
 PM<sub>xx</sub>: Port mode register  
 P<sub>xx</sub>: Port output latch

**(2) Pull-up resistor option registers (PU0, PU2 to PU5, PU7)**

These registers are used to set whether to use an on-chip pull-up resistor at each port or not. By setting PU0, PU2 to PU5, and PU7, the on-chip pull-up resistors of the port pins corresponding to the bits in PU0, PU2 to PU5, and PU7 can be used.

PU0, PU2 to PU5, and PU7 are independently set by a 1-bit or 8-bit memory manipulation instruction.  $\overline{\text{RESET}}$  input clears these registers to 00H.

**Cautions** 1. The P10 to P13 pins do not incorporate a pull-up resistor.

2. When PUm is set to 1, the on-chip pull-up resistor is connected irrespective of the input/output mode. When using in output mode, therefore, set the bit of PUm to 0 (m = 0, 2 to 5, 7).

## 4.4 Operations of Port Function

Port operations differ depending on whether the input or output mode is set, as shown below.

**Caution** In the case of 1-bit memory manipulation instruction, although a single bit is manipulated, the port is accessed as an 8-bit unit. Therefore, on a port with a mixture of input and output pins, the output latch contents for pins specified as input are undefined, even for bits other than the manipulated bit.

### 4.4.1 Writing to I/O port

#### (1) Output mode

A value is written to the output latch by a transfer instruction, and the output latch contents are output from the pin.

Once data is written to the output latch, it is retained until data is written to the output latch again.

★ The output latch data is cleared by reset.

#### (2) Input mode

A value is written to the output latch by a transfer instruction, but since the output buffer is OFF, the pin status does not change.

Once data is written to the output latch, it is retained until data is written to the output latch again.

### 4.4.2 Reading from I/O port

#### (1) Output mode

The output latch contents are read by a transfer instruction. The output latch contents do not change.

#### (2) Input mode

The pin status is read by a transfer instruction. The output latch contents do not change.

### 4.4.3 Operations on I/O port

#### (1) Output mode

An operation is performed on the output latch contents, and the result is written to the output latch. The output latch contents are output from the pins.

Once data is written to the output latch, it is retained until data is written to the output latch again.

★ The output latch data is cleared by reset.

#### (2) Input mode

The output latch contents are undefined, but since the output buffer is OFF, the pin status does not change.

## CHAPTER 5 CLOCK GENERATOR

### 5.1 Functions of Clock Generator

The clock generator generates the clock to be supplied to the CPU and peripheral hardware. The following two types of system clock oscillators are available.

#### (1) Main system clock oscillator

★ This circuit oscillates a clock with a frequency of 1 to 12 MHz. Oscillation can be stopped by executing the STOP instruction or setting the processor clock control register (PCC).

#### (2) Subsystem clock oscillator

The circuit oscillates a clock with a frequency of 32.768 kHz. Oscillation cannot be stopped. If the subsystem clock oscillator is not used, the internal feedback resistor can be disabled by the processor clock control register (PCC). This enables to reduce the power consumption in the STOP mode.

### 5.2 Configuration of Clock Generator

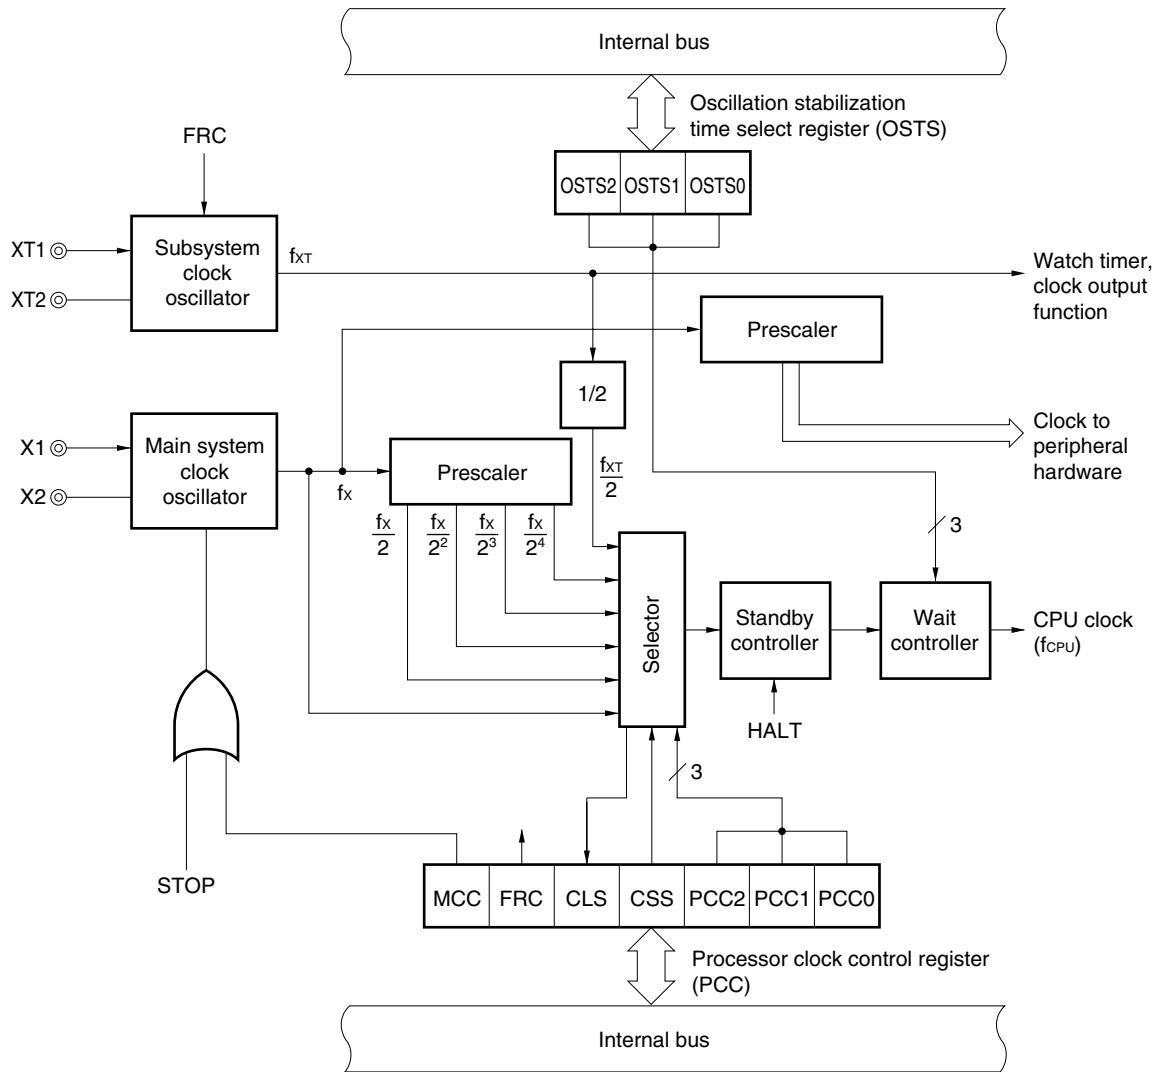

The clock generator includes the following hardware.

**Table 5-1. Configuration of Clock Generator**

Item	Configuration
Control registers	Processor clock control register (PCC) Oscillation stabilization time select register (OSTS)
Oscillators	Main system clock oscillator Subsystem clock oscillator
Controllers	Prescaler Standby controller Wait controller

★

Figure 5-1. Block Diagram of Clock Generator

### 5.3 Registers Controlling Clock Generator

The clock generator is controlled by the following two registers.

- Processor clock control register (PCC)
- Oscillation stabilization time select register (OSTS)

#### (1) Processor clock control register (PCC)

This register selects the CPU clock and the division ratio, sets main system clock oscillator operation/stop and sets whether to use the subsystem clock oscillator internal feedback resistor<sup>Note</sup>.

PCC is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets the value of PCC to 04H.

- ★ **Note** The feedback resistor is required to control the bias point of the oscillation waveform so that the bias point is in the middle of the power supply voltage.
- When the subsystem clock is not used, the power consumption in the STOP mode can be reduced by setting bit 6 (FRC) of PCC to 1 (see **Figure 5-7 Subsystem Clock Feedback Resistor**).

Figure 5-2. Format of Processor Clock Control Register (PCC)

Address: FFFBH After reset: 04H R/W<sup>Note 1</sup>

Symbol	<7>	<6>	<5>	<4>	3	2	1	0
PCC	MCC	FRC	CLS	CSS	0	PCC2	PCC1	PCC0

MCC	Main system clock oscillation control <sup>Note 2</sup>
0	Oscillation possible
1	Oscillation stopped

FRC	Subsystem clock feedback resistor selection
0	Internal feedback resistor used
1	Internal feedback resistor not used <sup>Note 3</sup>

CLS	CPU clock status
0	Main system clock
1	Subsystem clock

CSS	PCC2	PCC1	PCC0	CPU clock (f <sub>cpu</sub> ) selection
0	0	0	0	f <sub>x</sub>
	0	0	1	f <sub>x</sub> /2
	0	1	0	f <sub>x</sub> /2 <sup>2</sup>
	0	1	1	f <sub>x</sub> /2 <sup>3</sup>
	1	0	0	f <sub>x</sub> /2 <sup>4</sup>
1	0	0	0	f <sub>xT</sub> /2
	0	0	1	
	0	1	0	
	0	1	1	
	1	0	0	
Other than above				Setting prohibited

- Notes**
1. Bit 5 is read-only.
  2. When the CPU is operating on the subsystem clock, MCC should be used to stop the main system clock oscillation. A STOP instruction should not be used.
  3. This bit can be set to 1 only when the subsystem clock is not used.

- Cautions**
1. Be sure to set bit 3 to 0.
  2. When the external clock is input, MCC should not be set. This is because the X2 pin is connected to V<sub>DD1</sub> via a pull-up resistor.

- Remarks**
1. f<sub>x</sub>: Main system clock oscillation frequency
  2. f<sub>xT</sub>: Subsystem clock oscillation frequency

The fastest instructions of  $\mu$ PD780024AS, 780034AS Subseries are carried out in two CPU clocks. The relationship between the CPU clock ( $f_{CPU}$ ) and minimum instruction execution time is shown in Table 5-2.

**Table 5-2. Relationship Between CPU Clock and Minimum Instruction Execution Time**

CPU Clock ( $f_{CPU}$ )	Minimum Instruction Execution Time: $2/f_{CPU}$
$f_x$	0.166 $\mu$ s
$f_x/2$	0.333 $\mu$ s
$f_x/2^2$	0.666 $\mu$ s
$f_x/2^3$	1.33 $\mu$ s
$f_x/2^4$	2.66 $\mu$ s
$f_{XT}/2$	122 $\mu$ s

$f_x = 12$  MHz,  $f_{XT} = 32.768$  kHz

$f_x$ : Main system clock oscillation frequency

$f_{XT}$ : Subsystem clock oscillation frequency

**(2) Oscillation stabilization time select register (OSTS)**

This register is used to select the oscillation stabilization time from when reset is effected or STOP mode is released to when oscillation is stabilized.

OSTS is set by an 8-bit memory manipulation instruction.

$\overline{RESET}$  input sets OSTS to 04H. Thus, when releasing the STOP mode by  $\overline{RESET}$  input, the time required to release is  $2^{17}/f_x$ .

**Figure 5-3. Format of Oscillation Stabilization Time Select Register (OSTS)**

Address: FFFAH After reset: 04H R/W

Symbol	7	6	5	4	3	2	1	0
OSTS	0	0	0	0	0	OSTS2	OSTS1	OSTS0

OSTS2	OSTS1	OSTS0	Selection of oscillation stabilization time
0	0	0	$2^{12}/f_x$ (341 $\mu$ s)
0	0	1	$2^{14}/f_x$ (1.36 ms)
0	1	0	$2^{15}/f_x$ (2.73 ms)
0	1	1	$2^{16}/f_x$ (5.46 ms)
1	0	0	$2^{17}/f_x$ (10.9 ms)
Other than the above			Setting prohibited

★ **Caution** The wait time when STOP mode is released does not include the time (“a” in the figure below) from when STOP mode is released until the clock starts oscillation. This also applies when  $\overline{\text{RESET}}$  is input and an interrupt request is generated.

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. Figures in parentheses are for operation with  $f_x = 12$  MHz.

## 5.4 System Clock Oscillator

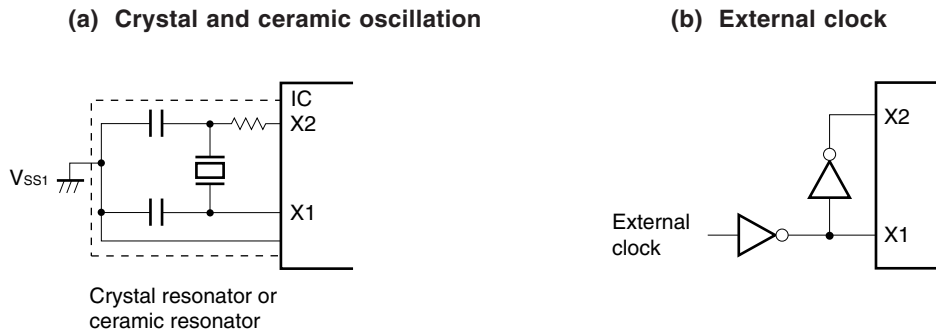

### 5.4.1 Main system clock oscillator

The main system clock oscillator oscillates with a crystal resonator or a ceramic resonator (12 MHz TYP.) connected to the X1 and X2 pins.

External clocks can be input to the main system clock oscillator. In this case, input a clock signal to the X1 pin and an inverted-phase clock signal to the X2 pin.

Figure 5-4 shows an external circuit of the main system clock oscillator.

Figure 5-4. External Circuit of Main System Clock Oscillator

**Caution** Do not execute the STOP instruction and do not set MCC (bit 7 of processor clock control register (PCC)) to 1 if an external clock is input. This is because when the STOP instruction or MCC is set to 1, the main system clock operation stops and the X2 pin is connected to  $V_{DD1}$  via a pull-up resistor.

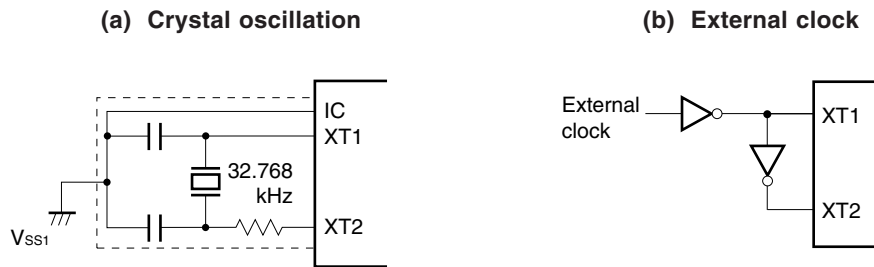

### 5.4.2 Subsystem clock oscillator

The subsystem clock oscillator oscillates with a crystal resonator (32.768 kHz TYP.) connected to the XT1 and XT2 pins.

External clocks can be input to the subsystem clock oscillator. In this case, input a clock signal to the XT1 pin and an inverted-phase clock signal to the XT2 pin.

Figure 5-5 shows an external circuit of the subsystem clock oscillator.

**Figure 5-5. External Circuit of Subsystem Clock Oscillator**

Cautions are listed on the next page.

**Cautions 1.** When using the main system clock oscillator and a subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in Figures 5-4 and 5-5 to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines. Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as  $V_{SS1}$ . Do not ground the capacitor to a ground pattern through which a high current flows.
- Do not fetch signals from the oscillator.

Take special note of the fact that the subsystem clock oscillator is a circuit with low-level amplification so that power consumption is maintained at low levels.

Figure 5-6 shows examples of incorrect resonator connection.

Figure 5-6. Examples of Incorrect Resonator Connection (1/2)

(a) Too long wiring

(b) Crossed signal line

**Remark** When using a subsystem clock, replace X1 and X2 with XT1 and XT2, respectively. Further, insert resistors in series on the side of XT2.

Figure 5-6. Examples of Incorrect Resonator Connection (2/2)

(c) Wiring near high alternating current

(d) Current flowing through ground line of oscillator (potential at points A, B, and C fluctuates)

(e) Signals are fetched

**Remark** When using a subsystem clock, replace X1 and X2 with XT1 and XT2, respectively. Also, insert resistors in series on the XT2 side.

**Cautions 2.** When X2 and XT1 are wired in parallel, the crosstalk noise of X2 may increase with XT1, resulting in malfunctioning.

To prevent that from occurring, it is recommended to wire X2 and XT1 so that they are not in parallel, and to connect the IC pin between X2 and XT1 directly to VSS1.

**5.4.3 When no subsystem clocks are used**

If it is not necessary to use subsystem clocks for low power consumption operations and clock operations, connect the XT1 and XT2 pins as follows.

- ★ XT1: Connect directly to  $V_{DD0}$  or  $V_{DD1}$
- XT2: Leave open

In this state, however, some current may leak via the internal feedback resistor of the subsystem clock oscillator when the main system clock stops. To minimize leakage current, the above internal feedback resistor can be removed by setting bit 6 (FRC) of the processor clock control register (PCC). In this case also, connect the XT1 and XT2 pins as described above.

**Figure 5-7. Subsystem Clock Feedback Resistor**

- ★ **Remark** The feedback resistor is required to control the bias point of the oscillation waveform so that the bias point is in the middle of the power supply voltage.

## 5.5 Operations of Clock Generator

The clock generator generates the following various types of clocks and controls the CPU operating mode including the standby mode.

- Main system clock  $f_x$
- Subsystem clock  $f_{XT}$
- CPU clock  $f_{CPU}$
- Clock to peripheral hardware

The following clock generator functions and operations are determined with the processor clock control register (PCC).

- (a) Upon generation of  $\overline{\text{RESET}}$  signal, the lowest speed mode of the main system clock (2.66  $\mu\text{s}$  @ 12 MHz operation) is selected (PCC = 04H). Main system clock oscillation stops while low level is applied to  $\overline{\text{RESET}}$  pin.
- ★ (b) With the main system clock selected, one of the five minimum instruction execution time types (0.166  $\mu\text{s}$ , 0.333  $\mu\text{s}$ , 0.666  $\mu\text{s}$ , 1.33  $\mu\text{s}$ , 2.66  $\mu\text{s}$  @ 12 MHz operation) can be selected by setting the PCC.
- (c) With the main system clock selected, two standby modes, the STOP and HALT modes, are available. To reduce current consumption in the STOP mode, the subsystem clock feedback resistor can be disconnected to stop the subsystem clock.
- (d) The PCC can be used to select the subsystem clock and to operate the system with low-power consumption (122  $\mu\text{s}$  @ 32.768 kHz operation).
- (e) With the subsystem clock selected, main system clock oscillation can be stopped with the PCC. The HALT mode can be used. However, the STOP mode cannot be used (subsystem clock oscillation cannot be stopped).
- (f) The main system clock is divided and supplied to the peripheral hardware. The subsystem clock is supplied to the watch timer and clock output functions only. Thus the watch function and the clock output function can also be continued in the standby state. However, since all other peripheral hardware operate with the main system clock, the peripheral hardware also stops if the main system clock is stopped (except external input clock operation).

**5.5.1 Main system clock operations**

When operated with the main system clock (with bit 5 (CLS) of the processor clock control register (PCC) set to 0), the following operations are carried out by PCC setting.

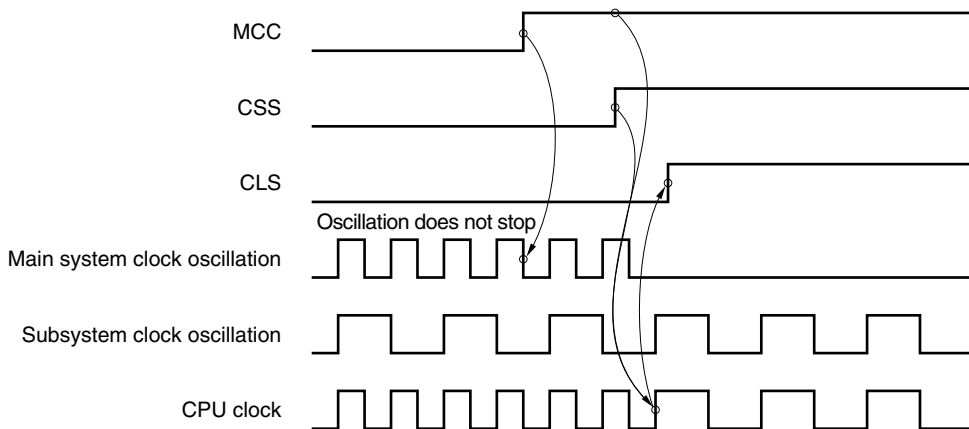

- (a) Because the operation guarantee instruction execution speed depends on the power supply voltage, the minimum instruction execution time can be changed by bits 0 to 2 (PCC0 to PCC2) of the PCC.
- ★ (b) When bit 4 (CSS) of PCC is set to 1 when operating with the main system clock, if bit 7 (MCC) of PCC is set to 1 after the operation has been switched to the subsystem clock (CLS = 1), the main system clock oscillation stops (see **Figure 5-8 (1)**).
- (c) If bit 7 (MCC) of PCC is set to 1 when operating with the main system clock, the main system clock oscillation does not stop. When bit 4 (CSS) of PCC is set to 1 and the operation is switched to the subsystem clock (CLS = 1) after that, the main system clock oscillation stops (see **Figure 5-8 (2)**).

**Figure 5-8. Main System Clock Stop Function**

**(1) Operation when MCC is set after setting CSS with main system clock operation**

★ **(2) Operation when CSS is set after setting MCC with main system clock operation**

5.6.2 System clock and CPU clock switching procedure

This section describes switching procedure between the system clock and CPU clock.

Figure 5-9. System Clock and CPU Clock Switching

- <1> The CPU is reset by setting the  $\overline{\text{RESET}}$  signal to low level after power-on. After that, when reset is released by setting the  $\overline{\text{RESET}}$  signal to high level, main system clock starts oscillation. At this time, oscillation stabilization time ( $2^{17}/f_x$ ) is secured automatically. After that, the CPU starts executing the instruction at the minimum speed of the main system clock ( $2.66 \mu\text{s}$  @ 12 MHz operation).
- <2> After the lapse of a sufficient time for the V<sub>DD</sub> voltage to increase to enable operation at maximum speeds, the PCC is rewritten and maximum-speed operation is carried out.
- <3> Upon detection of a decrease of the V<sub>DD</sub> voltage due to an interrupt request signal, the main system clock is switched to the subsystem clock (which must be in an oscillation stable state).
- <4> Upon detection of V<sub>DD</sub> voltage reset due to an interrupt, 0 is set to bit 7 (MCC) of the PCC and oscillation of the main system clock is started. After the lapse of time required for stabilization of oscillation, the PCC is rewritten and the maximum-speed operation is resumed.

**Caution** When subsystem clock is being operated while the main system clock is stopped, if switching to the main system clock is done again, be sure to switch after securing oscillation stabilization time by program.

### 6.1 Functions of 16-Bit Timer/Event Counter 0

16-bit timer/event counter 0 has the following functions.

**(1) Interval timer**

16-bit timer/event counter 0 generates interrupt requests at the preset time interval.

- Number of counts: 2 to 65536

**(2) External event counter**

16-bit timer/event counter 0 can measure the number of pulses with a high-/low-level width of a signal input externally.

- Valid level pulse width:  $16/f_x$  or more

**(3) Pulse width measurement**

16-bit timer/event counter 0 can measure the pulse width of an externally input signal.

- Valid level pulse width:  $2/f_x$  or more

**(4) Square-wave output**

16-bit timer/event counter 0 can output a square wave with any selected frequency.

- Cycle:  $(2 \times 2$  to  $65536 \times 2) \times$  count clock cycle

**(5) PPG output**

16-bit timer/event counter 0 can output a square wave that have arbitrary cycle and pulse width.

- $2 < \text{Pulse width} < \text{Cycle} \leq (\text{FFFF} + 1) \text{ H}$

## 6.2 Configuration of 16-Bit Timer/Event Counter 0

16-bit timer/event counter 0 includes the following hardware.

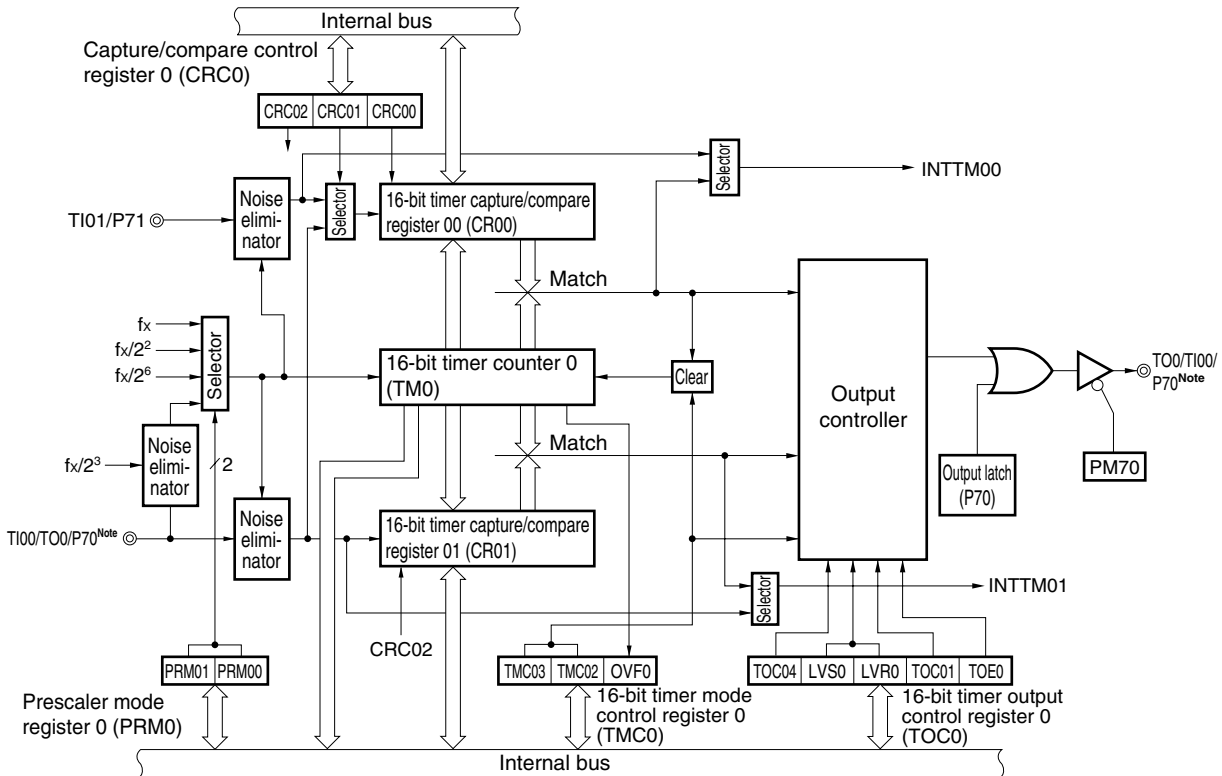

**Table 6-1. Configuration of 16-Bit Timer/Event Counter 0**

Item	Configuration
Timer counter	16-bit timer counter 0 (TM0)
Register	16-bit timer capture/compare registers 00, 01 (CR00, CR01)
Timer input	TI00, TI01
Timer output	TO0
Control registers	16-bit timer mode control register 0 (TMC0) Capture/compare control register 0 (CRC0) 16-bit timer output control register 0 (TOC0) Prescaler mode register 0 (PRM0) Port mode register 7 (PM7) Port 7 (P7)

Figure 6-1 shows block diagram of this counter.

★

**Figure 6-1. Block Diagram of 16-Bit Timer/Event Counter 0**

**Note** TI00 input and TO0 output cannot be used at the same time.

**(1) 16-bit timer counter 0 (TM0)**

TM0 is a 16-bit read-only register that counts count pulses.

The counter is incremented in synchronization with the rising edge of the count clock. If the count value is read during operation, input of the count clock is temporarily stopped, and the count value at that point is read. The count value is reset to 0000H in the following cases.

- <1> At  $\overline{\text{RESET}}$  input
- <2> If TMC03 and TMC02 are cleared
- <3> If the valid edge of TI00 is input in the clear & start mode entered by inputting the valid edge of TI00
- <4> If TM0 and CR00 match in the clear & start mode entered on a match between TM0 and CR00

**(2) 16-bit timer capture/compare register 00 (CR00)**

CR00 is a 16-bit register which has the functions of both a capture register and a compare register. Whether it is used as a capture register or as a compare register is set by bit 0 (CRC00) of capture/compare control register 0 (CRC0).

- **When CR00 is used as a compare register**

The value set in CR00 is constantly compared with the 16-bit timer counter 0 (TM0) count value, and an interrupt request (INTTM00) is generated if they match. It can also be used as the register that holds the interval time then TM0 is set to interval timer operation.

- **When CR00 is used as a capture register**

It is possible to select the valid edge of the TI00 pin or the TI01 pin as the capture trigger. Setting of the TI00 or TI01 valid edge is performed by means of prescaler mode register 0 (PRM0) (see **Table 6-2**).

★

**Table 6-2. CR00 Capture Trigger and Valid Edges of TI00 and TI01 Pins**

**(1) TI00 pin valid edge selected as capture trigger (CRC01 = 1, CRC00 = 1)**

CR00 Capture Trigger	TI00 Pin Valid Edge		
	ES01	ES00	
Falling edge	Rising edge	0	1
Rising edge	Falling edge	0	0
No capture operation	Both rising and falling edges	1	1

**(2) TI01 pin valid edge selected as capture trigger (CRC01 = 0, CRC00 = 1)**

CR00 Capture Trigger	TI01 Pin Valid Edge		
	ES11	ES10	
Falling edge	Falling edge	0	0
Rising edge	Rising edge	0	1
Both rising and falling edges	Both rising and falling edges	1	1

**Remarks 1.** Setting ES01, ES00 = 1, 0 and ES11, ES10 = 1, 0 is prohibited.

- 2. ES01, ES00: Bits 5 and 4 of prescaler mode register 0 (PRM0)
- ES11, ES10: Bits 7 and 6 of prescaler mode register 0 (PRM0)
- CRC01, CRC00: Bits 1 and 0 of capture/compare control register 0 (CRC0)

CR00 is set by a 16-bit memory manipulation instruction.  
 $\overline{\text{RESET}}$  input makes CR00 undefined.

- Cautions**
1. Set CR00 to a value other than 0000H in the clear & start mode entered on a match between TM0 and CR00. However, in the free-running mode and in the clear mode using the valid edge of TI00, if CR00 is cleared to 0000H, an interrupt request (INTTM00) is generated when CR00 changes from 0000H to 0001H following overflow (FFFFH).
  2. If the new value of CR00 is less than the value of 16-bit timer counter 0 (TM0), TM0 continues counting, overflows, and then starts counting from 0 again. If the new value of CR00 is less than the old value, therefore, the timer must be reset to be restarted after the value of CR00 is changed.
  3. When P70 is used as the input pin for the valid edge of TI00, it cannot be used as a timer output (TO0). Moreover, when P70 is used as TO0, it cannot be used as the input pin for the valid edge of TI00.

### (3) 16-bit timer capture/compare register 01 (CR01)

CR01 is a 16-bit register which has the functions of both a capture register and a compare register. Whether it is used as a capture register or a compare register is set by bit 2 (CRC02) of capture/compare control register 0 (CRC0).

- **When CR01 is used as a compare register**

The value set in CR01 is constantly compared with the 16-bit timer counter 0 (TM0) count value, and an interrupt request (INTTM01) is generated if they match.

- **When CR01 is used as a capture register**

It is possible to select the valid edge of the TI00 pin as the capture trigger. The TI00 valid edge is set by means of prescaler mode register 0 (PRM0) (see **Table 6-3**).

★

**Table 6-3. CR01 Capture Trigger and Valid Edge of TI00 Pin (CRC02 = 1)**

CR01 Capture Trigger	TI00 Pin Valid Edge		
		ES01	ES00
Falling edge	Falling edge	0	0
Rising edge	Rising edge	0	1
Both rising and falling edges	Both rising and falling edges	1	1

- Remarks**
1. Setting ES01, ES00 = 1, 0 is prohibited.
  2. ES01, ES00: Bits 5 and 4 of prescaler mode register 0 (PRM0)  
 CRC02: Bit 2 of capture/compare control register 0 (CRC0)

CR01 is set by a 16-bit memory manipulation instruction.  
 $\overline{\text{RESET}}$  input makes CR01 undefined.

**Caution** Set CR01 to other than 0000H in the clear & start mode entered on a match between TM0 and CR00. However, in the free-running mode and in the clear mode using the valid edge of TI00, if CR01 is cleared to 0000H, an interrupt request (INTTM01) is generated when CR01 changes from 0000H to 0001H following overflow (FFFFH).

### 6.3 Registers Controlling 16-Bit Timer/Event Counter 0

The following six registers are used to control 16-bit timer/event counter 0.

- 16-bit timer mode control register 0 (TMC0)
- Capture/compare control register 0 (CRC0)
- 16-bit timer output control register 0 (TOC0)
- Prescaler mode register 0 (PRM0)
- Port mode register 7 (PM7)
- Port 7 (P7)

#### (1) 16-bit timer mode control register 0 (TMC0)

This register sets the 16-bit timer operating mode, the 16-bit timer counter 0 (TM0) clear mode, and output timing, and detects an overflow.

TMC0 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears TMC0 to 00H.

**Caution** 16-bit timer counter 0 (TM0) starts operation at the moment TMC02 and TMC03 (operation stop mode) are set to a value other than 0, 0, respectively. Clear TMC02 and TMC03 to 0, 0 to stop the operation.

★

Figure 6-2. Format of 16-Bit Timer Mode Control Register 0 (TMC0)

Address: FF60H    After reset: 00H    R/W

Symbol	7	6	5	4	<3>	<2>	1	<0>
TMC0	0	0	0	0	TMC03	TMC02	0	OVF0

TMC03	TMC02	Operating mode and clear mode selection	TO0 output timing selection	Interrupt request generation
0	0	Operation stop (TM0 cleared to 0)	No change	Not generated
0	1	Free-running mode	Match between TM0 and CR00 or match between TM0 and CR01	Generated on match between TM0 and CR00, or match between TM0 and CR01
1	0	Clear & start on TI00 valid edge <sup>Note 1</sup>	–	
1	1	Clear & start on match between TM0 and CR00 <sup>Note 2</sup>	Match between TM0 and CR00 or match between TM0 and CR01	

OVF0	Overflow detection of 16-bit timer counter 0 (TM0)
0	Overflow not detected
1	Overflow detected

- Notes**
1. Set the valid edge of the TI00/TO0/P70 pin with prescaler mode register 0 (PRM0).
  2. If the clear & start mode entered on a match between TM0 and CR00 is selected, when the set value of CR00 is FFFFH and the TM0 value changes from FFFFH to 0000H, the OVF0 flag is set to 1.

- Cautions**
1. To write different data to TMC0, stop the timer operation before writing.
  2. The timer operation must be stopped before writing to bits other than the OVF0 flag.

**Remark**

TO0: Output pin of 16-bit timer/event counter 0  
 TI00: Input pin of 16-bit timer/event counter 0  
 TM0: 16-bit timer counter 0  
 CR00: 16-bit timer capture/compare register 00  
 CR01: 16-bit timer capture/compare register 01

**(2) Capture/compare control register 0 (CRC0)**

This register controls the operation of the 16-bit timer capture/compare registers (CR00, CR01). CRC0 is set by a 1-bit or 8-bit memory manipulation instruction.  $\overline{\text{RESET}}$  input clears CRC0 to 00H.

**Figure 6-3. Format of Capture/Compare Control Register 0 (CRC0)**

Address: FF62H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
CRC0	0	0	0	0	0	CRC02	CRC01	CRC00
CRC02	CR01 operating mode selection							
0	Operate as compare register							
1	Operate as capture register							
CRC01	CR00 capture trigger selection							
0	Capture on valid edge of TI01							
1	Capture on valid edge of TI00 by reverse phase <sup>Note</sup>							
CRC00	CR00 operating mode selection							
0	Operate as compare register							
1	Operate as capture register							

**Note** If both the rising and falling edges have been selected as the valid edges of TI00, capture is not performed.

- Cautions**
1. The timer operation must be stopped before setting CRC0.
  2. When the clear & start mode entered on a match between TM0 and CR00 is selected by 16-bit timer mode control register 0 (TMC0), CR00 should not be specified as a capture register.
  3. To ensure the reliability of the capture operation, the capture trigger requires a pulse longer than two cycles of the count clock selected by prescaler mode register 0 (PRM0) (see Figure 6-31).

**(3) 16-bit timer output control register 0 (TOC0)**

This register controls the operation of the 16-bit timer/event counter 0 output controller. It sets R-S type flip-flop (LV0) set/reset, output inversion enable/disable, and 16-bit timer/event counter 0 timer output enable/disable.

TOC0 is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears TOC0 to 00H.

★

**Figure 6-4. Format of 16-Bit Timer Output Control Register 0 (TOC0)**

Address: FF63H After reset: 00H R/W

Symbol	7	6	5	4	<3>	<2>	1	<0>
TOC0	0	0	0	TOC04	LVS0	LVR0	TOC01	TOE0

TOC04	Timer output F/F control by match of CR01 and TM0	
0	Inversion operation disabled	
1	Inversion operation enabled	

LVS0	LVR0	16-bit timer/event counter 0 timer output F/F status setting
0	0	No change
0	1	Timer output F/F reset (0)
1	0	Timer output F/F set (1)
1	1	Setting prohibited

TOC01	Timer output F/F control by match of CR00 and TM0	
0	Inversion operation disabled	
1	Inversion operation enabled	

TOE0	16-bit timer/event counter 0 output control	
0	Output disabled (output set to level 0)	
1	Output enabled	

- Cautions**
1. The timer operation must be stopped before setting TOC0.
  2. If LVS0 and LVR0 are read after data is set, they will be 0.
  3. Be sure to clear bits 5 to 7 of TOC0 to 0.

**(4) Prescaler mode register 0 (PRM0)**

This register is used to set the 16-bit timer counter 0 (TM0) count clock and TI00, TI01 input valid edges. PRM0 is set by an 8-bit memory manipulation instruction.  $\overline{\text{RESET}}$  input clears PRM0 to 00H.

**Figure 6-5. Format of Prescaler Mode Register 0 (PRM0)**

Address: FF61H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
PRM0	ES11	ES10	ES01	ES00	0	0	PRM01	PRM00

ES11	ES10	TI01 valid edge selection
0	0	Falling edge
0	1	Rising edge
1	0	Setting prohibited
1	1	Both falling and rising edges

ES01	ES00	TI00 valid edge selection
0	0	Falling edge
0	1	Rising edge
1	0	Setting prohibited
1	1	Both falling and rising edges

★

PRM01	PRM00	Count clock selection
0	0	$f_x$ (12 MHz)
0	1	$f_x/2^2$ (3 MHz)
1	0	$f_x/2^6$ (187 kHz)
1	1	TI00 valid edge <sup>Notes 1, 2</sup>

- Notes**
1. The external clock requires a pulse longer than two cycles of the internal count clock ( $f_x/2^3$ ).
  2. When the valid edge of TI00 is selected, the main system clock is used as the sampling clock for noise elimination. The valid edge of TI00 can be used only when the main system clock is operating.

- Cautions**
1. Always set data to PRM0 after stopping the timer operation.
  2. If the valid edge of TI00 is to be set as the count clock, do not set the clear & start mode and the capture trigger at the valid edge of TI00. Moreover, do not use the P70/TI00/TO0 pin as a timer output (TO0).
  3. If the TI00 or TI01 pin is high level immediately after system reset, the rising edge is immediately detected after the rising edge or both the rising and falling edges are set as the valid edge(s) of the TI00 pin or TI01 pin to enable the operation of 16-bit timer counter 0 (TM0). Be careful when pulling up the TI00 pin or the TI01 pin. However, when re-enabling operation after the operation has been stopped once, the rising edge is not detected.

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. TI00, TI01: 16-bit timer/event counter 0 input pin
  3. Figures in parentheses are for operation with  $f_x = 12$  MHz.

**(5) Port mode register 7 (PM7)**

This register sets port 7 input/output in 1-bit units.

When using the P70/TO0/TI00 pin for timer output, clear PM70 and the output latch of P70 to 0.

★ When using the P70/TO0/TI00 pin for timer input, set PM70 to 1. At this time, the output latch of P70 can be either 0 or 1.

PM7 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets PM7 to FFH.

**Figure 6-6. Format of Port Mode Register 7 (PM7)**

Address: FF27H    After reset: FFH    R/W

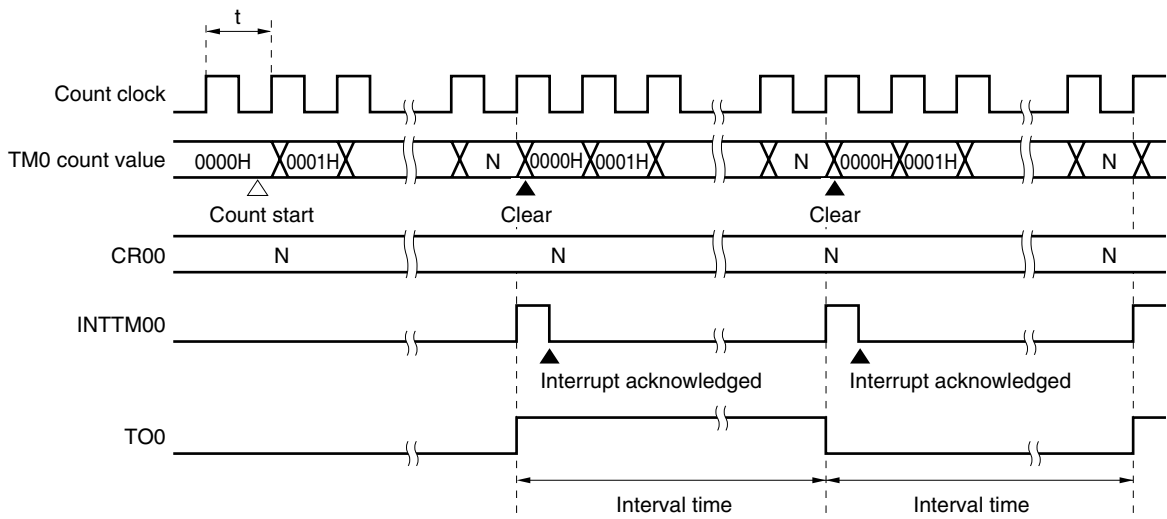

Symbol	7	6	5	4	3	2	1	0
PM7	1	1	PM75	PM74	PM73	PM72	PM71	PM70

PM7n	P7n pin I/O mode selection (n = 0 to 5)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

Figure 6-9. Timing of Interval Timer Operation

★ **Remark** Interval time =  $(N + 1) \times t$   
 $N = 0001H$  to  $FFFFH$

When the compare register is changed during timer count operation, if the value after 16-bit timer capture/compare register 00 (CR00) is changed is smaller than that of 16-bit timer counter 0 (TM0), TM0 continues counting, overflows and then restarts counting from 0. Thus, if the value (M) after the CR00 change is smaller than that (N) before the change, it is necessary to restart the timer after changing CR00.

Figure 6-10. Timing After Change of Compare Register During Timer Count Operation

**Remark**  $N > X > M$

**6.4.2 Operation as external event counter**

The external event counter counts the number of external clock pulses to be input to the TI00/TO0/P70 pin with using 16-bit timer counter 0 (TM0).

TM0 is incremented each time the valid edge specified by prescaler mode register 0 (PRM0) is input.

When the TM0 count value matches the 16-bit timer capture/compare register 00 (CR00) value, TM0 is cleared to 0 and the interrupt request signal (INTTM00) is generated.

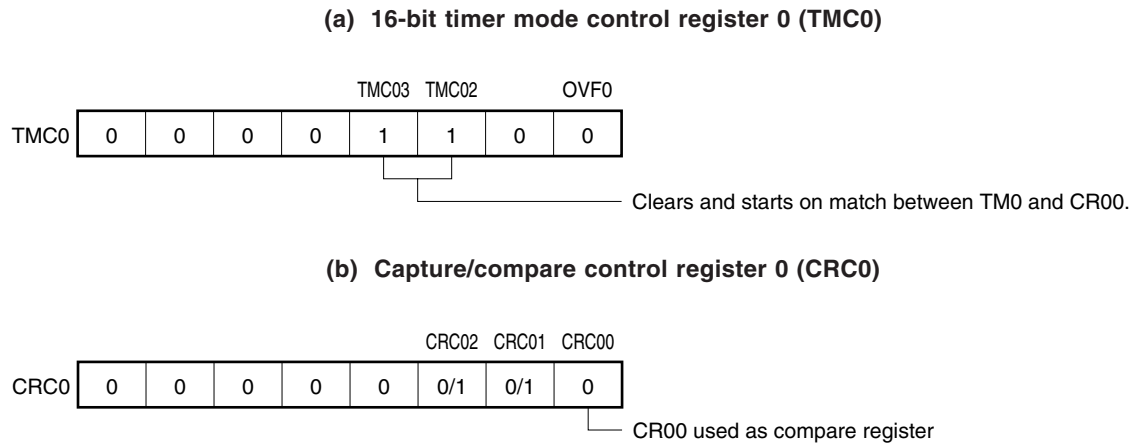

Input a value other than 0000H to CR00. (A count operation with a pulse cannot be carried out.)

The rising edge, the falling edge, or both edges can be selected using bits 4 and 5 (ES00 and ES01) of prescaler mode register 0 (PRM0).

Because an operation is carried out only when the valid edge of the TI00 pin is detected twice after sampling with the internal clock ( $f_x/2^3$ ), noise with a short pulse width can be removed.

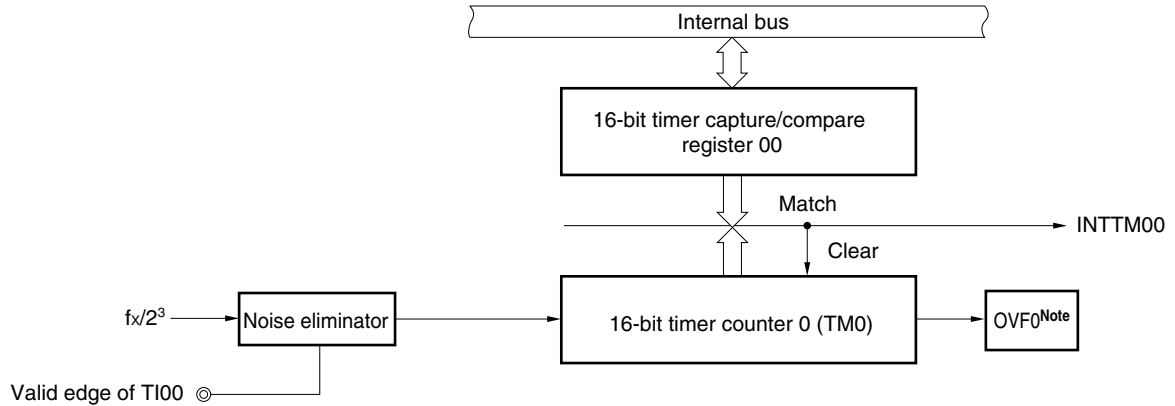

**Caution** When used as an external event counter, the P70/TI00/TO0 pin cannot be used as a timer output (TO0).

★ **Figure 6-11. Control Register Settings in External Event Counter Mode**

★

Figure 6-12. External Event Counter Configuration Diagram

**Note** OVF0 is 1 only when 16-bit timer capture/compare register 00 is set to FFFFH.

Figure 6-13. External Event Counter Operation Timing (with Rising Edge Specified)

**Caution** When reading the external event counter count value, TM0 should be read.

**6.4.3 Operation as pulse width measurement**

It is possible to measure the pulse width of the signals input to the TI00/TO0/P70 pin and TI01/P71 pin using 16-bit timer counter 0 (TM0).

There are two measurement methods: measuring with TM0 used in free-running mode, and measuring by restarting the timer in synchronization with the edge of the signal input to the TI00 pin.

**(1) Pulse width measurement with free-running counter and one capture register**

When 16-bit timer counter 0 (TM0) is operated in free-running mode (see register settings in **Figure 6-14**), and the edge specified by prescaler mode register 0 (PRM0) is input to the TI00 pin, the value of TM0 is taken into 16-bit timer capture/compare register 01 (CR01) and an external interrupt request signal (INTTM01) is set. Any of three edges can be selected—rising, falling, or both edges—specified by bits 4 and 5 (ES00 and ES01) of PRM0.

Sampling is performed with the count clock selected by PRM0, and a capture operation is only performed when a valid level of the TI00 pin is detected twice, thus eliminating noise with a short pulse width.

★ **Figure 6-14. Control Register Settings for Pulse Width Measurement with Free-Running Counter and One Capture Register**

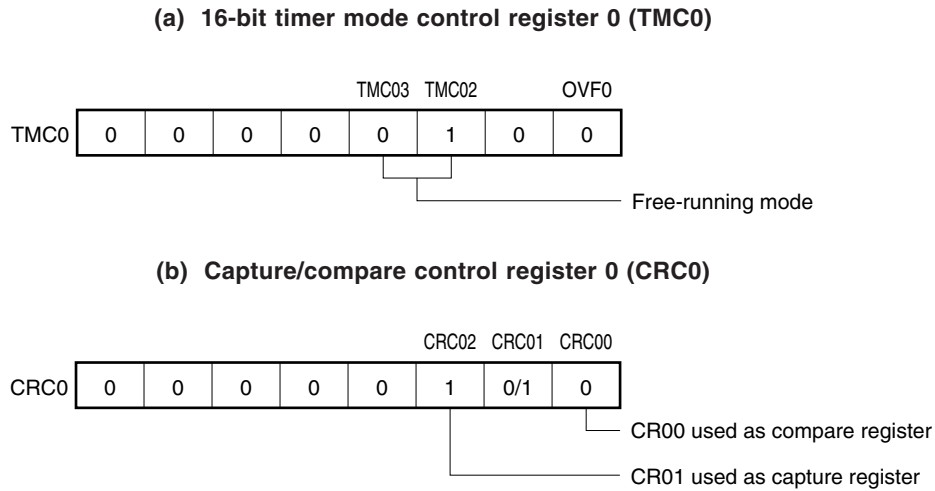

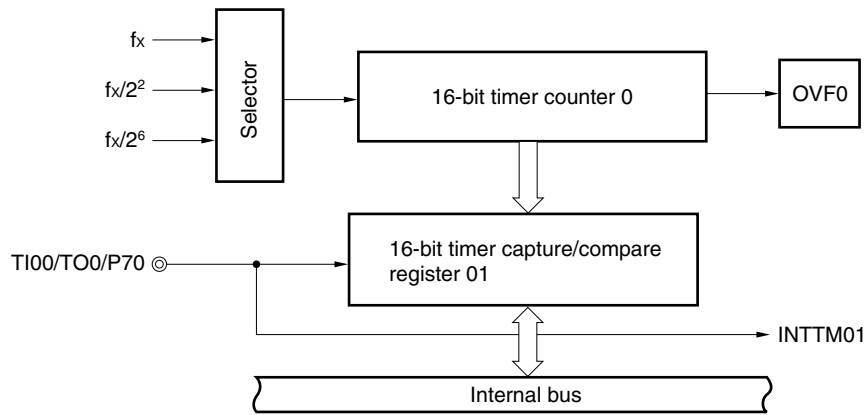

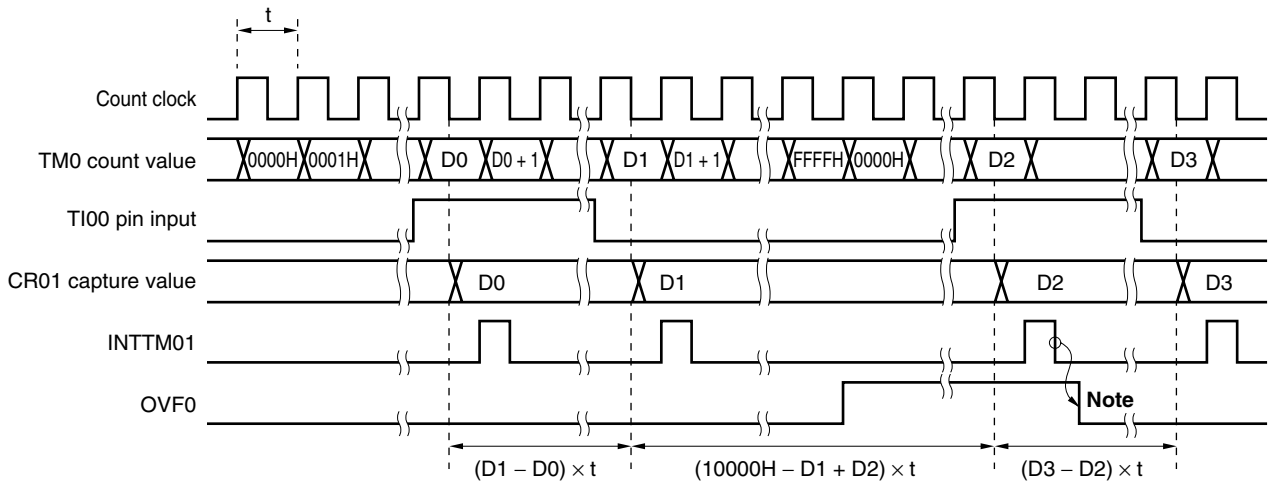

Figure 6-15. Configuration Diagram for Pulse Width Measurement with Free-Running Counter

★ Figure 6-16. Timing of Pulse Width Measurement Operation with Free-Running Counter and One Capture Register (with Both Edges Specified)

**Note** OVFO must be cleared by software.

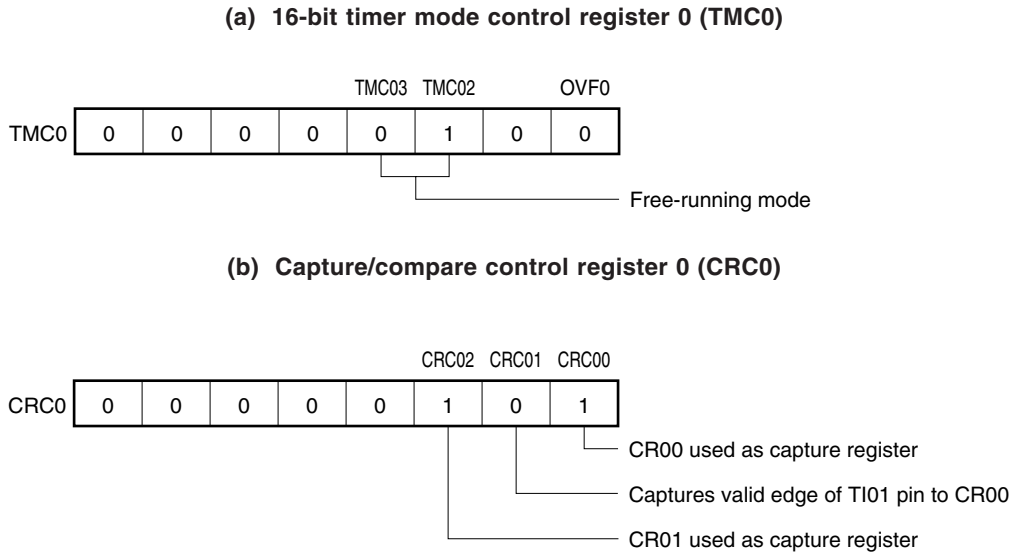

**(2) Measurement of two pulse widths with free-running counter**

When 16-bit timer counter 0 (TM0) is operated in free-running mode (see register settings in **Figure 6-17**), it is possible to simultaneously measure the pulse widths of the two signals input to the TI00 pin and the TI01 pin. When the edge specified by bits 4 and 5 (ES00 and ES01) of prescaler mode register 0 (PRM0) is input to the TI00 pin, the value of TM0 is taken into 16-bit timer capture/compare register 01 (CR01) and an interrupt request signal (INTTM01) is set.

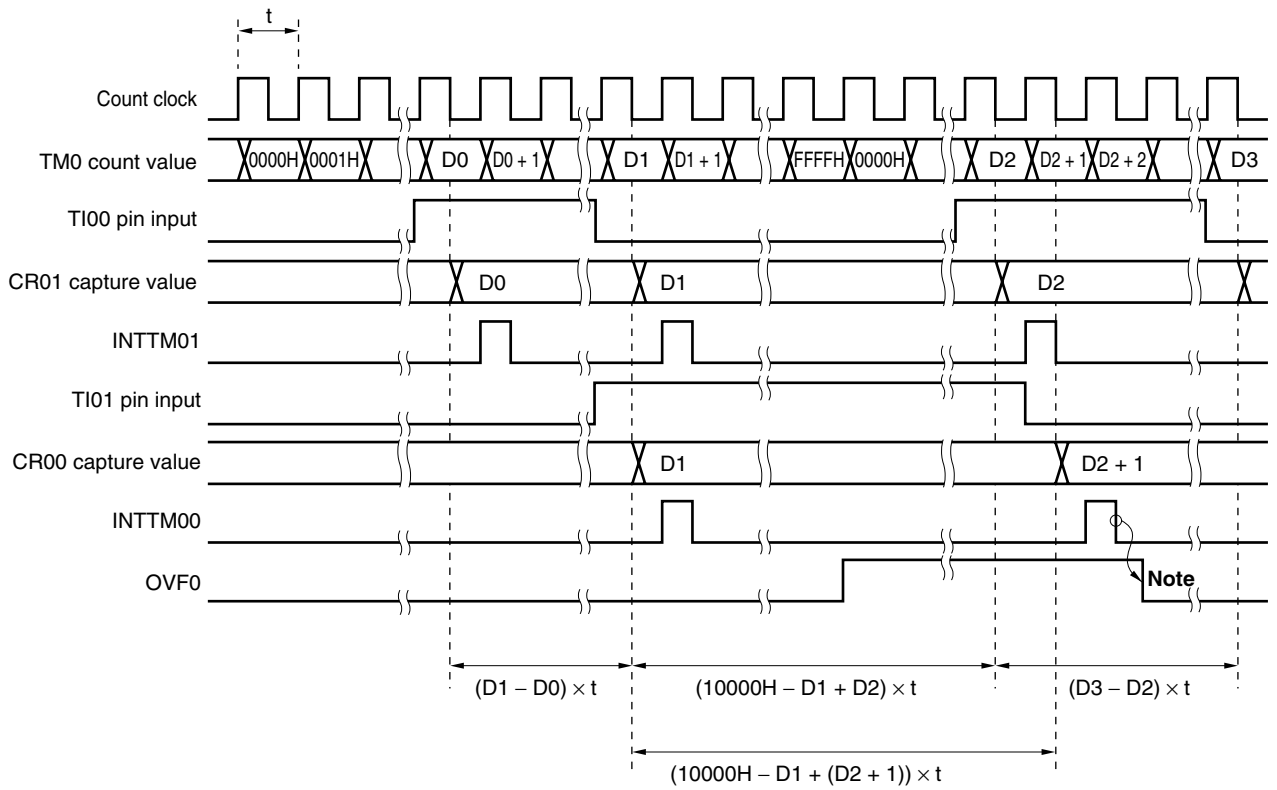

Also, when the edge specified by bits 6 and 7 (ES10 and ES11) of PRM0 is input to the TI01 pin, the value of TM0 is taken into 16-bit timer capture/compare register 00 (CR00) and an interrupt request signal (INTTM00) is set.

Any of three edges can be selected—rising, falling, or both edges—as the valid edges for the TI00 pin and the TI01 pin specified by bits 4 and 5 (ES00 and ES01) and bits 6 and 7 (ES10 and ES11) of PRM0, respectively. Sampling is performed at the interval selected by prescaler mode register 0 (PRM0), and a capture operation is only performed when a valid level of the TI00 pin or TI01 pin is detected twice, thus eliminating noise with a short pulse width.

★ **Figure 6-17. Control Register Settings for Measurement of Two Pulse Widths with Free-Running Counter**

★ **Figure 6-18. Timing of Pulse Width Measurement Operation with Free-Running Counter (with Both Edges Specified)**

**Note** OVFO must be cleared by software.

**(3) Pulse width measurement with free-running counter and two capture registers**

When 16-bit timer counter 0 (TM0) is operated in free-running mode (see register settings in **Figure 6-19**), it is possible to measure the pulse width of the signal input to the TI00 pin.

When the edge specified by bits 4 and 5 (ES00 and ES01) of prescaler mode register 0 (PRM0) is input to the TI00 pin, the value of TM0 is taken into 16-bit timer capture/compare register 01 (CR01) and an interrupt request signal (INTTM01) is set.

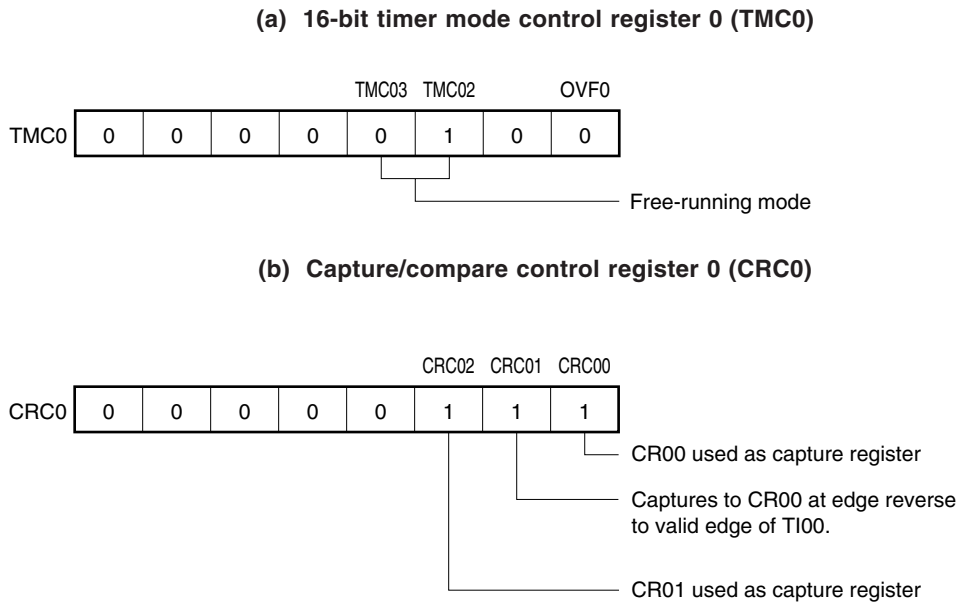

Also, when the inverse edge to that of the capture operation to CR01 is input, the value of TM0 is taken into 16-bit timer capture/compare register 00 (CR00).

Either of two edges can be selected—rising or falling—as the valid edges for the TI00 pin specified by bits 4 and 5 (ES00 and ES01) of prescaler mode register 0 (PRM0).

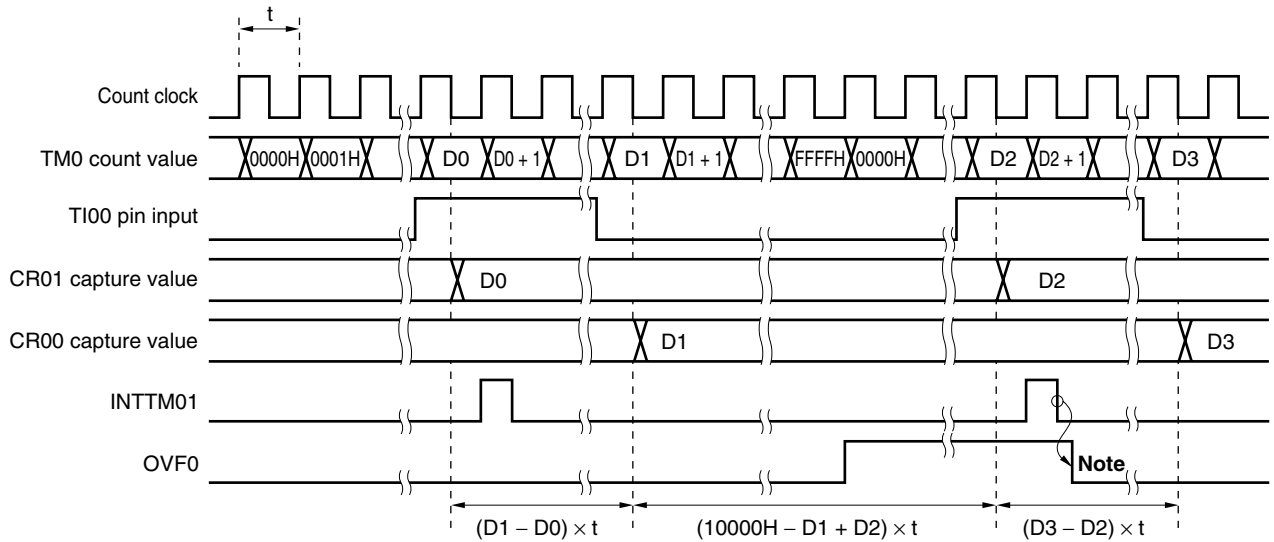

Sampling is performed at the interval selected by prescaler mode register 0 (PRM0), and a capture operation is only performed when a valid level of the TI00 pin is detected twice, thus eliminating noise with a short pulse width.

**Caution** If the valid edge of TI00 is specified to be both the rising and falling edges, 16-bit timer capture/compare register 00 (CR00) cannot perform the capture operation.

★ **Figure 6-19. Control Register Settings for Pulse Width Measurement with Free-Running Counter and Two Capture Registers**

★ **Figure 6-20. Timing of Pulse Width Measurement Operation with Free-Running Counter and Two Capture Registers (with Rising Edge Specified)**

**Note** OVFO must be cleared by software.

#### (4) Pulse width measurement by means of restart

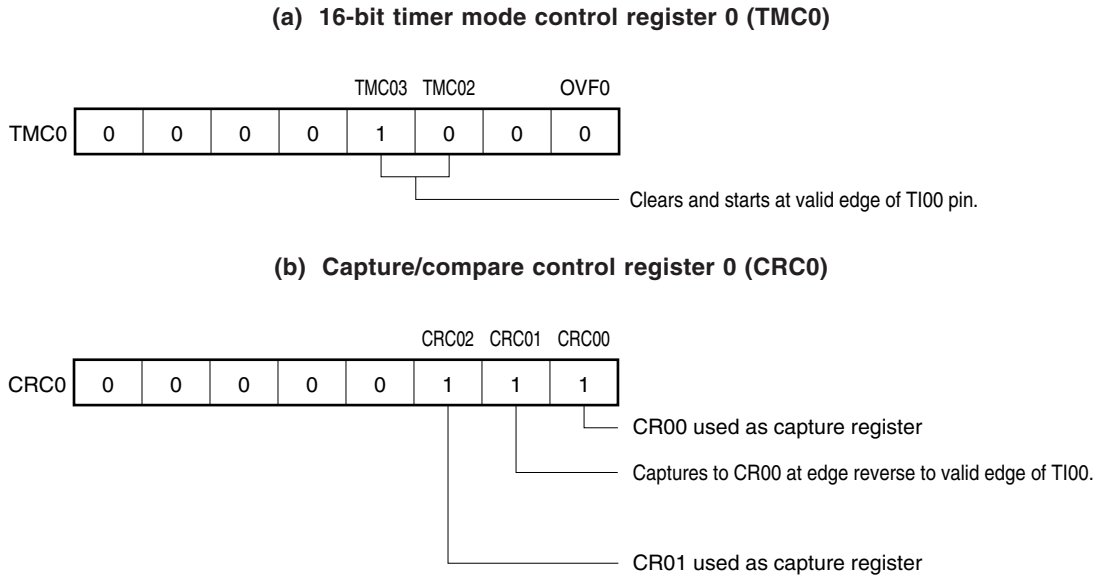

When input of a valid edge to the TI00 pin is detected, the count value of 16-bit timer counter 0 (TM0) is taken into 16-bit timer capture/compare register 01 (CR01), and then the pulse width of the signal input to the TI00 pin is measured by clearing TM0 and restarting the count (see register settings in **Figure 6-22**).

The edge specification can be selected from two types, rising or falling edges, by bits 4 and 5 (ES00 and ES01) of prescaler mode register 0 (PRM0).

Sampling is performed at the interval selected by prescaler mode register 0 (PRM0) and a capture operation is only performed when a valid level of the TI00 pin is detected twice, thus eliminating noise with a short pulse width.

**Caution** If the valid edge of TI00 is specified to be both the rising and falling edges, 16-bit timer capture/compare register 00 (CR00) cannot perform the capture operation.

★ **Figure 6-21. Control Register Settings for Pulse Width Measurement by Means of Restart**

★ **Figure 6-22. Timing of Pulse Width Measurement Operation by Means of Restart (with Rising Edge Specified)**

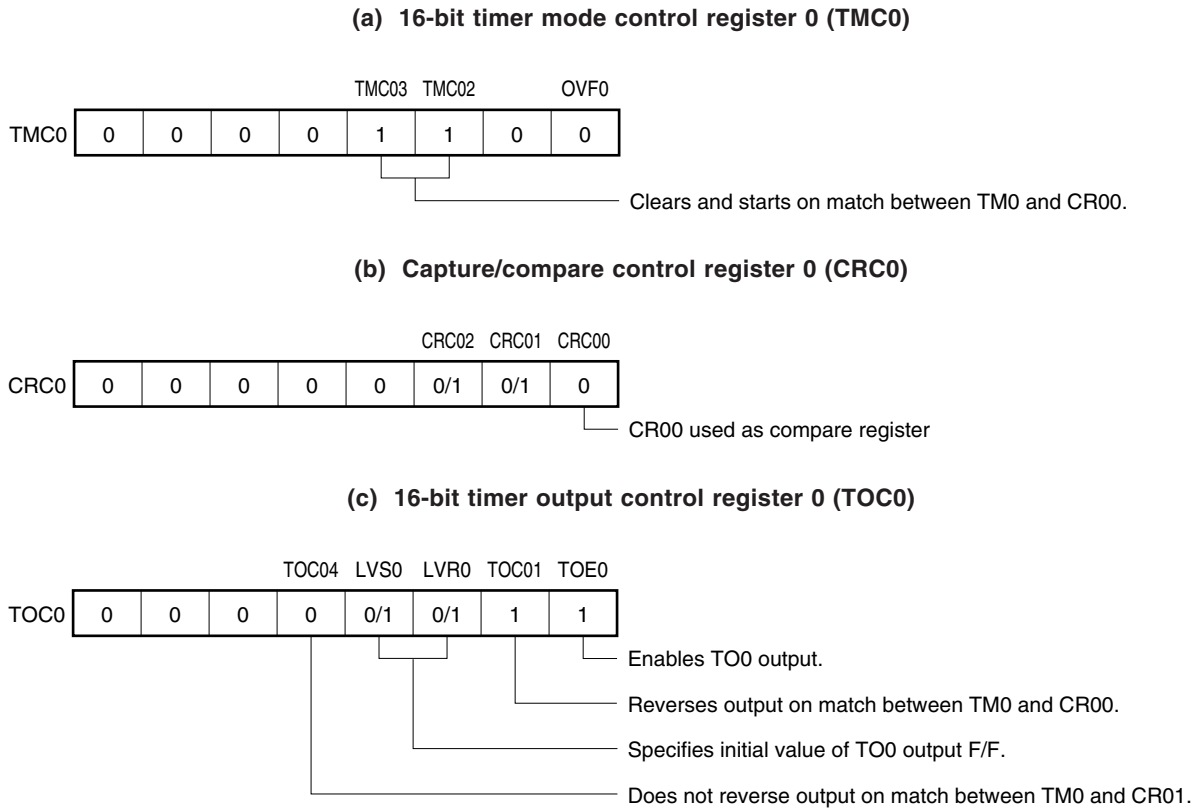

**6.4.4 Operation as square-wave output**

A square wave with any selected frequency can be output at intervals determined by the count value preset to 16-bit timer capture/compare register 00 (CR00).

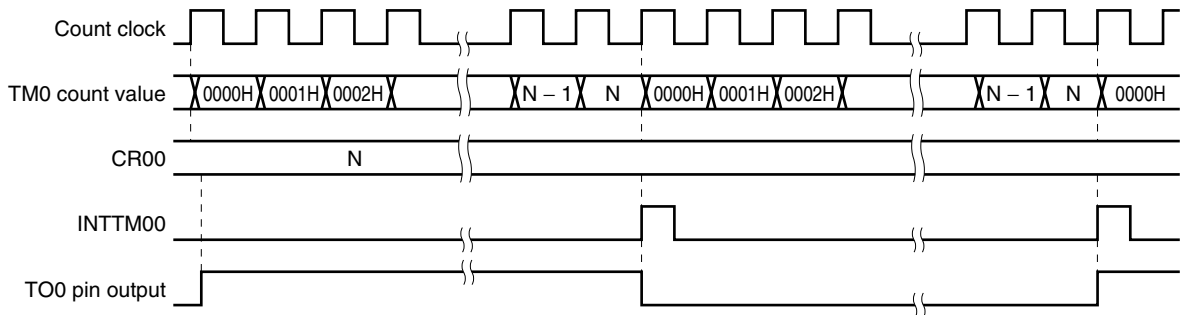

The TO0 pin output status is reversed at intervals determined by the count value preset to CR00 by setting bit 0 (TOE0) and bit 1 (TOC01) of 16-bit timer output control register 0 (TOC0) to 1. This enables a square wave with any selected frequency to be output.

★

**Figure 6-23. Control Register Settings in Square-Wave Output Mode**

**Figure 6-24. Square-Wave Output Operation Timing**

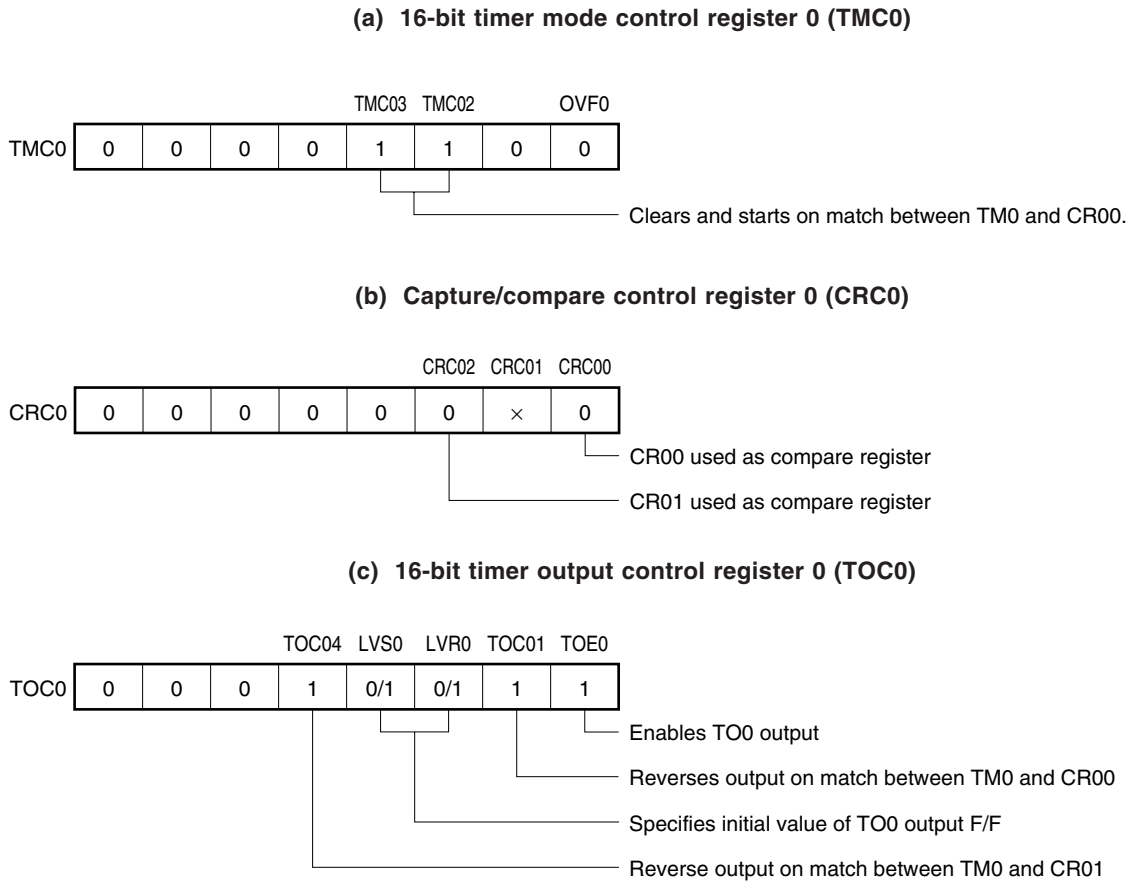

6.4.5 Operation as PPG output

Setting 16-bit timer mode control register 0 (TMC0) and capture/compare control register 0 (CRC0) as shown in Figure 6-25 allows operation as PPG (Programmable Pulse Generator) output.

In the PPG output operation, square waves are output from the TO0 pin with the pulse width and the cycle that correspond to the count values set beforehand in 16-bit timer capture/compare register 01 (CR01) and in 16-bit timer capture/compare register 00 (CR00), respectively.

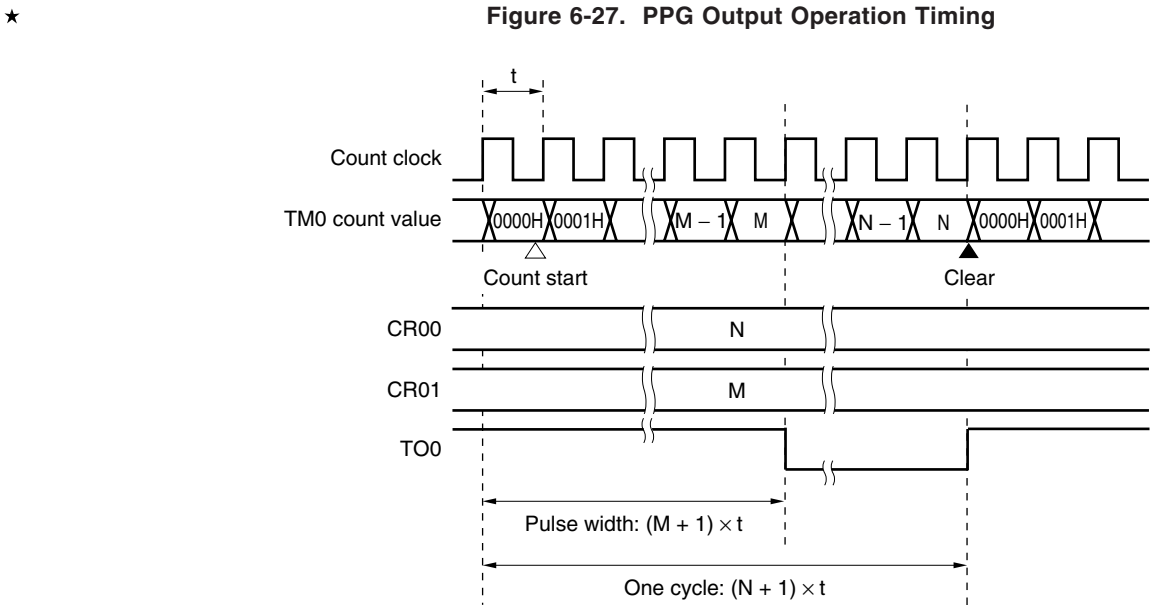

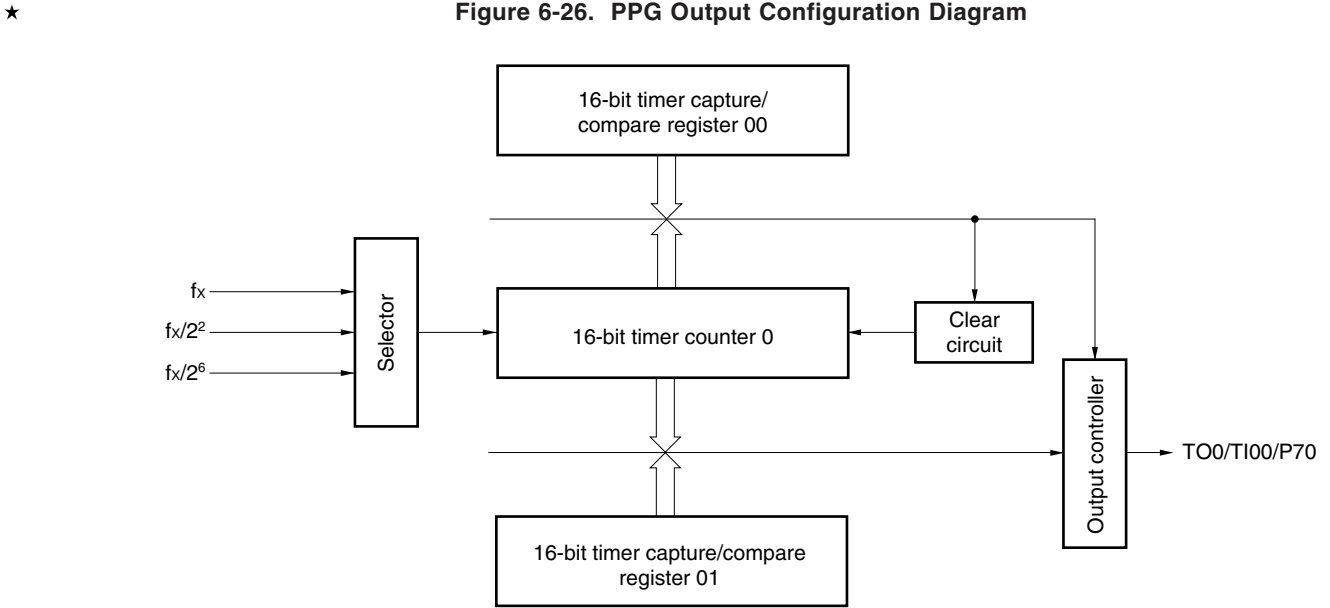

★ **Figure 6-25. Control Register Settings for PPG Output Operation**

- Cautions**
1. CR00 and CR01 values in the following range should be set to:  
 $0000H < CR01 < CR00 \leq FFFFH$
  2. The cycle of the pulse generated via PPG output (CR00 setting value + 1) has a duty of (CR01 setting value + 1)/(CR00 setting value + 1).

**Remark** ×: Don't care

**Remark** 0000H < M < N ≤ FFFFH

**★ 6.5 Program List**

**Caution** The following sample program is shown as an example to describe the operation of semiconductor products and their applications. Therefore, when applying the following information to your devices, design the devices after performing evaluation under your own responsibility.

## 6.5.1 Interval timer

```

/*****
/*
/*      Setting example of timer 0 interval timer mode
/*      Cycle set to 130 as intervalTM0 (at 8.38 MHz for 1 ms)
/*      Variable ppgdata prepared as rewrite data area
/*      : Cycle (if 0000, no change)
/*      ppgdata to be checked at every INTTM00, and changed if required.
/*      Therefore, if change is required, set the change data in ppgdata.
/*      When changed, ppgdata cleared to 0000.
/*
/*****

    }
}

```

6.6 Cautions for 16-Bit Timer/Event Counter 0

(1) Timer start errors

An error of up to one clock may occur in the time required for a match signal to be generated after timer start. This is because 16-bit timer counter 0 (TM0) is started asynchronously to the count clock.

Figure 6-28. Start Timing of 16-Bit Timer Counter 0 (TM0)

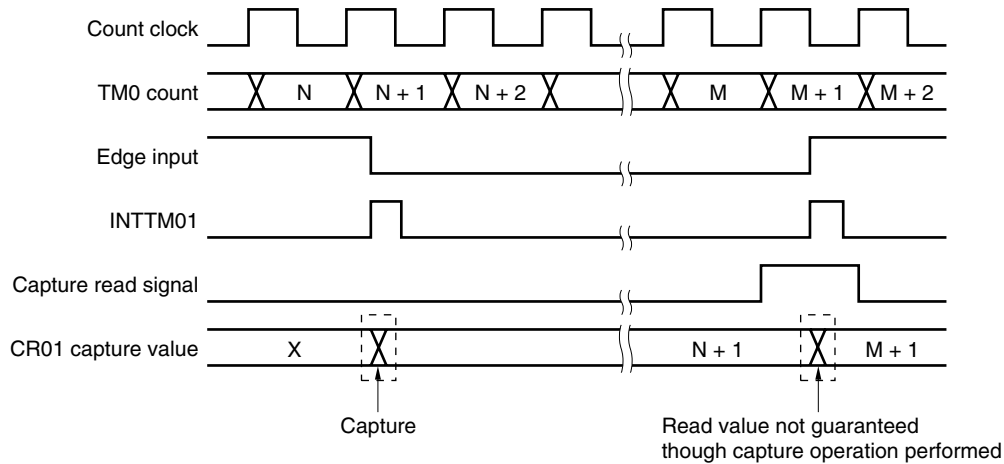

(2) 16-bit timer capture/compare register setting (clear & start mode entered on match between TM0 and CR00)

Set 16-bit timer capture/compare registers 00, 01 (CR00, CR01) to other than 0000H. This means a 1-pulse count operation cannot be performed.

★ (3) Capture register data retention timing

If the valid edge of the TI00 pin is input during 16-bit timer capture/compare register 01 (CR01) read, CR01 performs a capture operation but, the read value at this time is not guaranteed. The interrupt request signal (INTTM01) is generated upon detection of the valid edge.

Figure 6-29. Capture Register Data Retention Timing

(4) Valid edge setting

Set the valid edge of the TI00 pin after clearing bits 2 and 3 (TMC02 and TMC03) of 16-bit timer mode control register 0 (TMC0) to 0, 0, respectively, and then stopping the timer operation. The valid edge is set by bits 4 and 5 (ES00 and ES01) of prescaler mode register 0 (PRM0).

**(5) Operation of OVF0 flag**

<1> The OVF0 flag is also set to 1 in the following case.

- ★ Either of the clear & start mode entered on a match between TM0 and CR00, clear & start at the valid edge of TI00, or free-running mode is selected.

↓

CR00 is set to FFFFH.

↓

When TM0 is counted up from FFFFH to 0000H.

**Figure 6-30. Operation Timing of OVF0 Flag**

<2> Even if the OVF0 flag is cleared before the next count clock is counted (before TM0 becomes 0001H) after the occurrence of a TM0 overflow, the OVF0 flag is reset newly and clear is disabled.

**(6) Conflicting operations**

When the 16-bit timer capture/compare register (CR00/CR01) is used as a compare register, if the write period and the match timing of 16-bit timer counter 0 (TM0) conflict, match determination is not successfully done. Do not perform a write operation of CR00/CR01 near the match timing.

**(7) Timer operation**

- <1> Even if 16-bit timer counter 0 (TM0) is read, the value is not captured by 16-bit timer capture/compare register 01 (CR01).
- <2> Regardless of the CPU's operation mode, when the timer stops, the signals input to pins TI00/TI01 are not acknowledged.

**(8) Capture operation**

- <1> If TI00 is specified as the valid edge of the count clock, a capture operation by the capture register specified as the trigger for TI00 is not possible.
- <2> If both the rising and falling edges are selected as the valid edges of TI00, capture is not performed.
- <3> To ensure the reliability of the capture operation, the capture trigger requires a pulse longer than two cycles of the count clock selected by prescaler mode register 0 (PRM0).

**Figure 6-31. CR01 Capture Operation with Rising Edge Specified**

- <4> The capture operation is performed at the fall of the count clock. An interrupt request input (INTTM0n), however, occurs at the rise of the next count clock.

**Remark** n = 0 or 1

**(9) Compare operation**

- <1> When the 16-bit timer capture/compare register (CR00/CR01) is overwritten during timer operation, match interrupt may be generated or the clear operation may not be performed normally if that value is close to or large than the timer value.
- <2> The capture operation may not be performed for CR00/CR01 set in compare mode even if a capture trigger is input.

**(10) Edge detection**

- <1> If the TI00 pin or the TI01 pin is high level immediately after system reset and the rising edge or both the rising and falling edges are specified as the valid edge for the TI00 pin or TI01 pin to enable 16-bit timer counter 0 (TM0) operation, a rising edge is detected immediately. Be careful when pulling up the TI00 pin or the TI01 pin. However, the rising edge is not detected at restart after the operation has been stopped once.
- <2> The sampling clock used to remove noise differs when a TI00 valid edge is used as the count clock and when it is used as a capture trigger. In the former case, the count clock is  $f_x/2^3$ , and in the latter case the count clock is selected by prescaler mode register 0 (PRM0). The capture operation is not performed until the valid edge is sampled and the valid level is detected twice, thus eliminating noise with a short pulse width.

**★ (11) STOP mode or main system clock stop mode setting**

Except when TI00, TI01 input is selected, stop the timer operation before setting STOP mode or main system clock stop mode; otherwise the timer may malfunction when the main system clock starts.

### 7.1 Functions of 8-Bit Timer/Event Counters 50, 51

8-bit timer/event counters 50, 51 (TM50, TM51) have the following two modes.

#### (1) Mode using 8-bit timer/event counters 50, 51 alone (discrete mode)

The timer operates as 8-bit timer/event counter 50 or 51.

It has the following functions.

<1> Interval timer

Interrupt requests are generated at the preset interval.

- Number of counts: 1 to 256

<2> External event counter

The number of pulses with high/low level widths of the signal input externally can be measured.

<3> Square-wave output

A square wave with an arbitrary frequency can be output.

- Cycle:  $(1 \times 2 \text{ to } 256 \times 2) \times \text{Cycles of count clock}$

<4> PWM output

A pulse with an arbitrary duty ratio can be output.

- Cycle: Count clock  $\times$  256
- Duty ratio: Set value of compare register/256

#### (2) Mode using cascade connection (16-bit resolution: cascade connection mode)

The timer operates as a 16-bit timer/event counter by combining two 8-bit timer/event counters.

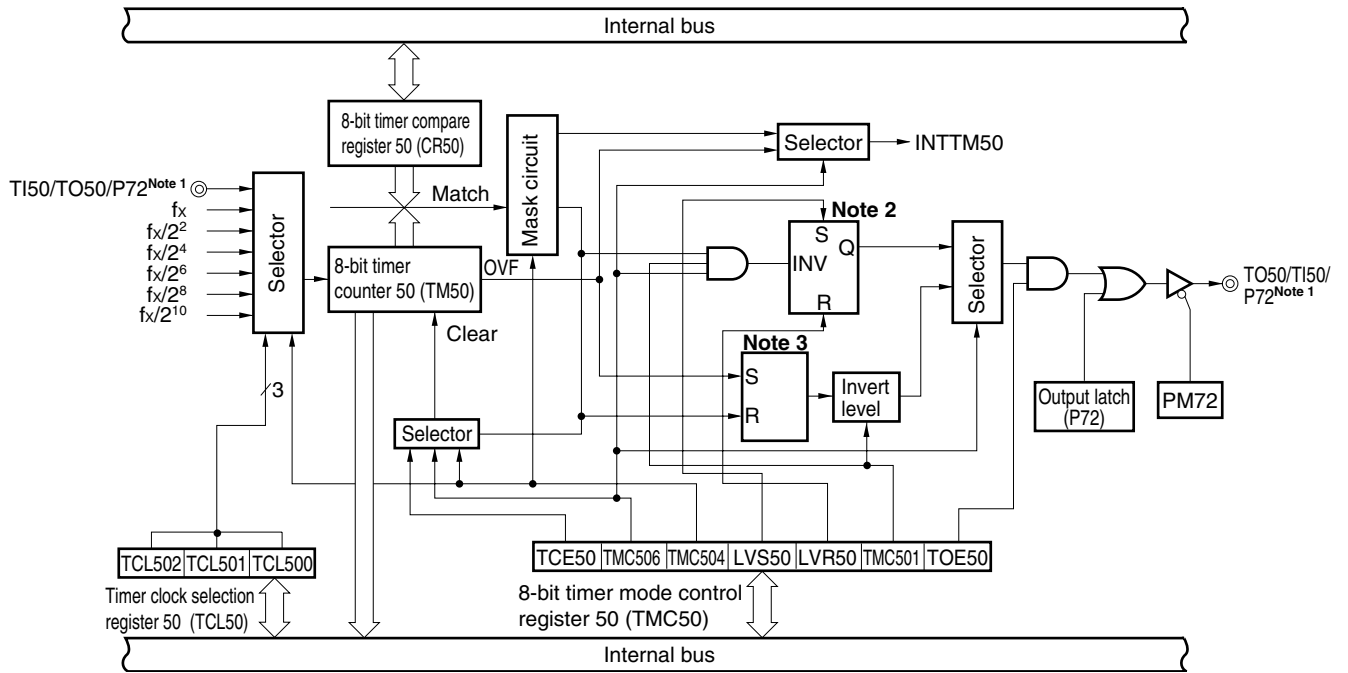

It has the following functions.

- Interval timer with 16-bit resolution
- External event counter with 16-bit resolution
- Square-wave output with 16-bit resolution

Figures 7-1 and 7-2 show diagrams of 8-bit timer/event counters 50 and 51 block.

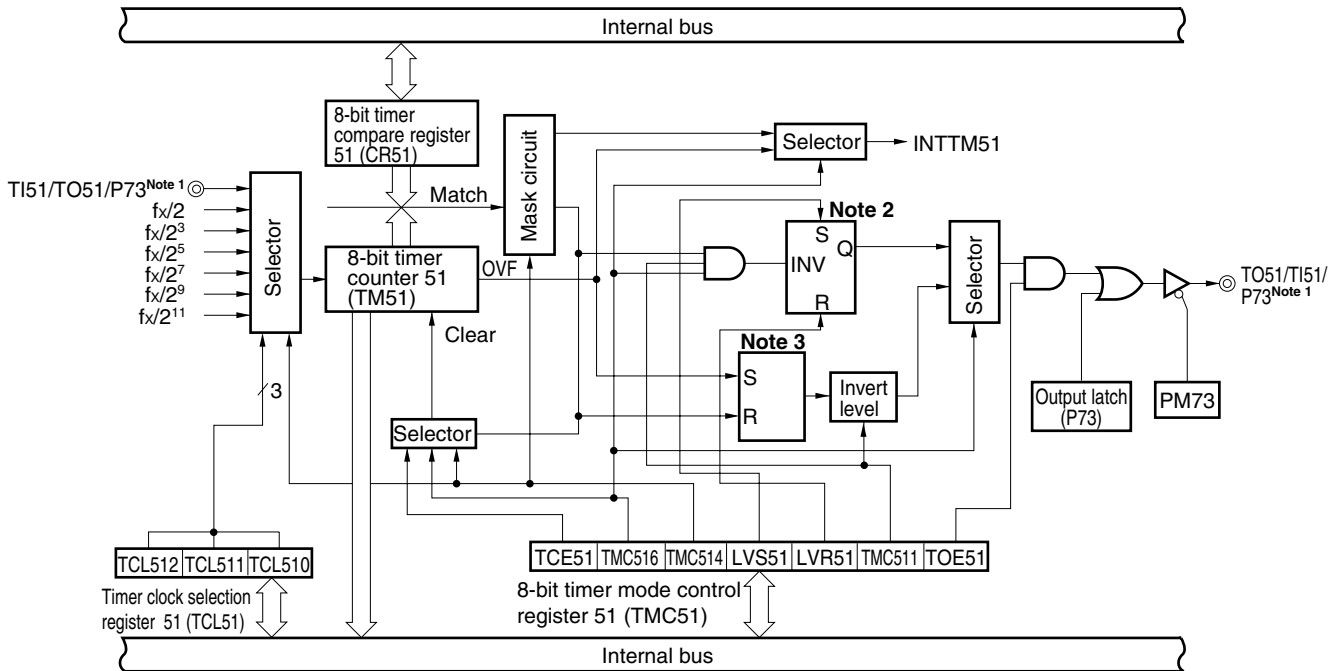

★

Figure 7-1. Block Diagram of 8-Bit Timer/Event Counter 50

★

Figure 7-2. Block Diagram of 8-Bit Timer/Event Counter 51

**Notes** 1. The respective combinations, TI50 input and TO50 output, and TI51 input and TO51 output, cannot be used at the same time.

2. Timer output F/F

3. PWM output F/F

## 7.2 Configuration of 8-Bit Timer/Event Counters 50, 51

8-bit timer/event counters 50, 51 include the following hardware.

**Table 7-1. Configuration of 8-Bit Timer/Event Counters 50, 51**

Item	Configuration
Timer counter	8-bit timer counter 5n (TM5n)
Register	8-bit timer compare register 5n (CR5n)
Timer input	TI5n
Timer output	TO5n
Control registers	Timer clock select register 5n (TCL5n) 8-bit timer mode control register 5n (TMC5n) Port mode register 7 (PM7) Port 7 (P7)

### (1) 8-bit timer counter 5n (TM5n: n = 0 or 1)

TM5n is an 8-bit read-only register that counts the count pulses.

The counter is incremented in synchronization with the rising edge of the count clock.

When TM50 and TM51 can be connected in cascade and used as a 16-bit timer, they can be read by a 16-bit memory manipulation instruction. However, since they are connected by an internal 8-bit bus, TM50 and TM51 are read separately twice in that order. Thus, take reading during the count change into consideration and compare them by reading twice. When the count value is read during operation, the count clock input is temporarily stopped<sup>Note</sup>, and then the count value is read. In the following situations, count value is set to 00H.

<1>  $\overline{\text{RESET}}$  input

<2> When TCE5n is cleared

<3> When TM5n and CR5n match in the clear & start mode entered on a match between TM5n and CR5n.

- ★ **Note** An error may occur in the count. Select a count clock that has a high/low level longer than two cycles of the CPU clock.

**Caution** In cascade connection mode, the count value is reset to 0000H when TCE50 of the lowest timer is cleared.

### (2) 8-bit timer compare register 5n (CR5n: n = 0 or 1)

When CR5n is used as a compare register in other than PWM mode, the value set in CR5n is constantly compared with the 8-bit timer counter (TM5n) count value, and an interrupt request (INTTM5n) is generated if they match.

- ★ In PWM mode, the TO5n pin goes to the active level by the overflow of TM5n. When the values of TM5n and CR5n match, the TO5n pin goes to the inactive level.

It is possible to rewrite the value of CR5n within 00H to FFH during a count operation.

When TM50 and TM51 can be connected in cascade and used as a 16-bit timer, CR50 and CR51 operate as a 16-bit compare register. This register compares the count value with the register value, and if the values match, an interrupt request (INTTM50) is generated. The INTTM51 interrupt request is also generated at this time. Thus, mask the INTTM51 interrupt request. Set CR5n using an 8-bit memory manipulation instruction. CR5n is undefined when  $\overline{\text{RESET}}$  is input.

**Caution** In cascade connection mode, stop the timer operation before setting data.

**Remark** n = 0 or 1

### 7.3 Registers Controlling 8-Bit Timer/Event Counters 50, 51

The following four registers are used to control 8-bit timer/event counters 50, 51.

- Timer clock select register 5n (TCL5n)
- 8-bit timer mode control register 5n (TMC5n)
- Port mode register 7 (PM7)
- Port 7 (P7)

**Remark** n = 0 or 1

**(1) Timer clock select register 5n (TCL5n: n = 0, 1)**

This register sets the count clock of 8-bit timer/event counter 5n and the valid edge of TI50, TI51 input. TCL5n is set by an 8-bit memory manipulation instruction.  $\overline{\text{RESET}}$  input clears TCL5n to 00H.

**Figure 7-3. Format of Timer Clock Select Register 50 (TCL50)**

Address: FF71H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
TCL50	0	0	0	0	0	TCL502	TCL501	TCL500

★

TCL502	TCL501	TCL500	Count clock selection
0	0	0	TI50 falling edge
0	0	1	TI50 rising edge
0	1	0	$f_x$ (12 MHz)
0	1	1	$f_x/2^2$ (3 MHz)
1	0	0	$f_x/2^4$ (750 kHz)
1	0	1	$f_x/2^6$ (187 kHz)
1	1	0	$f_x/2^8$ (46.8 kHz)
1	1	1	$f_x/2^{10}$ (11.7 kHz)

**Cautions** 1. When rewriting TCL50 to other data, stop the timer operation beforehand.

2. Be sure to set bits 3 to 7 to 0.

★ **Remarks** 1. When cascade connection is used, only TCL50 is valid for count clock setting.

2.  $f_x$ : Main system clock oscillation frequency

3. Figures in parentheses are for operation with  $f_x = 12$  MHz.

Figure 7-4. Format of Timer Clock Select Register 51 (TCL51)

1	1	0	$f_x/2^9$ (23.4 kHz)
1	1	1	$f_x/2^{11}$ (5.85 kHz)

- Cautions**
1. When rewriting TCL51 to other data, stop the timer operation beforehand.
  2. Be sure to set bits 3 to 7 to 0.

- ★ **Remarks**
1. When cascade connection is used, only TCL50 is valid for count clock setting.
  2.  $f_x$ : Main system clock oscillation frequency
  3. Figures in parentheses are for operation with  $f_x = 12$  MHz.

## (2) 8-bit timer mode control register 5n (TMC5n: n = 0, 1)

TMC5n is a register that makes the following six settings.

- <1> 8-bit timer counter 5n (TM5n) count operation control
- <2> 8-bit timer counter 5n (TM5n) operating mode selection
- <3> Discrete mode/cascade connection mode selection (TMC51 only)
- <4> Timer output F/F (flip flop) status setting
- <5> Active level selection in timer F/F control or PWM (free-running) mode.
- <6> Timer output control

TMC5n is set by a 1-bit or 8-bit memory manipulation instruction.  
 RESET input clears TMC5n to 00H.

Figure 7-5. Format of 8-Bit Timer Mode Control Register 50 (TMC50)

Address: FF70H After reset: 00H R/W

Symbol <7> 6 5 4 <3> <2> 1 <0>

	Timer F/F control	Active level selection
0	Inversion operation disabled	Active high
1	Inversion operation enabled	Active low

TOE50	Timer output control
0	Output disabled (port mode)
1	Output enabled

- Remarks**
1. In PWM mode, PWM output will be inactive because TCE50 = 0.
  2. If LVS50 and LVR50 are read after data is set, 0 is read.

Figure 7-6. Format of 8-Bit Timer Mode Control Register 51 (TMC51)

Address: FF78H After reset: 00H R/W

Symbol <7> 6 5 4 <3> <2> 1 <0>

TMC51	TCE51	TMC516	0	TMC514	LVS51	LVR51	TMC511	TOE51
-------	-------	--------	---	--------	-------	-------	--------	-------

TCE51	TM51 count operation control
0	After clearing to 0, count operation disabled (prescaler disabled)
1	Count operation start

TMC516	TM51 operating mode selection
0	Clear and start mode by match between TM51 and CR51
1	PWM (free-running) mode

TMC514	Discrete mode/cascade connection mode selection
0	Discrete mode
1	Cascade connection mode (TM50: Lower timer, TM51: Higher timer)

LVS51	LVR51	Timer output F/F status setting
0	0	No change
0	1	Timer output F/F reset (0)
1	0	Timer output F/F set (1)
1	1	Setting prohibited

TMC511	In other modes (TMC516 = 0)	In PWM mode (TMC516 = 1)
	Timer F/F control	Active level selection
0	Inversion operation disabled	Active high
1	Inversion operation enabled	Active low

TOE51	Timer output control
0	Output disabled (port mode)
1	Output enabled

- Remarks**
1. In PWM mode, PWM output will be inactive because TCE51 = 0.
  2. If LVS51 and LVR51 are read after data is set, 0 is read.

**(3) Port mode register 7 (PM7)**

This register sets port 7 input/output in 1-bit units.

When using the P72/TO50/TI50 and P73/TI51/TO51 pins for timer output, set PM72, PM73, and the output latches of P72 and P73 to 0.

★ When using the P72/TO50/TI50 and P73/TI51/TO51 pins as timer input, set PM72 and PM73 to 1. At this time, the output latches of P72 and P73 may be either 0 or 1.

PM7 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets PM7 to FFH.

**Figure 7-7. Format of Port Mode Register 7 (PM7)**

0	Output mode (output buffer on)
1	Input mode (output buffer off)

## 7.4 Operations of 8-Bit Timer/Event Counters 50, 51

### 7.4.1 Operation as 8-bit interval timer

The 8-bit timer/event counters operate as interval timers that generate interrupt requests repeatedly at intervals of the count value preset to 8-bit timer compare register 5n (CR5n).

When the count value of 8-bit timer counter 5n (TM5n) matches the value set to CR5n, counting continues with the TM5n value cleared to 0 and an interrupt request signal (INTTM5n) is generated.

The count clock of TM5n can be selected with bits 0 to 2 (TCL5n0 to TCL5n2) of timer clock select register 5n (TCL5n).

#### [Setting]

<1> Set the registers.

- TCL5n: Select count clock.
- CR5n: Compare value
- TMC5n: Count operation stop, clear & start mode on match between TM5n and CR5n.  
(TMC5n = 0000xxx0B x = don't care)

<2> After TCE5n = 1 is set, count operation starts.

<3> If the values of TM5n and CR5n match, the timer output flip-flop inverts. Also, INTTM5n is generated and TM5n is cleared to 00H.

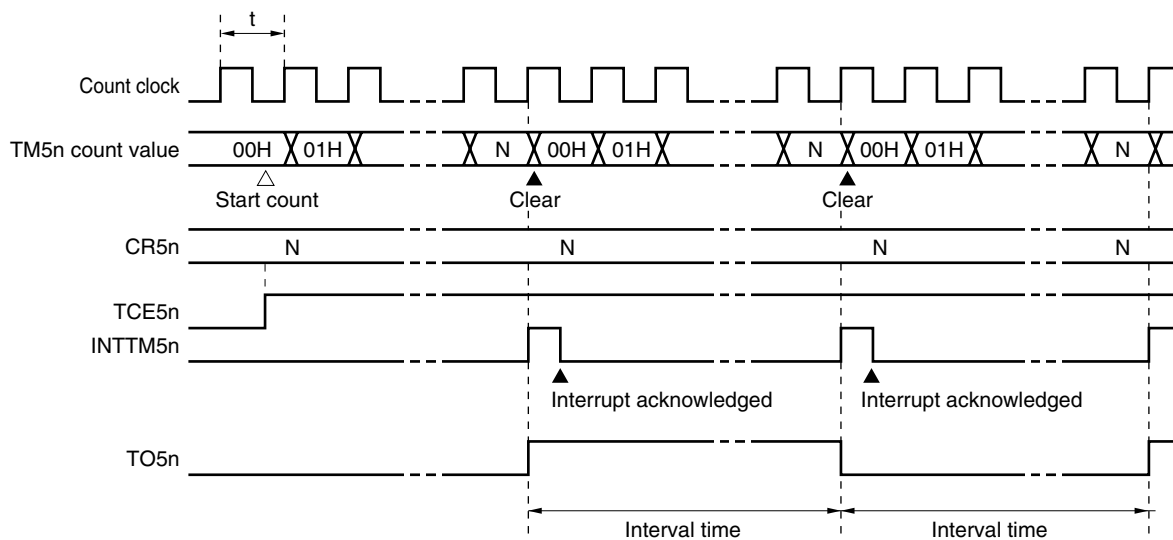

<4> INTTM5n is generated repeatedly at the same interval.

Set TCE5n to 0 to stop the count operation.

**Remark** n = 0 or 1

Figure 7-8. Interval Timer Operation Timing (1/3)

#### (a) Basic operation

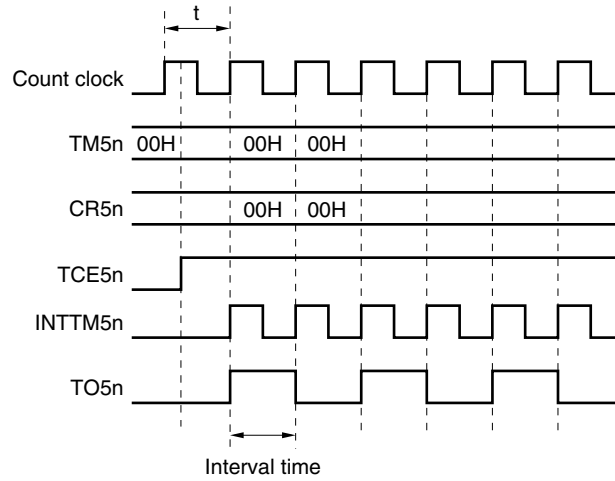

**Remarks 1.** Interval time =  $(N + 1) \times t$

N = 00H to FFH

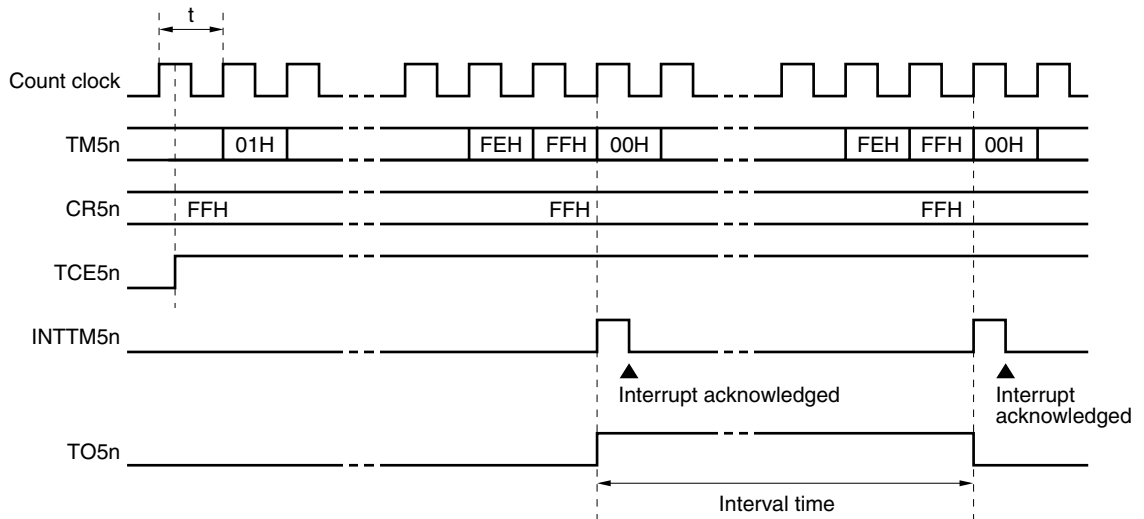

2. n = 0 or 1

Figure 7-8. Interval Timer Operation Timing (2/3)

(b) When CR5n = 00H

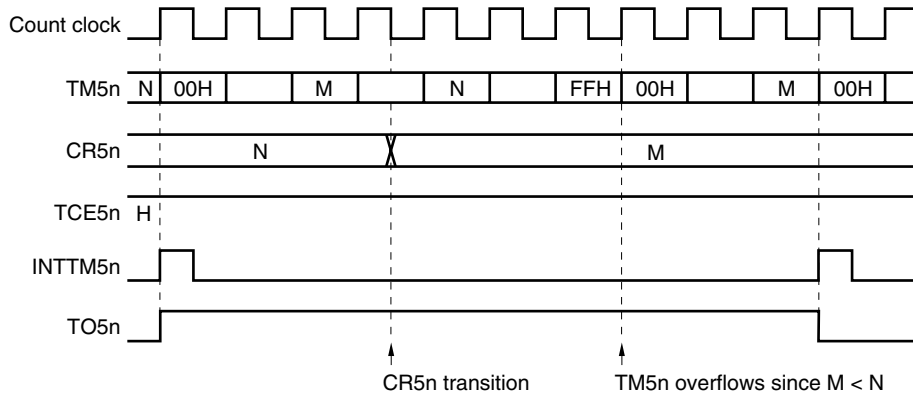

(c) When CR5n = FFH

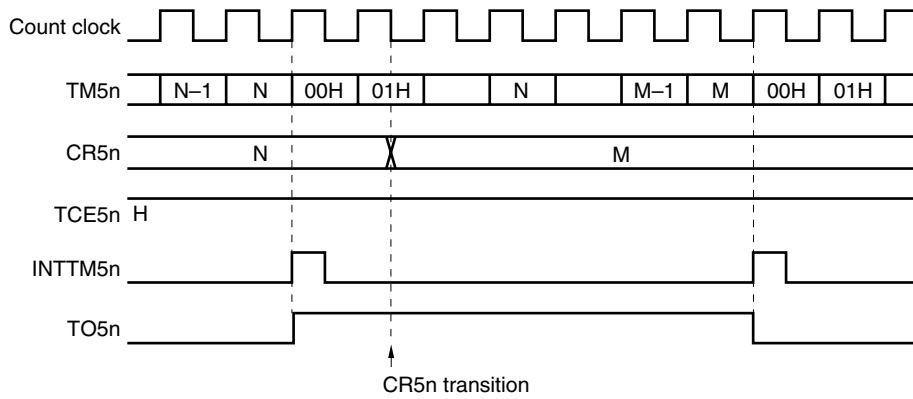

**Remark** n = 0 or 1

Figure 7-8. Interval Timer Operation Timing (3/3)

(d) Operated by CR5n transition ( $M < N$ )

(e) Operated by CR5n transition ( $M > N$ )

**Remark**  $n = 0$  or  $1$

### 7.4.2 Operation as external event counter

The external event counter counts the number of external clock pulses to be input to TI5n using 8-bit timer counter 5n (TM5n).

TM5n is incremented each time the valid edge specified by timer clock select register 5n (TCL5n) is input. Either the rising or falling edge can be selected.

When the TM5n count value matches the value of 8-bit timer compare register 5n (CR5n), TM5n is cleared to 0 and an interrupt request signal (INTTM5n) is generated.

Whenever the TM5n count value matches the value of CR5n, INTTM5n is generated.

★

#### [Setting]

<1> Set each register.

- TCL5n: Edge selection of TI5n input  
Rising edge of TI5n → TCL5n = 00H  
Falling edge of TI5n → TCL5n = 01H
- CR5n: Compare value
- TMC5n: Count operation stop, clear & start mode on match between TM5n and CR5n, timer F/F inverted operation disable, timer output disable  
(TMC5n = 0000 ××00B, × = don't care)

<2> When TCE5n = 1 is set, the number of pulses input from TI5n is counted.

<3> When the values of TM5n and CR5n match, INTTM5n is generated (TM5n is cleared to 00H).

<4> Each time the values of TM5n and CR5n match, INTTM5n is generated.

**Figure 7-9. External Event Counter Operation Timing (with Rising Edge Specified)**

**Remarks 1.** N = 00H to FFH

**2.** n = 0 or 1

### 7.4.3 Operation as square-wave output (8-bit resolution)

A square wave with any selected frequency is output at intervals determined by the value preset to 8-bit timer compare register 5n (CR5n).

The TO5n pin output status is reversed at intervals determined by the count value preset to CR5n by setting bit 0 (TOE5n) of 8-bit timer mode control register 5n (TMC5n) to 1. This enables a square wave with any selected frequency to be output (duty = 50%).

#### [Setting]

<1> Set each register.

- Set port latches (P72, P73)<sup>Note</sup> and port mode registers (PM72, PM73)<sup>Note</sup> to 0.
- TCL5n: Select count clock
- CR5n: Compare value
- TMC5n: Count operation stop, clear & start mode on match between TM5n and CR5n

LVS5n	LVR5n	Timer Output F/F Status Setting
1	0	High-level output
0	1	Low-level output

Timer output F/F reverse enable

Timer output enable → TOE5n = 1

(TMC5n = 00001011B or 00000111B)

★

<2> After TCE5n = 1 is set, the count operation starts.

<3> Timer output F/F is reversed by match between TM5n and CR5n. After INTTM5n is generated, TM5n is cleared to 00H.

<4> Timer output F/F is reversed at the same interval and a square wave is output from TO5n.

★

The frequency is as follows.

- Frequency =  $f_{CNT}/2(N + 1)$   
(N = 00H to FFH,  $f_{CNT}$ : Count clock)

**Note** 8-bit timer/event counter 50: P72, PM72

8-bit timer/event counter 51: P73, PM73

Figure 7-10. Square-Wave Output Operation Timing

**Note** The TO5n output initial value can be set by bits 2 and 3 (LVR5n, LVS5n) of 8-bit timer mode control register 5n (TMC5n).

- Remarks**
1. N = 00H to FFH
  2. n = 0 or 1

#### 7.4.4 Operation as 8-bit PWM output

The 8-bit timer/event counter operates as PWM output when bit 6 (TMC5n6) of 8-bit timer mode control register 5n (TMC5n) is set to 1.

The duty ratio pulse is determined by the value set to 8-bit timer compare register 5n (CR5n).

Set the active level width of the PWM pulse to CR5n. The active level can be selected with bit 1 of TMC5n (TMC5n1).

The count clock can be selected with bits 0 to 2 (TCL5n0 to TCL5n2) of timer clock select register 5n (TCL5n).

PWM output enable/disable can be selected with bit 0 of TMC5n (TOE5n).

- ★ • Frequency = Count clock × 256
- ★ • Duty ratio =  $\frac{\text{Set value of compare register}}{256}$

**Caution** CR5n can be rewritten in PWM mode only once per cycle.

**Remark** n = 0 or 1

**(1) PWM output basic operation**★ **[Setting]**

<1> Set each register.

- Set port latches (P72, P73)<sup>Note</sup>, port mode registers (PM72, PM73)<sup>Note</sup> to 0.
- TCL5n: Count clock selection
- CR5n: Compare value
- TMC5n: Count operation stop, PWM mode selection, timer output F/F not changed

TMC5n1	Active Level Selection
0	Active high
1	Active low

Timer output enabled

(TMC5n = 01000001B or 01000011B)

<2> When TCE5n = 1 is set, the count operation is started.  
To stop the count operation, set TCE5n to 0.

**Note** 8-bit timer/event counter 50: P72, PM72  
8-bit timer/event counter 51: P73, PM73

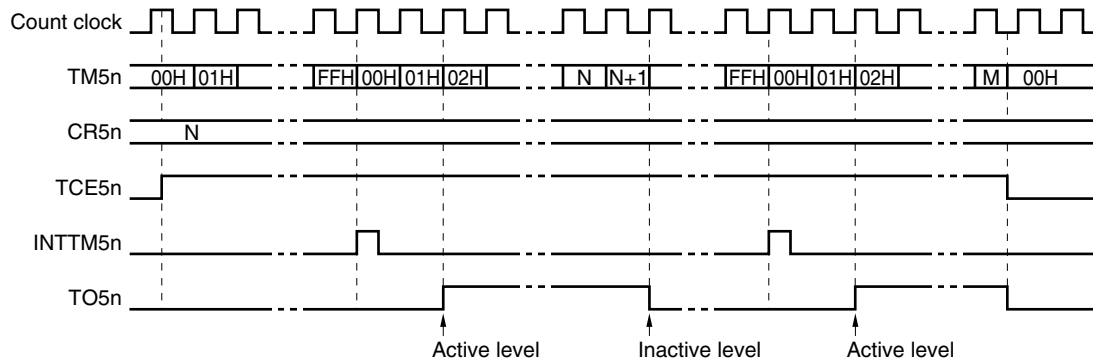

**[PWM output operation]**

- <1> PWM output (output from TO5n) outputs an inactive level after the count operation starts until an overflow occurs.
- <2> When an overflow occurs, the active level is output.  
The active level is output until CR5n matches the count value of 8-bit timer counter 5n (TM5n).
- <3> After CR5n matches the count value, PWM output outputs the inactive level again until an overflow occurs.
- <4> Operations <2> and <3> are repeated until the count operation stops.
- <5> When the count operation is stopped by setting TCE5n = 0, PWM output becomes the inactive level.

**Remark** n = 0 or 1

Figure 7-11. PWM Output Operation Timing

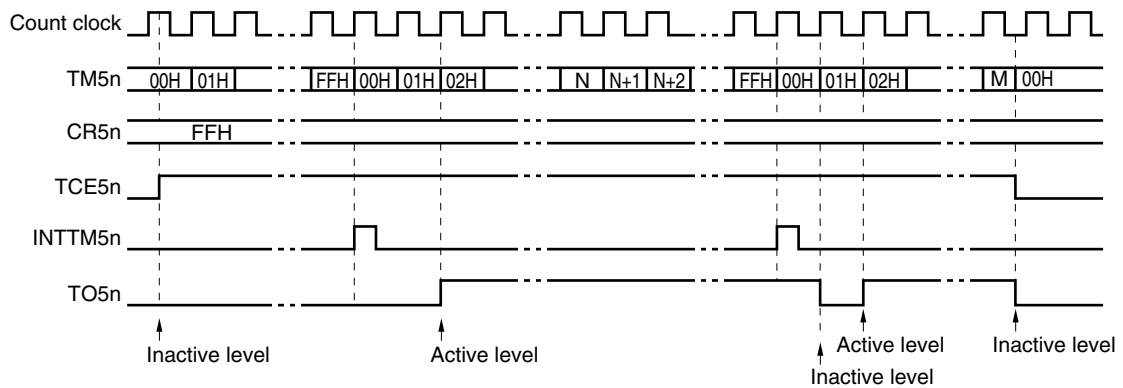

(a) Basic operation (active level = H)

(b) CR5n = 0

(c) CR5n = FFH

**Remark** n = 0 or 1

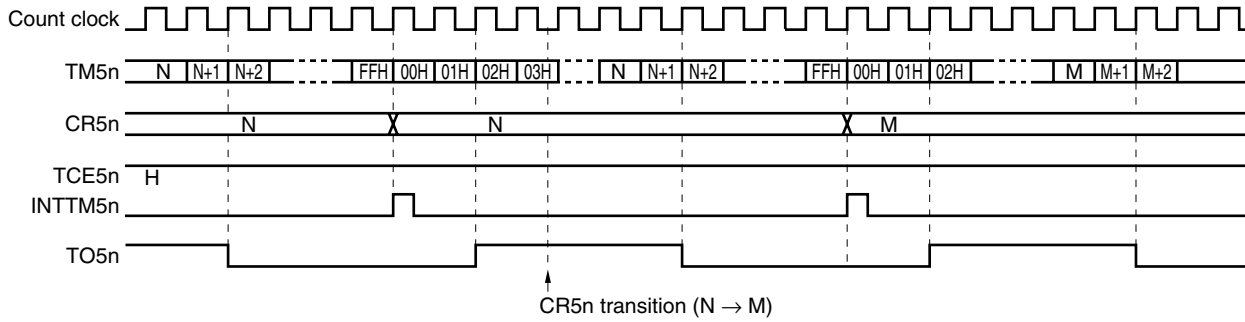

(2) Operated by CR5n transition

Figure 7-12. Timing of Operation by Change of CR5n

(a) CR5n value is changed from N to M when  $TM5n > CR5n$

(b) CR5n value is changed from N to M when  $TM5n < CR5n$

**Remark** n = 0 or 1

**7.4.5 Operation as interval timer (16-bit)**

When bit 4 (TMC514) of 8-bit timer mode control register 51 (TMC51) is set to 1, the 16-bit resolution timer/counter mode is entered.

The 8-bit timer/event counter operates as an interval timer that generates interrupt requests repeatedly at intervals of the count value preset to the 8-bit timer compare registers (CR50, CR51).

**[Setting]**

<1> Set each register.

TCL50: Select count clock for TM50.

Cascade-connected TM51 need not be selected.

CR50, CR51: Compare value (each value can be set to 00H to FFH)

TMC50, TMC51: Select the clear & start mode entered on a match between TM50 and CR50 (TM51 and CR51).

TM50 → TMC50 = 0000xxx0B x: don't care  
 TM51 → TMC51 = 0001xxx0B x: don't care

<2> When TMC51 is set to TCE51 = 1 and then TCE50 is set to TCE50 = 1, the count operation starts.

<3> When the values of TM50 and CR50 of the cascade-connected timer match, INTTM50 of TM50 is generated (TM50 and TM51 are cleared to 00H).

<4> INTTM50 is generated repeatedly at the same interval.

- Cautions**
1. Stop the timer operation without fail before setting the compare registers (CR50, CR51).
  2. INTTM51 of TM51 is generated when the TM51 count value matches CR51, even if cascade connection is used. Be sure to mask TM51 to disable interrupts.
  3. Set TCE50 and TCE51 in order of TM51 then TM50.
  4. Count restart/stop can only be controlled by setting TCE50 of TM50 to 1/0.

Figure 7-13 shows an example of 16-bit resolution cascade connection mode timing.

**Figure 7-13. 16-Bit Resolution Cascade Connection Mode**

## ★ 7.5 Program List

**Caution** The following sample program is shown as an example to describe the operation of semiconductor products and their applications. Therefore, when applying the following information to your devices, design the devices after performing evaluation under your own responsibility.

        }
    }
}

```

## 7.6 Cautions for 8-Bit Timer/Event Counters 50, 51

### (1) Timer start errors

An error of up to one clock may occur in the time required for a match signal to be generated after timer start. This is because 8-bit timer counter 5n (TM5n) is started asynchronously to the count pulse.

**Figure 7-14. Start Timing of 8-Bit Timer/Counter 5n (TM5n)**

### (2) Setting STOP mode or main system clock stop mode

Except when TI5n input is selected, always set TCE5n = 0 before setting the STOP mode or main system clock stop mode.

The timer may malfunction when the main system clock starts oscillating.

### (3) TM5n (n = 0 or 1) reading during timer operation

When reading TM5n during operation, the count clock stops temporarily, so select a count clock with a high/low-level waveform longer than two cycles of the CPU clock. For example, in the case where the CPU clock ( $f_{CPU}$ ) is  $f_x$ , when the selected count clock is  $f_x/4$  or below, it can be read.

**Remark** n = 0 or 1

## CHAPTER 8 WATCH TIMER

### 8.1 Functions of Watch Timer

The watch timer has the following functions.

**(1) Watch timer**

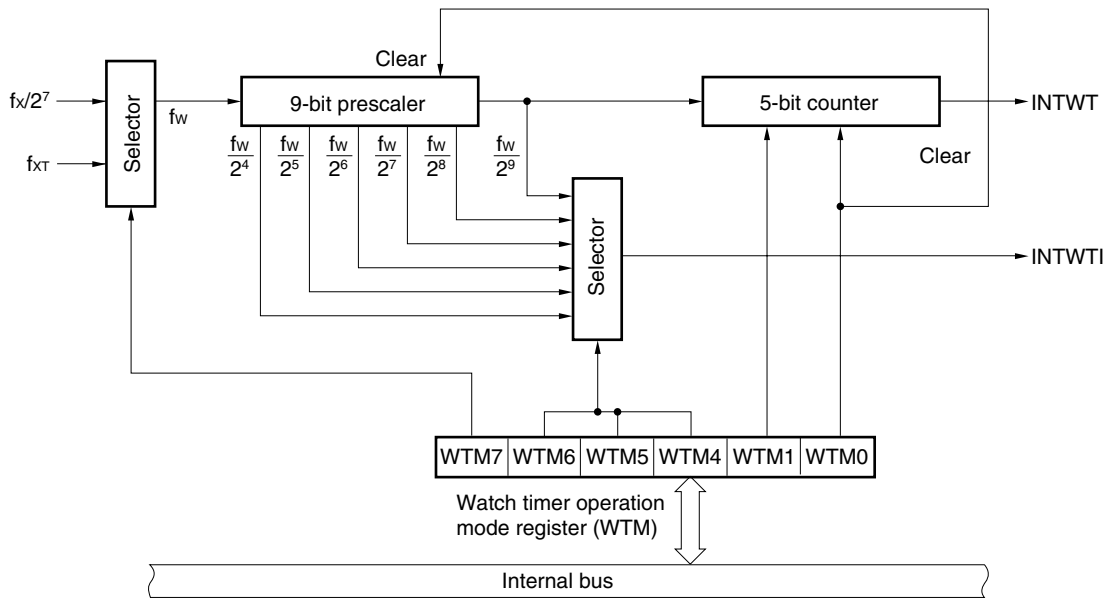

When the main system clock or subsystem clock is used, interrupt requests (INTWT) are generated at  $2^{14}/f_w$  second intervals.

**(2) Interval timer**

Interrupt requests (INTWTI) are generated at the preset time interval.  
For the interval time, refer to **Table 8-2**.

The watch timer and the interval timer can be used simultaneously.  
Figure 8-1 shows the watch timer block diagram.

**Figure 8-1. Block Diagram of Watch Timer**

**Remark**  $f_w$ : Watch timer clock frequency ( $f_x/2^7$  or  $f_{XT}$ )  
 $f_x$ : Main system clock oscillation frequency  
 $f_{XT}$ : Subsystem clock oscillation frequency

## 8.2 Configuration of Watch Timer

The watch timer includes the following hardware.

**Table 8-1. Configuration of Watch Timer**

Item	Configuration
Counter	5 bits × 1
Prescaler	9 bits × 1
Control register	Watch timer operation mode register (WTM)

### 8.3 Register Controlling Watch Timer

The watch timer operation mode register (WTM) is used to control the watch timer.

- **Watch timer operation mode register (WTM)**

This register sets the watch timer count clock, enables/disables operation, prescaler interval time, and 5-bit counter operation control.

WTM is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears WTM to 00H.

**Figure 8-2. Format of Watch Timer Operation Mode Register (WTM)**

Address: FF41H After reset: 00H R/W

Symbol	7	6	5	4	3	2	<1>	<0>
WTM	WTM7	WTM6	WTM5	WTM4	0	0	WTM1	WTM0

WTM7	Watch timer count clock selection
0	$f_x/2^7$ (93.7 kHz)
1	$f_{XT}$ (32.768 kHz)

WTM6	WTM5	WTM4	Prescaler interval time selection
0	0	0	$2^4/f_w$
0	0	1	$2^5/f_w$
0	1	0	$2^6/f_w$
0	1	1	$2^7/f_w$
1	0	0	$2^8/f_w$
1	0	1	$2^9/f_w$
Other than above			Setting prohibited

WTM1	5-bit counter operation control
0	Clear after operation stop
1	Start

WTM0	Watch timer operation enable
0	Operation stop (clear both prescaler and timer)
1	Operation enable

**Caution** Do not change the count clock and interval time (by setting bits 4 to 7 (WTM4 to WTM7) of WTM) during watch timer operation.

- Remarks**
1.  $f_w$ : Watch timer clock frequency ( $f_x/2^7$  or  $f_{XT}$ )
  2.  $f_x$ : Main system clock oscillation frequency
  3.  $f_{XT}$ : Subsystem clock oscillation frequency
  4. Figures in parentheses apply to operation with  $f_x = 12$  MHz,  $f_{XT} = 32.768$  kHz.

## 8.4 Operations of Watch Timer

### 8.4.1 Operation as watch timer

The watch timer generates an interrupt request (INTWT) at a specific time interval ( $2^{14}/f_w$  seconds) by using the main system clock or subsystem clock.

The interrupt request is generated at the following time interval.

- If main system clock (8.38 MHz) is selected: 0.25 seconds
- If subsystem clock (32.768 kHz) is selected: 0.5 seconds

When bit 0 (WTM0) and bit 1 (WTM1) of the watch timer operation mode register (WTM) are set to 1, the count operation starts. When these bits are set to 0, the 5-bit counter is cleared and the count operation stops.

When the interval timer is simultaneously operated, zero-second start can be achieved only for the watch timer by setting WTM1 to 1 after clearing it to 0. In this case, however, the 9-bit prescaler is not cleared. Therefore, an error up to  $2^9/f_w$  seconds occurs in the first overflow (INTWT) after zero-second start.

**Remark**  $f_w$ : Watch timer clock frequency ( $f_x/2^7$  or  $f_{XT}$ )

### 8.4.2 Operation as interval timer

The watch timer operates as interval timer which generates interrupt requests (INTWTI) repeatedly at an interval of the preset count value.

The interval time can be selected with bits 4 to 6 (WTM4 to WTM6) of the watch timer operation mode register (WTM).

**Table 8-2. Interval Timer Interval Time**

WTM6	WTM5	WTM4	Interval Time	When Operated at $f_x = 12 \text{ MHz}$	When Operated at $f_x = 8.38 \text{ MHz}$	When Operated at $f_x = 4.19 \text{ MHz}$	When Operated at $f_{XT} = 32.768 \text{ kHz}$
0	0	0	$2^4/f_w$	170 $\mu\text{s}$	244 $\mu\text{s}$	488 $\mu\text{s}$	488 $\mu\text{s}$
0	0	1	$2^5/f_w$	341 $\mu\text{s}$	488 $\mu\text{s}$	977 $\mu\text{s}$	976 $\mu\text{s}$
0	1	0	$2^6/f_w$	682 $\mu\text{s}$	977 $\mu\text{s}$	1.95 ms	1.95 ms
0	1	1	$2^7/f_w$	1.36 ms	1.95 ms	3.91 ms	3.90 ms
1	0	0	$2^8/f_w$	2.73 ms	3.91 ms	7.82 ms	7.81 ms
1	0	1	$2^9/f_w$	5.46 ms	7.82 ms	15.6 ms	15.6 ms
Other than above			Setting prohibited				

**Remark**  $f_x$ : Main system clock oscillation frequency  
 $f_{XT}$ : Subsystem clock oscillation frequency  
 $f_w$ : Watch timer clock frequency ( $f_x/2^7$  or  $f_{XT}$ )

Figure 8-3. Operation Timing of Watch Timer/Interval Timer

**Caution** When operation of the watch timer and 5-bit counter is enabled by the watch timer mode control register (WTM) (by setting bits 0 (WTM0) and 1 (WTM1) of WTM to 1), the interval until the first interrupt request (INTWT) is generated after the register is set does not exactly match the specification made with bit 3 (WTM3) of WTM. This is because there is a delay of one 9-bit prescaler output cycle until the 5-bit counter starts counting. Subsequently, however, the INTWT signal is generated at the specified intervals.

**Remark**  $f_w$ : Watch timer clock frequency ( $f_x/2^7$  or  $f_x T$ )  
 $n$ : The number of times of interval timer operations  
 Figures in parentheses are for operation with  $f_w = 32.768$  kHz

## CHAPTER 9 WATCHDOG TIMER

### 9.1 Functions of Watchdog Timer

The watchdog timer has the following functions.

#### (1) Watchdog timer

The watchdog timer detects a program loop. Upon detection of a program loop, a non-maskable interrupt request or  $\overline{\text{RESET}}$  can be generated.

For the loop detection time, refer to **Table 9-2**.

#### (2) Interval timer

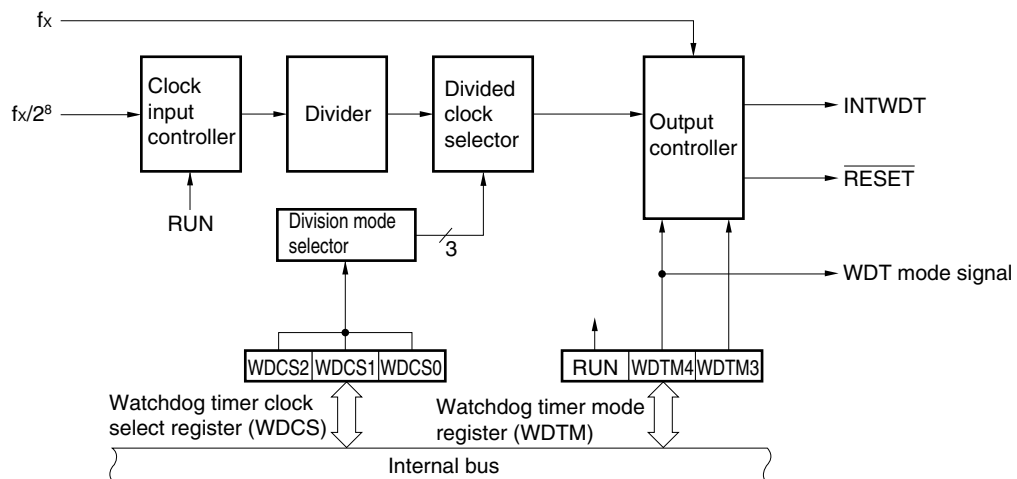

Interrupt requests are generated at the preset time intervals.

For the interval time, refer to **Table 9-3**.

**Caution** Select the watchdog timer mode or the interval timer mode using the watchdog timer mode register (WDTM). (The watchdog timer and the interval timer cannot be used simultaneously.)

Figure 9-1 shows a block diagram of the watchdog timer.

**Figure 9-1. Watchdog Timer Block Diagram**

## 9.2 Configuration of Watchdog Timer

The watchdog timer includes the following hardware.

**Table 9-1. Configuration of Watchdog Timer**

Item	Configuration
Control registers	Watchdog timer clock select register (WDCS) Watchdog timer mode register (WDTM)

## 9.3 Registers Controlling Watchdog Timer

The following two registers are used to control the watchdog timer.

- Watchdog timer clock select register (WDCS)
- Watchdog timer mode register (WDTM)

### (1) Watchdog timer clock select register (WDCS)

This register sets overflow time of the watchdog timer and the interval timer.

WDCS is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears WDCS to 00H.

**Figure 9-2. Format of Watchdog Timer Clock Select Register (WDCS)**

Address: FF42H    After reset: 00H    R/W

Symbol	7	6	5	4	3	2	1	0
WDCS	0	0	0	0	0	WDCS2	WDCS1	WDCS0

WDCS2	WDCS1	WDCS0	Overflow time of watchdog timer/interval timer
0	0	0	$2^{12}/f_x$ (341 $\mu$ s)
0	0	1	$2^{13}/f_x$ (682 $\mu$ s)
0	1	0	$2^{14}/f_x$ (1.36 ms)
0	1	1	$2^{15}/f_x$ (2.73 ms)
1	0	0	$2^{16}/f_x$ (5.46 ms)
1	0	1	$2^{17}/f_x$ (10.9 ms)
1	1	0	$2^{18}/f_x$ (21.8 ms)
1	1	1	$2^{20}/f_x$ (87.3 ms)

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. Figures in parentheses are for operation with  $f_x = 12$  MHz

**(2) Watchdog timer mode register (WDTM)**

This register sets the watchdog timer operating mode and enables/disables counting.

WDTM is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears WDTM to 00H.

**Figure 9-3. Format of Watchdog Timer Mode Register (WDTM)**

Address: FFF9H After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0
WDTM	RUN	0	0	WDTM4	WDTM3	0	0	0

RUN	Watchdog timer operation mode selection <sup>Note 1</sup>
0	Count stop
1	Counter is cleared and counting starts

WDTM4	WDTM3	Watchdog timer operation mode selection <sup>Note 2</sup>
0	×	Interval timer mode <sup>Note 3</sup> (Maskable interrupt request occurs upon generation of an overflow)
1	0	Watchdog timer mode 1 (Non-maskable interrupt request occurs upon generation of an overflow)
1	1	Watchdog timer mode 2 (Reset operation is activated upon generation of an overflow)

- Notes**
- Once set to 1, RUN cannot be cleared to 0 by software.  
Thus, once counting starts, it can only be stopped by  $\overline{\text{RESET}}$  input.
  - Once set to 1, WDTM3 and WDTM4 cannot be cleared to 0 by software.
  - The watchdog timer starts operations as the interval timer when 1 is set to RUN.

**Caution** When 1 is set to RUN so that the watchdog timer is cleared, the actual overflow time is up to  $2^8/f_x$  seconds shorter than the time set by watchdog timer clock select register (WDCS).

**Remark** ×: don't care

## 9.4 Operations of Watchdog Timer

### 9.4.1 Operation as watchdog timer

When bit 4 (WDTM4) of the watchdog timer mode register (WDTM) is set to 1, the watchdog timer is operated to detect any program loops.

The program loop detection time interval is selected with bits 0 to 2 (WDCS0 to WDCS2) of the watchdog timer clock select register (WDCS).

Watchdog timer starts by setting bit 7 (RUN) of WDTM to 1. After the watchdog timer is started, set RUN to 1 within the set program loop time interval. The watchdog timer can be cleared and counting is started by setting RUN to 1. If RUN is not set to 1 and the program loop detection time is exceeded, system reset or a non-maskable interrupt request is generated according to WDTM bit 3 (WDTM3) value.

The watchdog timer continues operating in the HALT mode but it stops in the STOP mode. Thus, set RUN to 1 before the STOP mode is set, clear the watchdog timer and then execute the STOP instruction.

- Cautions**
1. The actual program loop detection time may be shorter than the set time by a maximum of  $2^8/f_x$  seconds.
  2. When the subsystem clock is selected for CPU clock, watchdog timer count operation is stopped.

**Table 9-2. Watchdog Timer Program Loop Detection Time**

Program Loop Detection Time
$2^{12}/f_x$ (341 $\mu$ s)
$2^{13}/f_x$ (682 $\mu$ s)
$2^{14}/f_x$ (1.36 ms)
$2^{15}/f_x$ (2.73 ms)
$2^{16}/f_x$ (5.46 ms)
$2^{17}/f_x$ (10.9 ms)
$2^{18}/f_x$ (21.8 ms)
$2^{20}/f_x$ (87.3 ms)

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. Figures in parentheses are for operation with  $f_x = 12$  MHz.

### 9.4.2 Operation as interval timer

The watchdog timer operates as an interval timer which generates interrupt requests repeatedly at an interval of the preset count value when bit 4 (WDTM4) of the watchdog timer mode register (WDTM) is set to 0.

The interval time of interval timer is selected with bits 0 to 2 (WDCS0 to WDCS2) of the watchdog timer clock select register (WDCS). When 1 is set to bit 7 (RUN) of WDTM, the watchdog timer operates as the interval timer.

When the watchdog timer operated as the interval timer, the interrupt mask flag (WDTMK) and priority specify flag (WDTPR) are validated and the maskable interrupt request (INTWDT) can be generated. Among maskable interrupts, INTWDT has the highest priority at default.

The interval timer continues operating in the HALT mode but it stops in STOP mode. Thus, set RUN to 1 before the STOP mode is set, clear the interval timer and then execute the STOP instruction.

- Cautions**
1. Once bit 4 (WDTM4) of WDTM is set to 1 (this selects the watchdog timer mode), the interval timer mode is not set unless  $\overline{\text{RESET}}$  input is applied.
  2. The interval time just after setting by WDTM may be shorter than the set time by a maximum of  $2^8/f_x$  seconds.
  3. When the subsystem clock is selected for CPU clock, watchdog timer count operation is stopped.

**Table 9-3. Interval Timer Interval Time**

Interval Time
$2^{12}/f_x$ (341 $\mu\text{s}$ )
$2^{13}/f_x$ (682 $\mu\text{s}$ )
$2^{14}/f_x$ (1.36 ms)
$2^{15}/f_x$ (2.73 ms)
$2^{16}/f_x$ (5.46 ms)
$2^{17}/f_x$ (10.9 ms)
$2^{18}/f_x$ (21.8 ms)
$2^{20}/f_x$ (87.3 ms)

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. Figures in parentheses are for operation with  $f_x = 12$  MHz.

## CHAPTER 10 CLOCK OUTPUT/BUZZER OUTPUT CONTROLLER

### 10.1 Functions of Clock Output/Buzzer Output Controller

The clock output controller is intended for carrier output during remote controlled transmission and clock output for supply to peripheral ICs. The clock selected with the clock output select register (CKS) is output.

In addition, the buzzer output is intended for square wave output of buzzer frequency selected with CKS.

Figure 10-1 shows the block diagram of clock output/buzzer output controller.

★

**Figure 10-1. Block Diagram of Clock Output/Buzzer Output Controller**

## 10.2 Configuration of Clock Output/Buzzer Output Controller

The clock output/buzzer output controller includes the following hardware.

**Table 10-1. Configuration of Clock Output/Buzzer Output Controller**

Item	Configuration
Control registers	Clock output select register (CKS) Port mode register (PM7) Port 7 (P7)

## 10.3 Registers Controlling Clock Output/Buzzer Output Controller

The following three registers are used to control the clock output/buzzer output controller.

- Clock output select register (CKS)
- Port mode register (PM7)
- Port 7 (P7)

### (1) Clock output select register (CKS)

This register sets output enable/disable for clock output (PCL) and for the buzzer frequency output (BUZ), and sets the output clock.

CKS is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears CKS to 00H.

Figure 10-2. Format of Clock Output Select Register (CKS)

Address: FF40H After reset: 00H R/W

Symbol	<7>	6	5	<4>	3	2	1	0
CKS	BZOE	BCS1	BCS0	CLOE	CCS3	CCS2	CCS1	CCS0

BZOE	BUZ output enable/disable specification
0	Stop clock divider operation. BUZ fixed to low level.
1	Enable clock divider operation. BUZ output enabled.

BCS1	BCS0	BUZ output clock selection
0	0	$f_x/2^{10}$ (11.7 kHz)
0	1	$f_x/2^{11}$ (5.85 kHz)
1	0	$f_x/2^{12}$ (2.92 kHz)
1	1	$f_x/2^{13}$ (1.46 kHz)

CLOE	PCL output enable/disable specification
0	Stop clock divider operation. PCL fixed to low level.
1	Enable clock divider operation. PCL output enabled.

CCS3	CCS2	CCS1	CCS0	PCL output clock selection
0	0	0	0	$f_x$ (12 MHz)
0	0	0	1	$f_x/2$ (6 MHz)
0	0	1	0	$f_x/2^2$ (3 MHz)
0	0	1	1	$f_x/2^3$ (1.5 MHz)
0	1	0	0	$f_x/2^4$ (750 kHz)
0	1	0	1	$f_x/2^5$ (375 kHz)
0	1	1	0	$f_x/2^6$ (187 kHz)
0	1	1	1	$f_x/2^7$ (93.7 kHz)
1	0	0	0	$f_{XT}$ (32.768 kHz)
Other than above				Setting prohibited

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2.  $f_{XT}$ : Subsystem clock oscillation frequency
  3. Figures in parentheses are for operation with  $f_x = 12$  MHz or  $f_{XT} = 32.768$  kHz.

**(2) Port mode register (PM7)**

This register sets port 7 input/output in 1-bit units.

When using the P74/PCL pin for clock output and the P75/BUZ pin for buzzer output, set PM74, PM75 and the output latch of P74, P75 to 0.

PM7 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets PM7 to FFH.

**Figure 10-3. Format of Port Mode Register 7 (PM7)**

Address: FF27H    After reset: FFH    R/W

Symbol	7	6	5	4	3	2	1	0
PM7	1	1	PM75	PM74	PM73	PM72	PM71	PM70

PM7n	P7n pin I/O mode selection (n = 0 to 5)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

## 10.4 Operations of Clock Output/Buzzer Output Controller

### 10.4.1 Operation as clock output

The clock pulse is output as the following procedure.

- <1> Select the clock pulse output frequency with bits 0 to 3 (CCS0 to CCS3) of the clock output select register (CKS) (clock pulse output in disabled status).
- <2> Set bit 4 (CLOE) of CKS to 1 to enable clock output.

**Remark** The clock output controller is designed not to output pulses with a small width during output enable/disable switching of the clock output. As shown in Figure 10-4, be sure to start output from the low period of the clock (marked with \* in the figure). When stopping output, do so after securing high level of the clock.

**Figure 10-4. Remote Control Output Application Example**

### 10.4.2 Operation as buzzer output

The buzzer frequency is output as the following procedure.

- <1> Select the buzzer output frequency with bits 5 and 6 (BCS0, BCS1) of the clock output select register (CKS) (buzzer output in disabled status).
- <2> Set bit 7 (BZOE) of CKS to 1 to enable buzzer output.

## CHAPTER 11 8-BIT A/D CONVERTER ( $\mu$ PD780024AS SUBSERIES)

### 11.1 Functions of A/D Converter

A/D converter is an 8-bit resolution converter that converts analog inputs into digital values. It can control up to 4 analog input channels (ANI0 to ANI3).

#### (1) Hardware start

Conversion is started by trigger input (ADTRG: rising edge, falling edge, or both rising and falling edges can be specified).

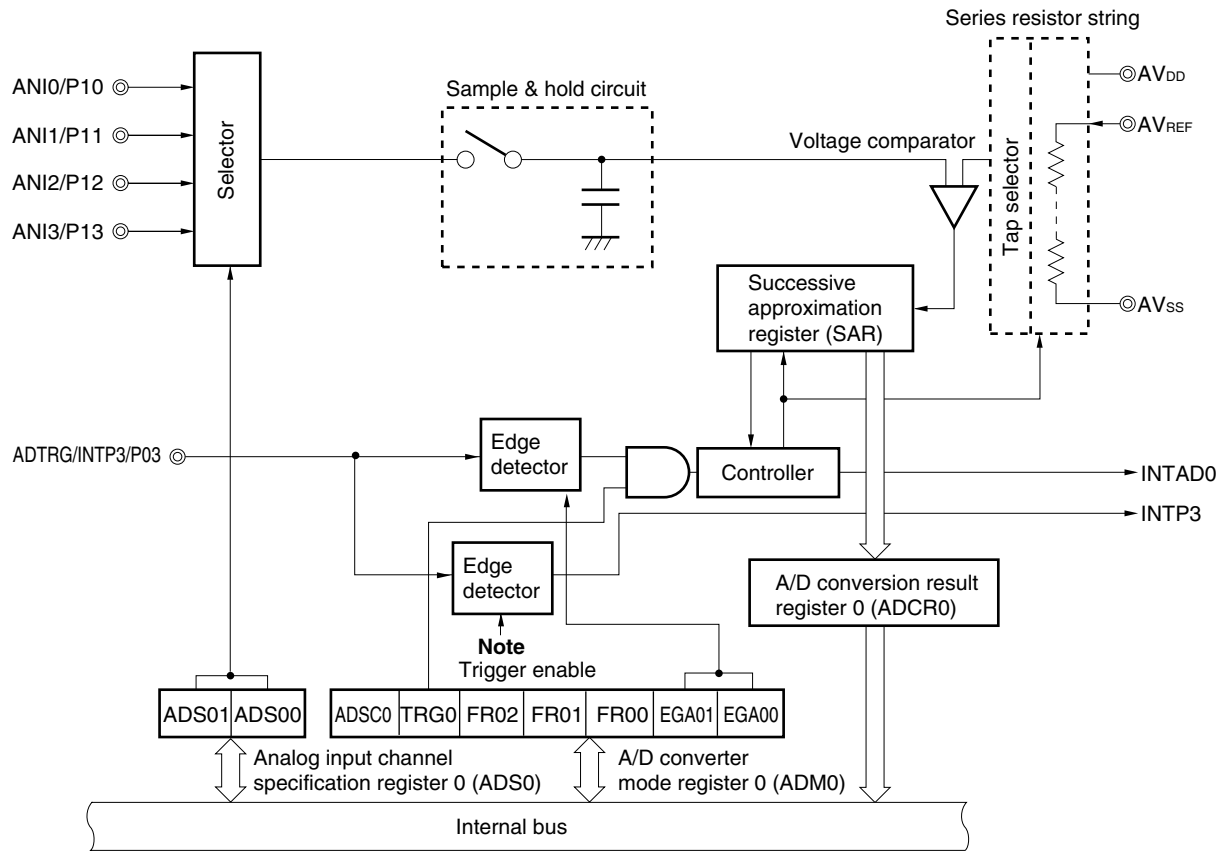

#### (2) Software start

Conversion is started by setting A/D converter mode register 0 (ADM0).

Select one channel for analog input from ANI0 to ANI3 to perform A/D conversion. In the case of hardware start, A/D conversion stops when an A/D conversion operation ends and an interrupt request (INTAD0) is generated. In the case of software start, A/D conversion is repeated. Each time an A/D conversion operation ends, an interrupt request (INTAD0) is generated.

**Caution** Although the  $\mu$ PD78F0034BS incorporate a 10-bit A/D converter, this converter can be operated as an 8-bit A/D converter by using the device file DF780024.

Figure 11-1. Block Diagram of 8-Bit A/D Converter

**Note** The valid edge of an external interrupt is specified by bit 3 of the EGP and EGN registers (see **Figure 15-5 Format of External Interrupt Rising Edge Enable Register (EGP) and External Interrupt Falling Edge Enable Register (EGN)**).

## 11.2 Configuration of A/D Converter

The A/D converter includes the following hardware.

**Table 11-1. Configuration of A/D Converter**

Item	Configuration
Analog input	4 channels (ANI0 to ANI3)
Hardware trigger input	1 (ADTRG)
Registers	Successive approximation register (SAR) A/D conversion result register 0 (ADCR0)
Control registers	A/D converter mode register 0 (ADM0) Analog input channel specification register 0 (ADS0)

### (1) Successive approximation register (SAR)

This register compares the analog input voltage value to the voltage tap (compare voltage) value applied from the series resistor string, and holds the result from the most significant bit (MSB).

When up to the least significant bit (LSB) is held (end of A/D conversion), the SAR contents are transferred to A/D conversion result register 0 (ADCR0).

### (2) A/D conversion result register 0 (ADCR0)

ADCR0 is an 8-bit register that stores the A/D conversion result. Each time A/D conversion ends, the conversion result is loaded from the successive approximation register.

ADCR0 is read by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ADCR0 to 00H.

**Caution** The contents of ADCR0 may become undefined when writing is performed to A/D converter mode register 0 (ADM0) and analog input channel specification register 0 (ADS0). Read the conversion result following conversion completion before writing to ADM0 or ADS0. Using a timing other than the above may cause an incorrect conversion result to be read.

### ★ (3) Sample & hold circuit

The sample & hold circuit samples the input signal of the analog input pin selected by the selector when A/D conversion is started and holds the sampled analog input voltage value during A/D conversion.

### (4) Voltage comparator

★ The voltage comparator compares the sampled analog input voltage to the series resistor string output voltage.

### (5) Series resistor string

The series resistor string is connected between  $AV_{\text{REF}}$  and  $AV_{\text{SS}}$ , and generates a voltage to be compared to the analog input.

**(6) ANI0 to ANI3 pins**

These are four analog input pins to input analog signals to undergo A/D conversion to the A/D converter. ANI0 to ANI3 are alternate-function pins that can also be used for digital input.

- Cautions**
- 1. Use ANI0 to ANI3 input voltages within the specification range. If a voltage higher than  $AV_{REF}$  or lower than  $AV_{SS}$  is applied (even if within the absolute maximum rating range), the conversion value of that channel will be undefined and the conversion values of other channels may also be affected.**
  - 2. Analog input (ANI0 to ANI3) pins are alternate function pins that can also be used as input port (P10 to P13) pins. When A/D conversion is performed by selecting any one of ANI0 to ANI3, do not access port 1 during conversion. It may cause the lower conversion resolution.**
  - 3. When a digital pulse is applied to a pin adjacent to the pin in the process of A/D conversion, A/D conversion values may not be obtained as expected due to coupling noise. Thus, do not apply any pulse to a pin adjacent to the pin in the process of A/D conversion.**

**(7)  $AV_{REF}$  pin**

This pin inputs the A/D converter reference voltage.

It converts signals input to ANI0 to ANI3 into digital signals according to the voltage applied between  $AV_{REF}$  and  $AV_{SS}$ .

**Caution** A series resistor string of several 10 k $\Omega$  is connected between the  $AV_{REF}$  pin and  $AV_{SS}$  pin. Therefore, when the output impedance of the reference voltage is too high, it seems as if the  $AV_{REF}$  pin and the series resistor string are connected in series. This may cause a greater reference voltage error.

**(8)  $AV_{SS}$  pin**

This is the ground potential pin of the A/D converter. Always keep it at the same potential as the  $V_{SS0}$  or  $V_{SS1}$  pin even when not using the A/D converter.

**(9)  $AV_{DD}$  pin**

This is the A/D converter analog power supply pin. Always keep it at the same potential as the  $V_{DD0}$  or  $V_{DD1}$  pin even when not using the A/D converter.

**★ (10) ADTRG pin**

This pin is a pin used to start the A/D converter by hardware.

### 11.3 Registers Controlling A/D Converter

The following two registers are used to control the A/D converter.

- A/D converter mode register 0 (ADM0)
- Analog input channel specification register 0 (ADS0)

#### (1) A/D converter mode register 0 (ADM0)

This register sets the conversion time for analog input to be A/D converted, conversion start/stop, and external trigger.

ADM0 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ADM0 to 00H.

**Figure 11-2. Format of A/D Converter Mode Register 0 (ADM0)**

Address: FF80H After reset: 00H R/W

Symbol	<7>	<6>	5	4	3	2	1	0

1	1	Both falling and rising edge detection

- ★
- Notes**
1. Set so that the A/D conversion time is 12  $\mu$ s or more.
  2. Setting prohibited because A/D conversion time is less than 12  $\mu$ s.

**Caution** When rewriting FR00 to FR02 to other than the same data, stop A/D conversion operations once prior to performing rewrite.

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. Figures in parentheses are for operation with  $f_x = 12$  MHz.

**(2) Analog input channel specification register 0 (ADS0)**

This register specifies the analog voltage input port for A/D conversion.

ADS0 is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ADS0 to 00H.

**Figure 11-3. Format of Analog Input Channel Specification Register 0 (ADS0)**

Address: FF81H After reset: 00H R/W

ADS01	ADS00	Analog input channel specification
0	0	ANI0
0	1	ANI1
1	0	ANI2
1	1	ANI3

**Note** Be sure to set bit 2 to 0.

## 11.4 Operations of A/D Converter

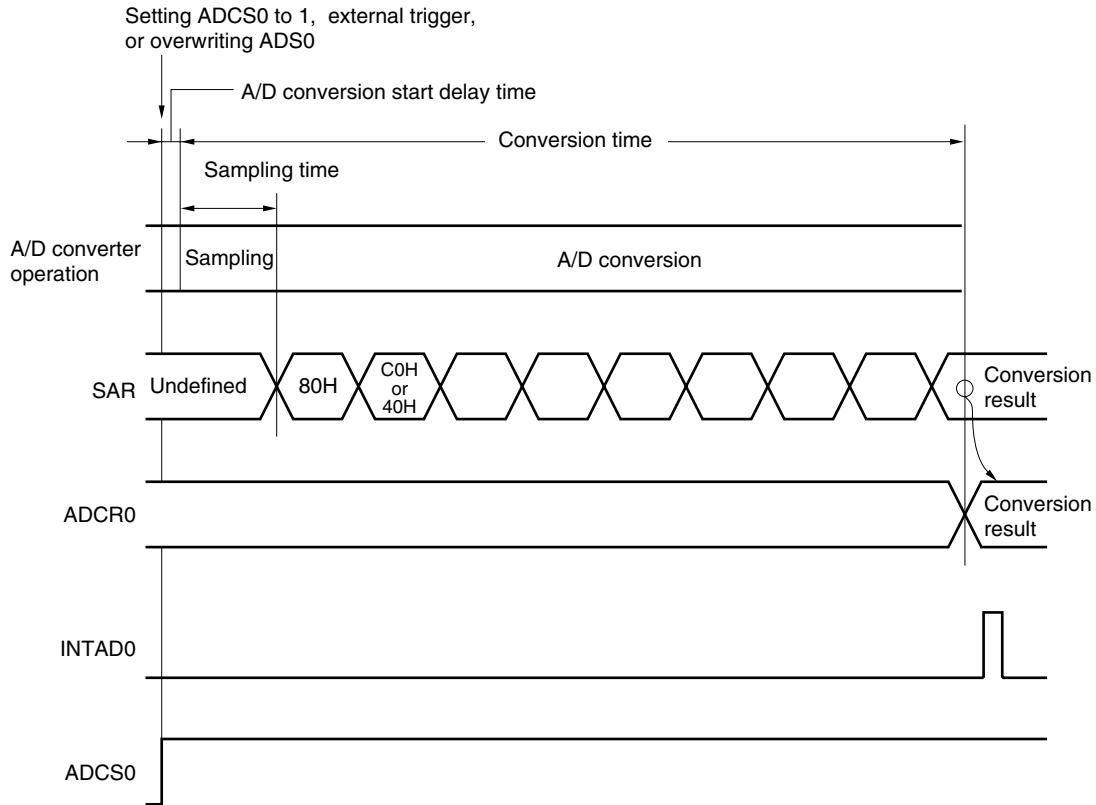

### 11.4.1 Basic operations of A/D converter

- <1> Select one channel for A/D conversion with analog input channel specification register 0 (ADS0).
- <2> The voltage input to the selected analog input channel is sampled by the sample & hold circuit.
- <3> When sampling has been done for a certain time, the sample & hold circuit is placed in the hold state and the input analog voltage is held until the A/D conversion operation is ended.
- <4> Bit 7 of the successive approximation register (SAR) is set. The series resistor string voltage tap is set to  $(1/2) AV_{REF}$  by the tap selector.
- <5> The voltage difference between the series resistor string voltage tap and analog input is compared by the voltage comparator. If the analog input is greater than  $(1/2) AV_{REF}$ , the MSB of SAR remains set. If the analog input is smaller than  $(1/2) AV_{REF}$ , the MSB is reset.
- <6> Next, bit 6 of SAR is automatically set, and the operation proceeds to the next comparison. The series resistor string voltage tap is selected according to the preset value of bit 7, as described below.
  - Bit 7 = 1:  $(3/4) AV_{REF}$
  - Bit 7 = 0:  $(1/4) AV_{REF}$
 The voltage tap and analog input voltage are compared and bit 6 of SAR is manipulated as follows.
  - Analog input voltage  $\geq$  Voltage tap: Bit 6 = 1
  - Analog input voltage  $<$  Voltage tap: Bit 6 = 0
- <7> Comparison is continued in this way up to bit 0 of SAR.
- <8> Upon completion of the comparison of 8 bits, an effective digital result value remains in SAR, and the result value is transferred to and latched in A/D conversion result register 0 (ADCR0).  
At the same time, the A/D conversion end interrupt request (INTAD0) can also be generated.

- ★ **Cautions** 1. The first A/D conversion value immediately after A/D conversion has been started may not satisfy the rated value. Take measures such as polling the A/D conversion end interrupt request (INTAD0) and removing the first conversion results.
- ★ 2. The A/D converter stops operation in standby mode.

★

Figure 11-4. Basic Operation of 8-Bit A/D Converter

A/D conversion operations are performed continuously until bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) is reset (0) by software.

$\overline{\text{RESET}}$  input clears A/D conversion result register 0 (ADCR0) to 00H.

★ Confirm the conversion results by referring to the A/D conversion end interrupt request flag (ADIF0).

The sampling time of the A/D converter varies depending on the values set in A/D converter mode register 0 (ADM0). There is a delay time from when the A/D converter is enabled for operation until sampling is actually performed. For the sets in which a strict A/D conversion time is required, note the contents described in Table 11-2.

★

**Table 11-2. Sampling Time and A/D Conversion Start Delay Time of A/D Converter**

FR02	FR01	FR00	Conversion Time <sup>Note</sup>	Sampling Time	A/D Conversion Start Delay Time	
					MIN.	MAX.
0	0	0	$144/f_x$	$20/f_x$	$0.5/f_{CPU} + 6/f_x$	$0.5/f_{CPU} + 8/f_x$
0	0	1	$120/f_x$	$16/f_x$		
0	1	0	$96/f_x$	$12/f_x$		
1	0	0	$72/f_x$	$10/f_x$	$0.5/f_{CPU} + 3/f_x$	$0.5/f_{CPU} + 4/f_x$
1	0	1	$60/f_x$	$8/f_x$		
1	1	0	$48/f_x$	$6/f_x$		
Other than above			Setting prohibited	–	–	–

**Note** Make setting so that the A/D conversion time becomes 12  $\mu$ s or longer (when operated at  $f_x = 12$  MHz).

**Remark**  $f_x$ : Main system clock oscillation frequency  
 $f_{CPU}$ : CPU clock frequency

**11.4.2 Input voltage and conversion results**

The relationship between the analog input voltage input to the analog input pins (ANI0 to ANI3) and the theoretical A/D conversion result (stored in A/D conversion result register 0 (ADCR0)) is shown by the following expression.

$$ADCR0 = \text{INT} \left( \frac{V_{AIN}}{AV_{REF}} \times 256 + 0.5 \right)$$

or

$$(ADCR0 - 0.5) \times \frac{AV_{REF}}{256} \leq V_{AIN} < (ADCR0 + 0.5) \times \frac{AV_{REF}}{256}$$

where, INT( ): Function which returns integer part of value in parentheses

$V_{AIN}$ : Analog input voltage

$AV_{REF}$ :  $AV_{REF}$  pin voltage

ADCR0: A/D conversion result register 0 (ADCR0) value

Figure 11-5 shows the relationship between the analog input voltage and the A/D conversion result.

**Figure 11-5. Relationship Between Analog Input Voltage and A/D Conversion Result**

### 11.4.3 A/D converter operation mode

Select one analog input channel from among ANI0 to ANI3 by analog input channel specification register 0 (ADS0) to start A/D conversion.

A/D conversion can be started in either of the following two ways.

- Hardware start: Conversion is started by trigger input (rising edge, falling edge, or both rising and falling edges specified).
- Software start: Conversion is started by specifying A/D converter mode register 0 (ADM0).

★ The interrupt request signal (INTAD0) is generated when the A/D conversion is complete.

#### (1) A/D conversion by hardware start

When bit 6 (TRG0) and bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) are set to 1, the A/D conversion standby state is set. When the external trigger signal (ADTRG) is input, A/D conversion of the voltage applied to the analog input pins specified by analog input channel specification register 0 (ADS0) starts.

Upon the end of the A/D conversion, the conversion result is stored in A/D conversion result register 0 (ADCRO), and the interrupt request signal (INTAD0) is generated. After the next A/D conversion operation is started and ended, the next conversion operation is not started until a new external trigger signal is input.

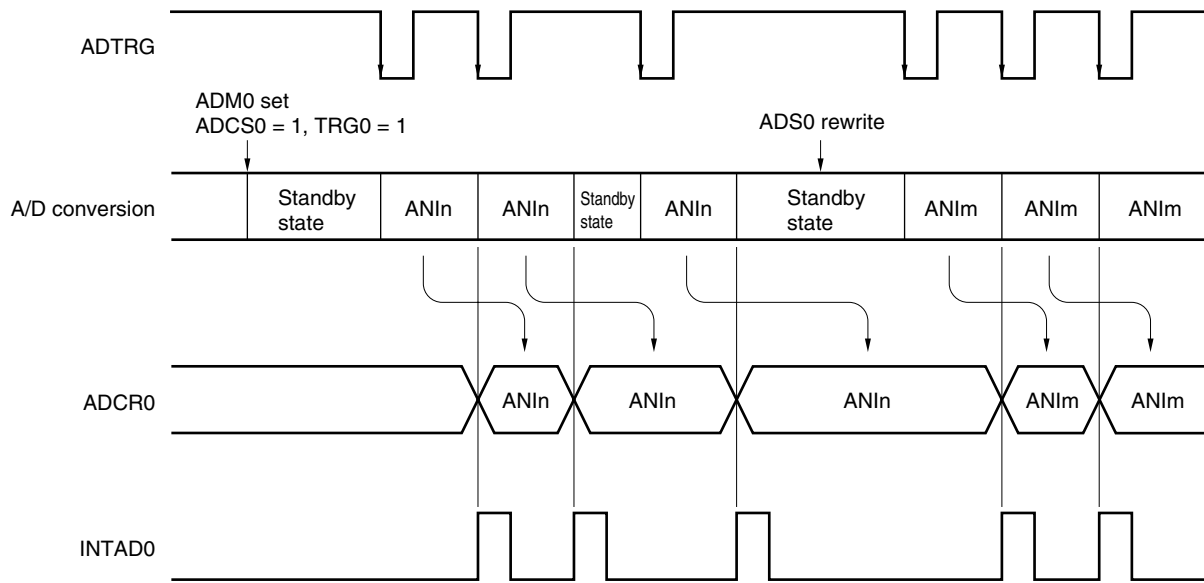

If ADS0 is rewritten during A/D conversion, the converter suspends A/D conversion and waits for a new external trigger signal to be input. When the external trigger input signal is reinput, A/D conversion is carried out from the beginning. If ADS0 is rewritten during A/D conversion waiting, A/D conversion starts when the following external trigger input signal is input.

★ If 1 is written to ADCS0 again during A/D conversion, the A/D conversion in progress is discontinued and a new A/D conversion is started when the next external trigger input signal is input.

If 0 is written to ADCS0 during A/D conversion, the A/D conversion operation stops immediately.

**Caution** When P03/INTP3/ADTRG is used as the external trigger input (ADTRG), specify the valid edge by bits 1 and 2 (EGA00, EGA01) of A/D converter mode register 0 (ADM0) and set the interrupt mask flag (PMK3) to 1.

Figure 11-6. A/D Conversion by Hardware Start (When Falling Edge Is Specified)

- Remarks**
1.  $n = 0, 1, \dots, 3$
  2.  $m = 0, 1, \dots, 3$

**(2) A/D conversion by software start**

When bit 6 (TRG0) and bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) are set to 0 and 1, respectively, A/D conversion of the voltage applied to the analog input pin specified by analog input channel specification register 0 (ADS0) starts.

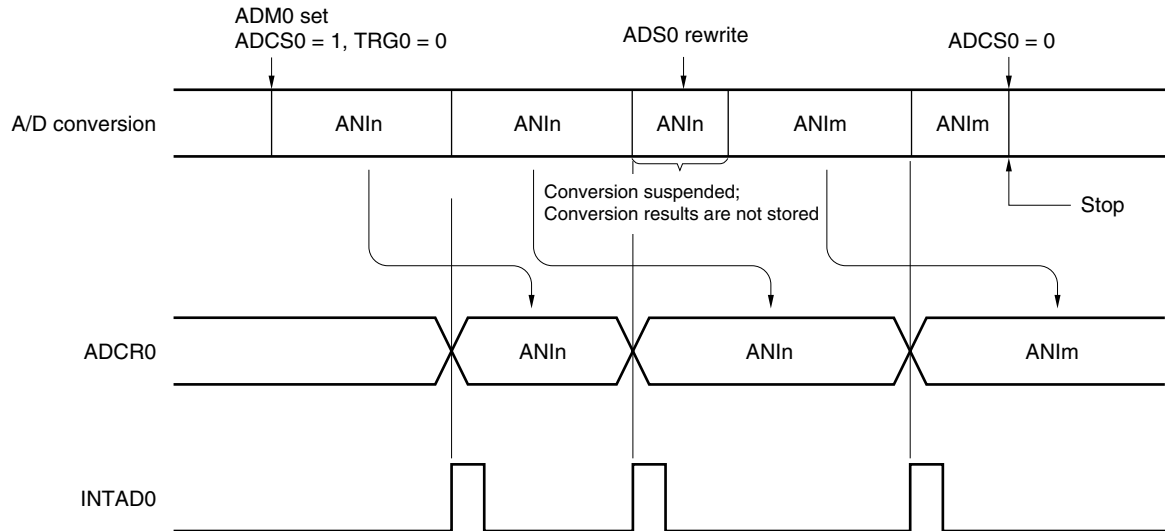

Upon the end of the A/D conversion, the conversion result is stored in A/D conversion result register 0 (ADCR0), and the interrupt request signal (INTAD0) is generated. After one A/D conversion operation is started and ended, the next conversion operation is immediately started. A/D conversion operations are repeated until new data is written to ADS0.

If ADS0 is rewritten during A/D conversion, the converter suspends A/D conversion and A/D conversion of the newly selected analog input channel is started.

★ If 1 is written to ADCS0 again during A/D conversion, the A/D conversion in progress is discontinued and a new A/D conversion is started.

If 0 is written to ADCS0 during A/D conversion, the A/D conversion operation stops immediately.

**Figure 11-7. A/D Conversion by Software Start**

- Remarks**
1.  $n = 0, 1, \dots, 3$
  2.  $m = 0, 1, \dots, 3$

## 11.5 How to Read A/D Converter Characteristics Table

Here we will explain the special terms unique to A/D converters.

### (1) Resolution

This is the minimum analog input voltage that can be identified. That is, the percentage of the analog input voltage per 1 bit of digital output is called 1LSB (Least Significant Bit). The percentage of 1LSB with respect to the full scale is expressed by %FSR (Full Scale Range).

When the resolution is 8 bits,

$$\begin{aligned} 1\text{LSB} &= 1/2^8 = 1/256 \\ &= 0.4\% \text{FSR} \end{aligned}$$

Accuracy has no relation to resolution, but is determined by overall error.

### (2) Overall error

This shows the maximum error value between the actual measured value and the theoretical value. Zero scale error, full scale error, integral linearity error, differential linearity error and errors which are combinations of these express overall error.

Furthermore, quantization error is not included in overall error in the characteristics table.

### (3) Quantization error

When analog values are converted to digital values, there naturally occurs a  $\pm 1/2\text{LSB}$  error. In an A/D converter, an analog input voltage in a range of  $\pm 1/2\text{LSB}$  are converted to the same digital code, so a quantization error cannot be avoided.

Furthermore, it is not included in the overall error, zero scale error, full scale error, integral linearity error, and differential linearity error in the characteristics table.

Figure 11-8. Overall Error

Figure 11-9. Quantization Error

**(4) Zero scale error**

This shows the difference between the actual measured value of the analog input voltage and the theoretical value ( $1/2\text{LSB}$ ) when the digital output changes from 0.....000 to 0.....001. If the actual measured value is greater than the theoretical value, it shows the difference between the actual measured value of the analog input voltage and the theoretical value ( $3/2\text{LSB}$ ) when the digital output changes from 0.....001 to 0.....010.

**(5) Full scale error**

This shows the difference between the actual measured value of the analog input voltage and the theoretical value (full scale  $-3/2\text{LSB}$ ) when the digital output changes from 1.....110 to 1.....111.

**(6) Integral linearity error**

This shows the degree to which the conversion characteristics deviate from the ideal linear relationship. It expresses the maximum value of the difference between the actual measured value and the ideal straight line when the zero scale error and full scale error are 0.

**(7) Differential linearity error**

Although the ideal output width for a given code is 1LSB, this value shows the difference between the actual measured value and the ideal value of the width when outputting a particular code.

**Figure 11-10. Zero Scale Error**

**Figure 11-11. Full Scale Error**

**Figure 11-12. Integral Linearity Error**

**Figure 11-13. Differential Linearity Error**

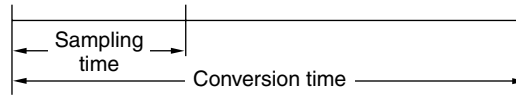

**★ (8) Conversion time**

This expresses the time from when the sampling was started to the time when the digital output was obtained. Sampling time is included in the conversion time in the characteristics table.

**(9) Sampling time**

This is the time the analog switch is turned on for the analog voltage to be sampled by the sample & hold circuit.

## 11.6 Cautions for A/D Converter

### (1) Power consumption in standby mode

A/D converter stops operating in the standby mode. At this time, power consumption can be reduced by clearing bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) to 0.

Figure 11-14 shows the circuit configuration of a series resistor string.

Figure 11-14. Circuit Configuration of Series Resistor String

### (2) Input range of ANI0 to ANI3

The input voltages of ANI0 to ANI3 should be within the specification range. In particular, if a voltage higher than AVREF or lower than AVSS is input (even if within the absolute maximum rating range), the conversion value of that channel will be undefined and the conversion values of other channels may also be affected.

### (3) Contending operations

- <1> Contention between A/D conversion result register 0 (ADCR0) write and ADCR0 read by instruction upon the end of conversion  
ADCR0 read is given priority. After the read operation, the new conversion result is written to ADCR0.
- <2> Contention between ADCR0 write and external trigger signal input upon the end of conversion  
The external trigger signal is not accepted during A/D conversion. Therefore, the external trigger signal is not accepted during ADCR0 write.
- <3> Contention between ADCR0 write and A/D converter mode register 0 (ADM0) write or analog input channel specification register 0 (ADS0) write upon the end of conversion  
ADM0 or ADS0 write is given priority. ADCR0 write is not performed, nor is the conversion end interrupt request signal (INTAD0) generated.

### (4) ANI0/P10 to ANI3/P13

- <1> The analog input pins (ANI0 to ANI3) also function as input port pins (P10 to P13).  
When A/D conversion is performed with any of pins ANI0 to ANI3 selected, do not access port 1 while conversion is in progress, as this may reduce the conversion resolution.
- <2> If digital pulses are applied to a pin adjacent to the pin in the process of A/D conversion, the expected A/D conversion value may not be obtainable due to coupling noise. Therefore, avoid applying pulses to pins adjacent to the pin undergoing A/D conversion.

**(5) AVREF pin input impedance**

A series resistor string of several 10 k $\Omega$  is connected between the AVREF pin and the AVSS pin. Therefore, when the output impedance of the reference voltage is too high, it seems as if the AVREF pin and the series resistor string are connected in series. This may cause a greater reference voltage error.

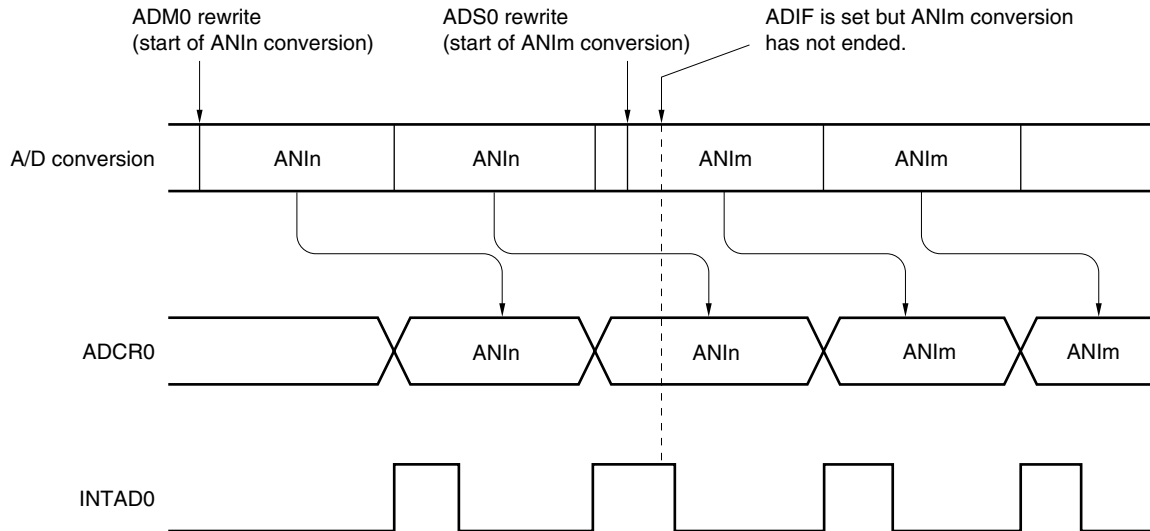

**(6) Interrupt request flag (ADIF0)**

The interrupt request flag (ADIF0) is not cleared even if analog input channel specification register 0 (ADS0) is changed.

Therefore, if an analog input pin is changed during A/D conversion, the A/D conversion result and conversion end interrupt request flag for the pre-change analog input may be set just before the ADS0 rewrite. Caution is therefore required since, at this time, when ADIF0 is read immediately just after the ADS0 rewrite, ADIF0 is set despite the fact that the A/D conversion for the post-change analog input has not ended.

When the A/D conversion is restarted after it is stopped, clear ADIF0 before restart.

**Figure 11-15. A/D Conversion End Interrupt Request Generation Timing**

- Remarks**
1.  $n = 0, 1, \dots, 3$
  2.  $m = 0, 1, \dots, 3$

**(7) Conversion results just after A/D conversion start**

The A/D conversion value just after A/D conversion operations start may not fall within the rating. Polling A/D conversion end interrupt request (INTAD0) and take measures such as removing the first conversion results.

**(8) A/D conversion result register 0 (ADCR0) read operation**

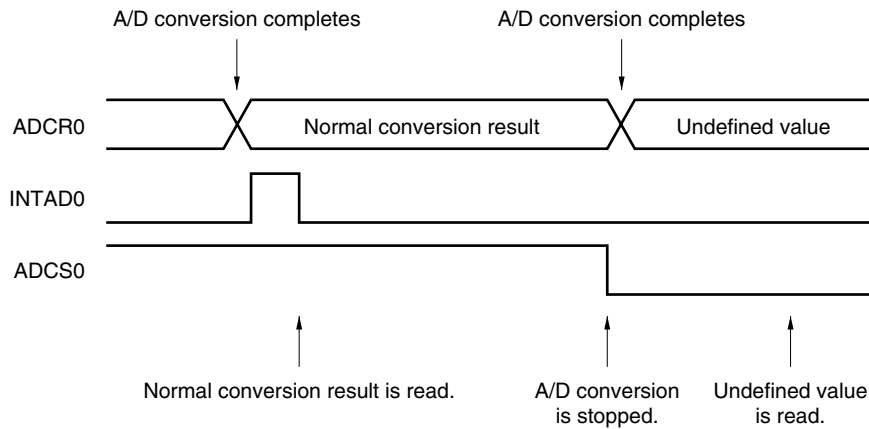

When writing is performed to A/D converter mode register 0 (ADM0) and analog input channel specification register 0 (ADS0), the contents of ADCR0 may become undefined. Read the conversion result following conversion completion before writing to ADM0, ADS0. Using a timing other than the above may cause an incorrect conversion result to be read.

**(9) Timing at which A/D conversion result is undefined**

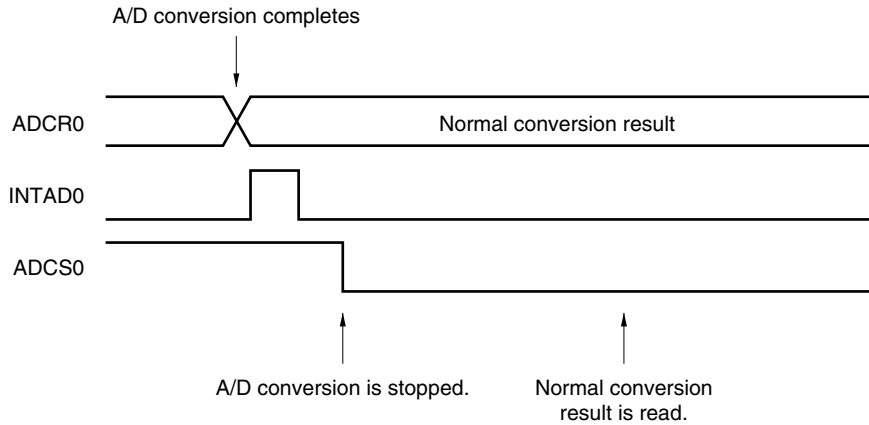

The A/D conversion value may be undefined if the timing of completion of A/D conversion and the timing of stopping the A/D conversion conflict with each other. Therefore, read the A/D conversion result during the A/D conversion operation. To read the conversion result after stopping the A/D conversion operation, be sure to stop the A/D conversion before the next conversion ends.

Figures 11-16 and 11-17 show the timing of reading the conversion result.

**Figure 11-16. Timing of Reading Conversion Result (When Conversion Result Is Undefined)**

**Figure 11-17. Timing of Reading Conversion Result (When Conversion Result Is Normal)**

**(10) Notes on board design**

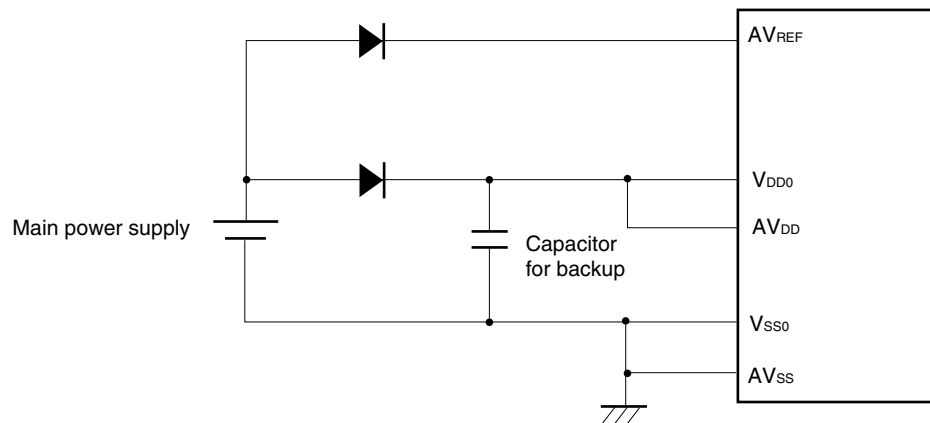

Locate analog circuits as far away from digital circuits as possible on the board because the analog circuits may be affected by the noise of the digital circuits. In particular, do not cross an analog signal line with a digital signal line, or wire an analog signal line in the vicinity of a digital signal line. Otherwise, the A/D conversion characteristics may be affected by the noise of the digital line.

Connect AV<sub>SS0</sub> and V<sub>SS0</sub> at one location on the board where the voltages are stable.

**(11) AV<sub>DD</sub> pin**

The AV<sub>DD</sub> pin is the analog circuit power supply pin. It supplies power to the input circuits of the ANI0 to ANI3 pins.

Therefore, be sure to apply the same potential as V<sub>DD0</sub> to this pin even for applications designed to switch to a backup battery for power supply.

**Figure 11-18. AV<sub>DD</sub> Pin Connection****(12) AV<sub>REF</sub> pin**

Connect a capacitor to the AV<sub>REF</sub> pin to minimize conversion errors due to noise. If an A/D conversion operation has been stopped and then is started, the voltage applied to the AV<sub>REF</sub> pin becomes unstable, causing the accuracy of the A/D conversion to drop. To prevent this, also connect a capacitor to the AV<sub>REF</sub> pin.

Figure 11-19 shows an example of connecting a capacitor.

★

**Figure 11-19. Example of Connecting Capacitor to AV<sub>REF</sub> Pin**

**Remark** C1: 4.7  $\mu$ F to 10  $\mu$ F (reference value)

C2: 0.01  $\mu$ F to 0.1  $\mu$ F (reference value)

Connect C2 as close to the pin as possible.

**(13) Internal equivalent circuit of ANI0 to ANI3 pins and permissible signal source impedance**

To complete sampling within the sampling time with sufficient A/D conversion accuracy, the impedance of the signal source such as a sensor must be sufficiently low. Figure 11-20 shows the internal equivalent circuit of the ANI0 to ANI3 pins.

If the impedance of the signal source is high, connect capacitors with a high capacitance to the pins ANI0 to ANI3. An example of this is shown in Figure 11-21. In this case, however, the microcontroller cannot follow an analog signal with a high differential coefficient because a lowpass filter is created.

To convert a high-speed analog signal or to convert an analog signal in the scan mode, insert a low-impedance buffer.

**Figure 11-20. Internal Equivalent Circuit of Pins ANI0 to ANI3**

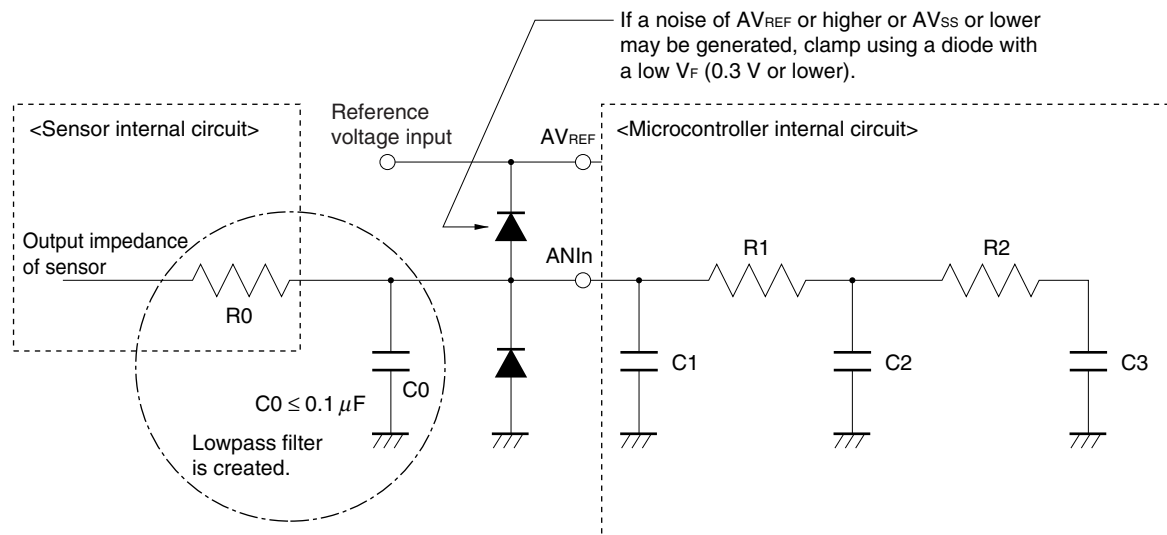

**Remark** n = 0 to 3

★

**Table 11-3. Resistance and Capacitance of Equivalent Circuit (Reference Values)**

$AV_{REF}$	R1	R2	C1	C2	C3
2.7 V	12 k $\Omega$	8 k $\Omega$	3 pF	3 pF	2 pF
4.5 V	4 k $\Omega$	2.7 k $\Omega$	3 pF	1.4 pF	2 pF

**Caution** The resistance and capacitance in Table 11-3 are not guaranteed values.

★ **Figure 11-21. Example of Connection When Signal Source Impedance Is High**

**Remark**  $n = 0$  to 3

★ **(14) Input impedance of ANI0 to ANI3 pins**

This A/D converter executes sampling by charging the internal sampling capacitor for approximately 1/10 of the conversion time.

Therefore, only the leakage current flows during other than sampling, and the current for charging the capacitor flows during sampling. The input impedance therefore varies and has no meaning.

To achieve sufficient sampling, it is recommended that the output impedance of the analog input source be  $10 \text{ k}\Omega$  or less, or attach a capacitor of around  $100 \text{ pF}$  to the ANI0 to ANI3 pins (see **Figure 11-21**).

## CHAPTER 12 10-BIT A/D CONVERTER ( $\mu$ PD780034AS SUBSERIES)

### 12.1 Functions of A/D Converter

A/D converter is a 10-bit resolution converter that converts analog inputs into digital signals. It can control up to 4 analog input channels (ANI0 to ANI3).

#### (1) Hardware start

Conversion is started by trigger input (ADTRG: rising edge, falling edge, or both rising and falling edges can be specified).

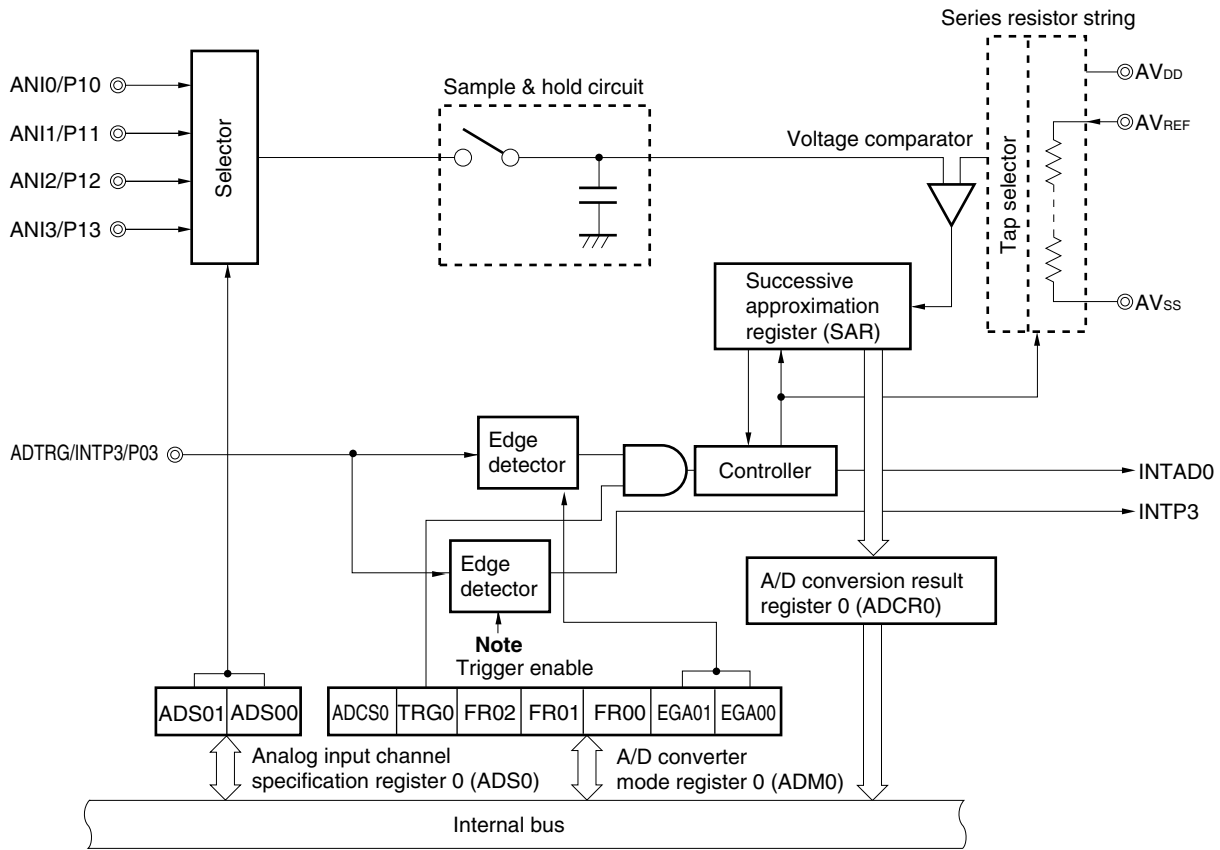

#### (2) Software start

Conversion is started by setting A/D converter mode register 0 (ADM0).

Select one channel for analog input from ANI0 to ANI3 to start A/D conversion. In the case of hardware start, the A/D converter stops when A/D conversion is completed, and an interrupt request (INTAD0) is generated. In the case of software start, A/D conversion is repeated. Each time as A/D conversion operation ends, an interrupt request (INTAD0) is generated.

**Caution** Although the  $\mu$ PD78F0034BS incorporate a 10-bit A/D converter, this converter can be operated as an 8-bit A/D converter by using the device file DF780024.

Figure 12-1. Block Diagram of 10-Bit A/D Converter

**Note** The valid edge of an external interrupt is specified by bit 3 of the EGP and EGN registers (see **Figure 15-5 Format of External Interrupt Rising Edge Enable Register (EGP) and External Interrupt Falling Edge Enable Register (EGN)**).

## 12.2 Configuration of A/D Converter

The A/D converter includes the following hardware.

**Table 12-1. Configuration of A/D Converter**

Item	Configuration
Analog input	4 channels (ANI0 to ANI3)
Hardware trigger input	1 (ADTRG)
Registers	Successive approximation register (SAR) A/D conversion result register 0 (ADCR0)
Control registers	A/D converter mode register 0 (ADM0) Analog input channel specification register 0 (ADS0)

### (1) Successive approximation register (SAR)

This register compares the analog input voltage value to the voltage tap (compare voltage) value applied from the series resistor string, and holds the result from the most significant bit (MSB).

When up to the least significant bit (LSB) is hold (end of A/D conversion), the SAR contents are transferred to A/D conversion result register 0 (ADCR0).

### (2) A/D conversion result register 0 (ADCR0)

This is a 16-bit register that stores the A/D conversion results. The lower 6 bits are fixed to 0. Each time A/D conversion ends, the conversion result is loaded from the successive approximation register (SAR) and held by this register. The most significant bit (MSB) is stored in ADCR0 first. The higher 8 bits of the conversion results are stored in FF17H. The lower 2 bits of the conversion results are stored in FF16H.

ADCR0 is read by a 16-bit memory manipulation instruction.

RESET input sets ADCR0 to 0000H.

**Figure 12-2. Format of A/D Conversion Result Register 0 (ADCR0)**

Address: FF16H, FF17H After reset: 0000H R

**Caution** When A/D converter mode register 0 (ADM0) and analog input channel specification register 0 (ADS0) are written, the contents of ADCR0 may become undefined. Read the conversion result following conversion completion before writing to ADM0 and ADS0. Using a timing other than the above may cause an incorrect conversion result to be read.

### (3) Sample & hold circuit

The sample & hold circuit samples the input signal of the analog input pin selected by the selector when A/D conversion is started and holds the sampled analog input voltage value during A/D conversion.

### (4) Voltage comparator

The voltage comparator compares the sampled analog input voltage to the series resistor string output voltage.

**(5) Series resistor string**

The series resistor string is connected between  $AV_{REF}$  and  $AV_{SS}$ , and generates a voltage to be compared to the analog input.

**(6) ANI0 to ANI3 pins**

These are four analog input pins to input analog signals to undergo A/D conversion to the A/D converter. ANI0 to ANI3 are alternate-function pins that can also be used for digital input.

- Cautions**
- 1. Use ANI0 to ANI3 input voltages within the specification range. If a voltage higher than  $AV_{REF}$  or lower than  $AV_{SS}$  is applied (even if within the absolute maximum rating range), the conversion value of that channel will be undefined and the conversion values of other channels may also be affected.**
  - 2. Analog input (ANI0 to ANI3) pins are alternate function pins that can also be used as input port (P10 to P13) pins. When A/D conversion is performed by selecting any one of ANI0 to ANI3, do not access port 1 during conversion. It may cause the lower conversion resolution.**
  - 3. When a digital pulse is applied to a pin adjacent to the pin in the process of A/D conversion, A/D conversion values may not be obtained as expected due to coupling noise. Thus, do not apply any pulse to a pin adjacent to the pin in the process of A/D conversion.**

**(7)  $AV_{REF}$  pin**

This pin inputs the A/D converter reference voltage.

It converts signals input to ANI0 to ANI3 into digital signals according to the voltage applied between  $AV_{REF}$  and  $AV_{SS}$ .

**Caution** A series resistor string of several 10 k $\Omega$  is connected between the  $AV_{REF}$  and  $AV_{SS}$  pins. Therefore, when output impedance of the reference voltage is too high, it seems as if the  $AV_{REF}$  pin and the series resistor string are connected in series. This may cause a greater reference voltage error.

**(8)  $AV_{SS}$  pin**

This is the ground potential pin of the A/D converter. Always keep it at the same potential as the  $V_{SS0}$  or  $V_{SS1}$  pin when not using the A/D converter.

**(9)  $AV_{DD}$  pin**

This is the A/D converter analog power supply pin. Always keep it at the same potential as the  $V_{DD0}$  or  $V_{DD1}$  pin even when not using the A/D converter.

**★ (10) ADTRG pin**

This pin is a pin used to start the A/D converter by hardware.

### 12.3 Registers Controlling A/D Converter

The following two registers are used to control the A/D converter.

- A/D converter mode register 0 (ADM0)
- Analog input channel specification register 0 (ADS0)

#### (1) A/D converter mode register 0 (ADM0)

This register sets the conversion time for analog input to be A/D converted, conversion start/stop, and external trigger.

ADM0 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ADM0 to 00H.

**Figure 12-3. Format of A/D Converter Mode Register 0 (ADM0)**

Address: FF80H After reset: 00H R/W

Symbol	<7>	<6>	5	4	3	2	1	0
ADM0	ADCS0	TRG0	FR02	FR01	FR00	EGA01	EGA00	0

ADCS0	A/D conversion operation control
0	Stop conversion operation.
1	Enable conversion operation.

TRG0	Software start/hardware start selection
0	Software start
1	Hardware start

FR02	FR01	FR00	Conversion time selection <sup>Note 1</sup>
0	0	0	144/fx (12.0 $\mu$ s)
0	0	1	120/fx (Setting prohibited <sup>Note 1</sup> )
0	1	0	96/fx (Setting prohibited <sup>Note 2</sup> )
1	0	0	72/fx (Setting prohibited <sup>Note 2</sup> )
1	0	1	60/fx (Setting prohibited <sup>Note 2</sup> )
1	1	0	48/fx (Setting prohibited <sup>Note 2</sup> )
Other than above			Setting prohibited

EGA01	EGA00	External trigger signal, edge specification
0	0	No edge detection
0	1	Falling edge detection
1	0	Rising edge detection
1	1	Both falling and rising edge detection

- Notes**
1. Set so that the A/D conversion time is 12  $\mu$ s or more.
  2. Setting prohibited because A/D conversion time is less than 12  $\mu$ s.

**Caution** When rewriting FR00 to FR02 to other than the same data, stop A/D conversion operations once prior to performing rewrite.

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. Figures in parentheses are for operation with  $f_x = 12$  MHz.

**(2) Analog input channel specification register 0 (ADS0)**

This register specifies the analog voltage input port for A/D conversion.

ADS0 is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ADS0 to 00H.

**Figure 12-4. Format of Analog Input Channel Specification Register 0 (ADS0)**

## 12.4 Operations of A/D Converter

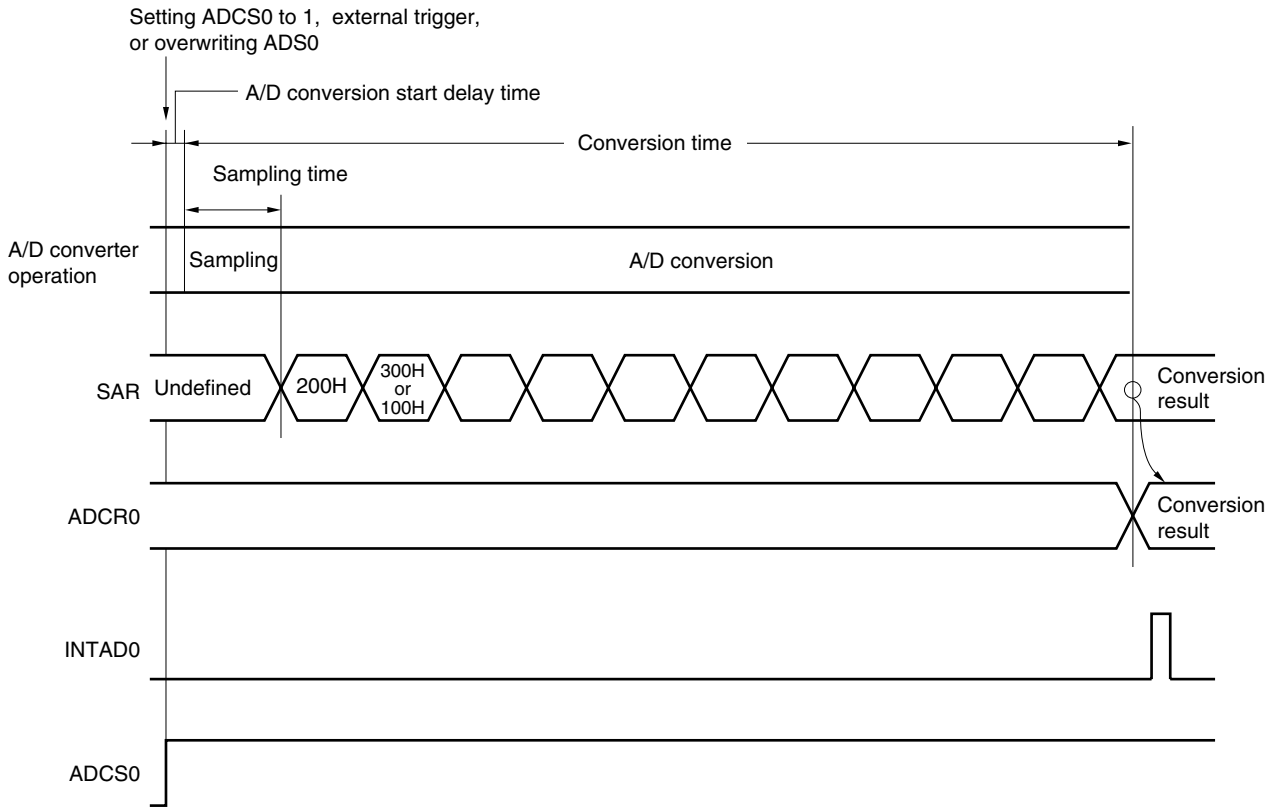

### 12.4.1 Basic operations of A/D converter

- <1> Select one channel for A/D conversion with analog input channel specification register 0 (ADS0).
- <2> The voltage input to the selected analog input channel is sampled by the sample & hold circuit.
- <3> When sampling has been done for a certain time, the sample & hold circuit is placed in the hold state and the input analog voltage is held until the A/D conversion operation is ended.
- <4> Bit 9 of the successive approximation register (SAR) is set. The series resistor string voltage tap is set to  $(1/2) AV_{REF}$  by the tap selector.
- <5> The voltage difference between the series resistor string voltage tap and analog input is compared by the voltage comparator. If the analog input is greater than  $(1/2) AV_{REF}$ , the MSB of SAR remains set. If the analog input is smaller than  $(1/2) AV_{REF}$ , the MSB is reset.
- <6> Next, bit 8 of SAR is automatically set, and the operation proceeds to the next comparison. The series resistor string voltage tap is selected according to the preset value of bit 9, as described below.
  - Bit 9 = 1:  $(3/4) AV_{REF}$
  - Bit 9 = 0:  $(1/4) AV_{REF}$
 The voltage tap and analog input voltage are compared and bit 8 of SAR is manipulated as follows.
  - Analog input voltage  $\geq$  Voltage tap: Bit 8 = 1
  - Analog input voltage  $<$  Voltage tap: Bit 8 = 0
- <7> Comparison is continued in this way up to bit 0 of SAR.
- <8> Upon completion of the comparison of 10 bits, an effective digital result value remains in SAR, and the result value is transferred to and latched in A/D conversion result register 0 (ADCR0).  
At the same time, the A/D conversion end interrupt request (INTAD0) can also be generated.

- ★ **Cautions** 1. The first A/D conversion value immediately after A/D conversion has been started may not satisfy the rated value. Take measures such as polling the A/D conversion end interrupt request (INTAD0) and removing the first conversion results.
- ★ 2. The A/D converter stops operation in standby mode.

★

Figure 12-5. Basic Operation of 10-Bit A/D Converter

A/D conversion operations are performed continuously until bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) is reset (0) by software.

$\overline{\text{RESET}}$  input clears A/D conversion result register 0 (ADCR0) to 0000H.

★ Confirm the conversion results by referring to the A/D conversion end interrupt request flag (ADIF0).

The sampling time of the A/D converter varies depending on the values set in A/D converter mode register 0 (ADM0). There is a delay time from when the A/D converter is enabled for operation until sampling is actually performed. For the sets in which a strict A/D conversion time is required, note the contents described in Table 12-2.

★ **Table 12-2. Sampling Time and A/D Conversion Start Delay Time of A/D Converter**

FR02	FR01	FR00	Conversion Time <sup>Note</sup>	Sampling Time	A/D Conversion Start Delay Time	
					MIN.	MAX.
0	0	0	$144/f_x$	$20/f_x$	$0.5/f_{CPU} + 6/f_x$	$0.5/f_{CPU} + 8/f_x$
0	0	1	$120/f_x$	$16/f_x$		
0	1	0	$96/f_x$	$12/f_x$		
1	0	0	$72/f_x$	$10/f_x$	$0.5/f_{CPU} + 3/f_x$	$0.5/f_{CPU} + 4/f_x$
1	0	1	$60/f_x$	$8/f_x$		
1	1	0	$48/f_x$	$6/f_x$		
Other than above			Setting prohibited	–	–	–

**Note** Make setting so that the A/D conversion time becomes 12  $\mu$ s or longer (when operated at  $f_x = 12$  MHz).

**Remark**  $f_x$ : Main system clock oscillation frequency  
 $f_{CPU}$ : CPU clock frequency

**12.4.2 Input voltage and conversion results**

The relationship between the analog input voltage input to the analog input pins (ANI0 to ANI7) and the theoretical A/D conversion result (stored in A/D conversion result register 0 (ADCR0)) is shown by the following expression.

$$ADCR0 = \text{INT} \left( \frac{V_{AIN}}{AV_{REF}} \times 1024 + 0.5 \right)$$

or

$$(ADCR0 - 0.5) \times \frac{AV_{REF}}{1024} \leq V_{AIN} < (ADCR0 + 0.5) \times \frac{AV_{REF}}{1024}$$

where, INT( ): Function which returns integer part of value in parentheses

$V_{AIN}$ : Analog input voltage

$AV_{REF}$ :  $AV_{REF}$  pin voltage

ADCR0: A/D conversion result register 0 (ADCR0) value

Figure 12-6 shows the relationship between the analog input voltage and the A/D conversion result.

**Figure 12-6. Relationship Between Analog Input Voltage and A/D Conversion Result**

### 12.4.3 A/D converter operation mode

Select one analog input channel from among ANI0 to ANI3 by analog input channel specification register 0 (ADS0) to start A/D conversion.

A/D conversion can be started in either of the following two ways.

- Hardware start: Conversion is started by trigger input (rising edge, falling edge, or both rising and falling edges specified).
- Software start: Conversion is started by specifying A/D converter mode register 0 (ADM0).

★ The interrupt request signal (INTAD0) is generated when the A/D conversion is complete.

#### (1) A/D conversion by hardware start

When bit 6 (TRG0) and bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) are set to 1, the A/D conversion standby state is set. When the external trigger signal (ADTRG) is input, A/D conversion of the voltage applied to the analog input pin specified by analog input channel specification register 0 (ADS0) starts.

Upon the end of the A/D conversion, the conversion result is stored in A/D conversion result register 0 (ADCR0), and the interrupt request signal (INTAD0) is generated. After the next A/D conversion operation is started and ended, the next conversion operation is not started until a new external trigger signal is input.

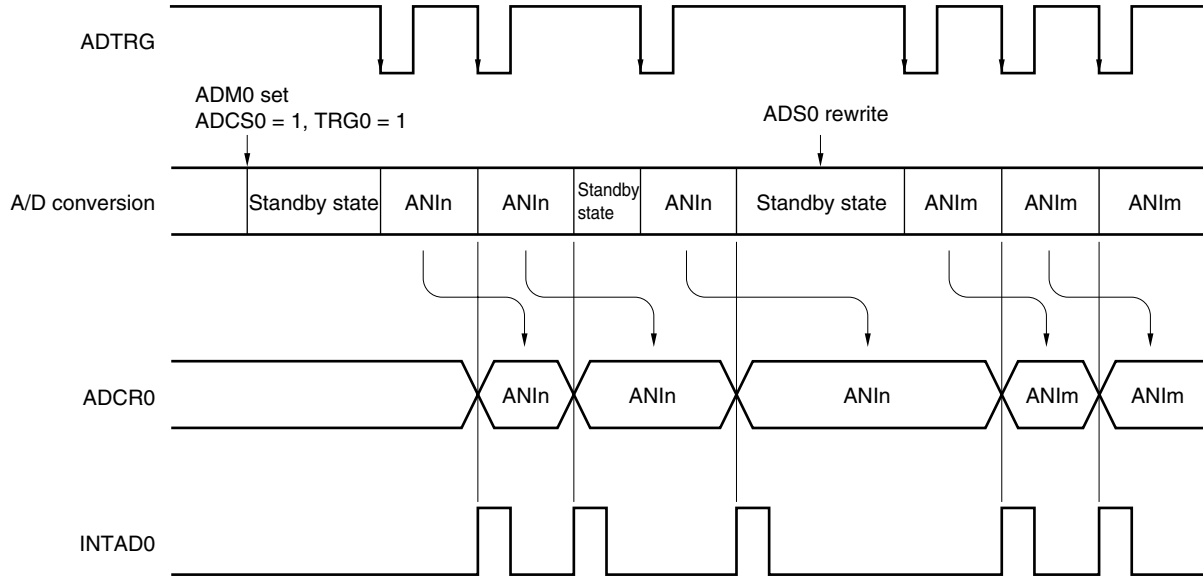

If ADS0 is rewritten during A/D conversion, the converter suspends A/D conversion and waits for a new external trigger signal to be input. When the external trigger input signal is reinput, A/D conversion is carried out from the beginning. If ADS0 is rewritten during A/D conversion waiting, A/D conversion starts when the following external trigger input signal is input.

★ If 1 is written to ADCS0 again during A/D conversion, the A/D conversion in progress is discontinued and a new A/D conversion is started when the next external trigger input signal is input.

If 0 is written to ADCS0 during A/D conversion, the A/D conversion operation stops immediately.

**Caution** When P03/INTP3/ADTRG is used as the external trigger input (ADTRG), specify the valid edge by bits 1 and 2 (EGA00, EGA01) of A/D converter mode register 0 (ADM0) and set the interrupt mask flag (PMK3) to 1.

Figure 12-7. A/D Conversion by Hardware Start (When Falling Edge Is Specified)

- Remarks**
1.  $n = 0, 1, \dots, 3$
  2.  $m = 0, 1, \dots, 3$

**(2) A/D conversion by software start**

When bit 6 (TRG0) and bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) are set to 0 and 1, respectively, A/D conversion of the voltage applied to the analog input pin specified by analog input channel specification register 0 (ADS0) starts.

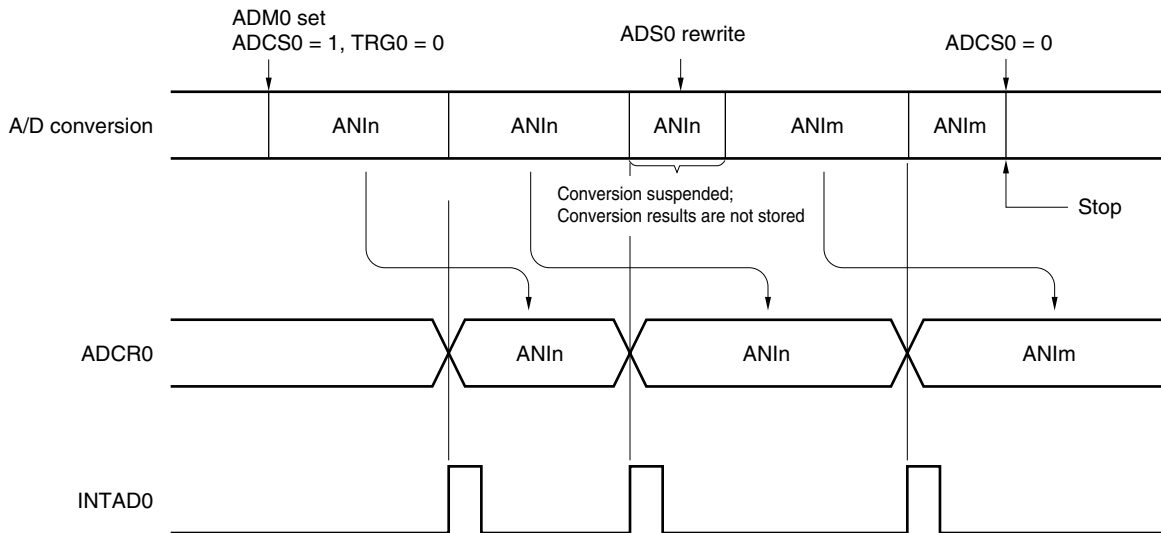

Upon the end of the A/D conversion, the conversion result is stored in A/D conversion result register 0 (ADCR0), and the interrupt request signal (INTAD0) is generated. After one A/D conversion operation is started and ended, the next conversion operation is immediately started. A/D conversion operations are repeated until new data is written to ADS0.

If ADS0 is rewritten during A/D conversion, the converter suspends A/D conversion and A/D conversion of the new selected analog input channel is started.

★ If 1 is written to ADCS0 again during A/D conversion, the A/D conversion in progress is discontinued and a new A/D conversion is started.

If 0 is written to ADCS0 during A/D conversion, the A/D conversion operation stops immediately.

**Figure 12-8. A/D Conversion by Software Start**

- Remarks**
1.  $n = 0, 1, \dots, 3$
  2.  $m = 0, 1, \dots, 3$

## 12.5 How to Read A/D Converter Characteristics Table

Here we will explain the special terms unique to A/D converters.

### (1) Resolution

This is the minimum analog input voltage that can be identified. That is, the percentage of the analog input voltage per 1 bit of digital output is called 1LSB (Least Significant Bit). The percentage of 1LSB with respect to the full scale is expressed by %FSR (Full Scale Range).

When the resolution is 10 bits,

$$\begin{aligned} 1\text{LSB} &= 1/2^{10} = 1/1024 \\ &= 0.098\% \text{FSR} \end{aligned}$$

Accuracy has no relation to resolution, but is determined by overall error.

### (2) Overall error

This shows the maximum error value between the actual measured value and the theoretical value. Zero scale error, full scale error, integral linearity error, differential linearity error and errors which are combinations of these express overall error.

Furthermore, quantization error is not included in overall error in the characteristics table.

### (3) Quantization error

When analog values are converted to digital values, there naturally occurs a  $\pm 1/2\text{LSB}$  error. In an A/D converter, an analog input voltage in a range of  $\pm 1/2\text{LSB}$  are converted to the same digital code, so a quantization error cannot be avoided.

Furthermore, it is not included in the overall error, zero scale error, full scale error, integral linearity error, and differential linearity error in the characteristics table.

Figure 12-9. Overall Error

Figure 12-10. Quantization Error

**(4) Zero scale error**

This shows the difference between the actual measured value of the analog input voltage and the theoretical value ( $1/2\text{LSB}$ ) when the digital output changes from 0.....000 to 0.....001. If the actual measured value is greater than the theoretical value, it shows the difference between the actual measured value of the analog input voltage and the theoretical value ( $3/2\text{LSB}$ ) when the digital output changes from 0.....001 to 0.....010.

**(5) Full scale error**

This shows the difference between the actual measured value of the analog input voltage and the theoretical value (full scale  $-3/2\text{LSB}$ ) when the digital output changes from 1.....110 to 1.....111.

**(6) Integral linearity error**

This shows the degree to which the conversion characteristics deviate from the ideal linear relationship. It expresses the maximum value of the difference between the actual measured value and the ideal straight line when the zero scale error and full scale error are 0.

**(7) Differential linearity error**

Although the ideal output width for a given code is 1LSB, this value shows the difference between the actual measured value and the ideal value of the width when outputting a particular code.

**Figure 12-11. Zero Scale Error**

**Figure 12-12. Full Scale Error**

**Figure 12-13. Integral Linearity Error**

**Figure 12-14. Differential Linearity Error**

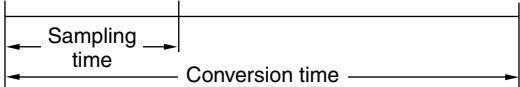

★ (8) Conversion time

This expresses the time from when the sampling was started to the time when the digital output was obtained. Sampling time is included in the conversion time in the characteristics table.

(9) Sampling time

This is the time the analog switch is turned on for the analog voltage to be sampled by the sample & hold circuit.

## 12.6 Cautions for A/D Converter

### (1) Power consumption in standby mode

A/D converter stops operating in the standby mode. At this time, power consumption can be reduced by clearing bit 7 (ADCS0) of A/D converter mode register 0 (ADM0) to 0.

Figure 12-15 shows the circuit configuration of a series resistor string.

**Figure 12-15. Circuit Configuration of Series Resistor String**

### (2) Input range of ANI0 to ANI3

The input voltages of ANI0 to ANI3 should be within the specification range. In particular, if a voltage higher than AVREF or lower than AVSS is input (even if within the absolute maximum rating range), the conversion value of that channel will be undefined and the conversion values of other channels may also be affected.

### (3) Contending operations

- <1> Contention between A/D conversion result register 0 (ADCR0) write and ADCR0 read by instruction upon the end of conversion  
ADCR0 read is given priority. After the read operation, the new conversion result is written to ADCR0.
- <2> Contention between ADCR0 write and external trigger signal input upon the end of conversion  
The external trigger signal is not accepted during A/D conversion. Therefore, the external trigger signal is not accepted during ADCR0 write.
- <3> Contention between ADCR0 write and A/D converter mode register 0 (ADM0) write or analog input channel specification register 0 (ADS0) write upon the end of conversion  
ADM0 or ADS0 write is given priority. ADCR0 write is not performed, nor is the conversion end interrupt request signal (INTAD0) generated.

### (4) ANI0/P10 to ANI3/P13

- <1> The analog input pins (ANI0 to ANI3) also function as input port pins (P10 to P13).  
When A/D conversion is performed with any of pins ANI0 to ANI3 selected, do not access port 1 while conversion is in progress, as this may reduce the conversion resolution.
- <2> If digital pulses are applied to a pin adjacent to the pin in the process of A/D conversion, the expected A/D conversion value may not be obtainable due to coupling noise. Therefore, avoid applying pulses to pins adjacent to the pin undergoing A/D conversion.

**(5) AVREF pin input impedance**

A series resistor string of several 10 k $\Omega$  is connected between the AVREF pin and the AVSS pin. Therefore, when the output impedance of the reference voltage is too high, it seems as if the AVREF pin and the series resistor string are connected in series. This may cause a greater reference voltage error.

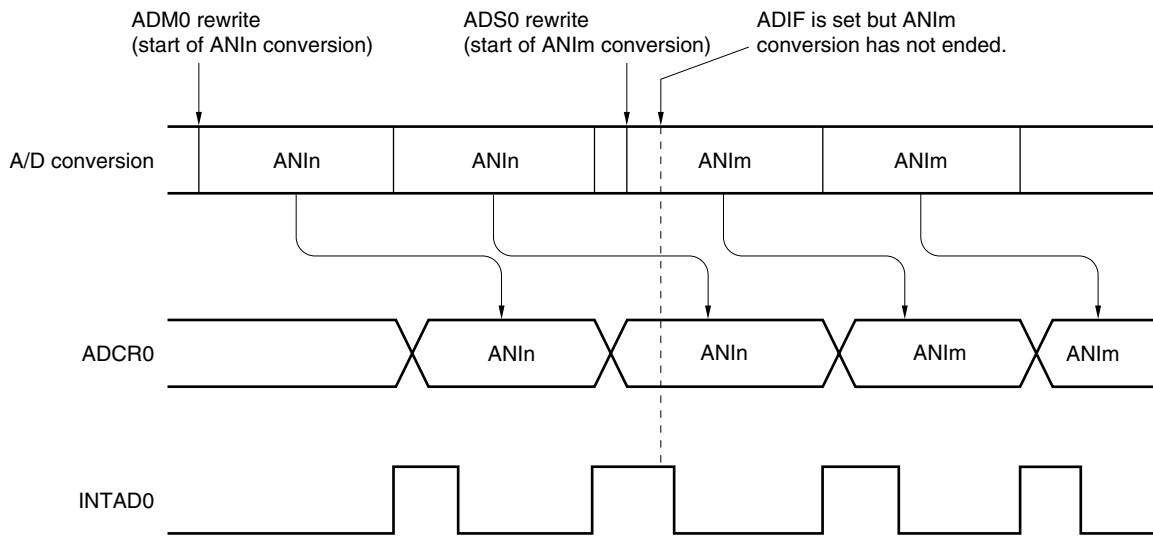

**(6) Interrupt request flag (ADIF0)**

The interrupt request flag (ADIF0) is not cleared even if analog input channel specification register 0 (ADS0) is changed.

Therefore, if an analog input pin is changed during A/D conversion, the A/D conversion result and conversion end interrupt request flag for the pre-change analog input may be set just before the ADS0 rewrite. Caution is therefore required since, at this time, when ADIF0 is read immediately just after the ADS0 rewrite, ADIF0 is set despite the fact that the A/D conversion for the post-change analog input has not ended.

When A/D conversion is restarted after it is stopped, clear ADIF0 before restart.

**Figure 12-16. A/D Conversion End Interrupt Request Generation Timing**

- Remarks 1.** n = 0, 1, ....., 3
- 2.** m = 0, 1, ....., 3

**(7) Conversion results just after A/D conversion start**

The A/D conversion value just after A/D conversion operations start may not fall within the rating. Polling A/D conversion end interrupt request (INTAD0) and take measures such as removing the first conversion results.

**(8) A/D conversion result register 0 (ADCR0) read operation**

When writing is performed to A/D converter mode register 0 (ADM0) and analog input channel specification register 0 (ADS0), the contents of ADCR0 may become undefined. Read the conversion result following conversion completion before writing to ADM0, ADS0. Using a timing other than the above may cause an incorrect conversion result to be read.

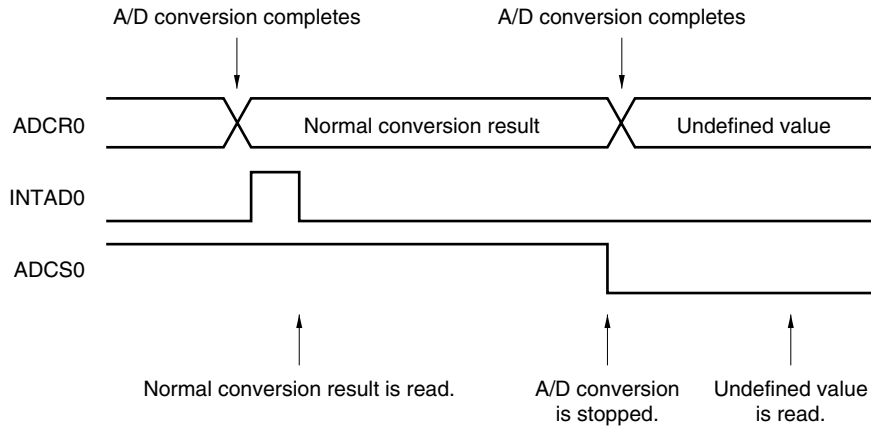

**(9) Timing at which A/D conversion result is undefined**

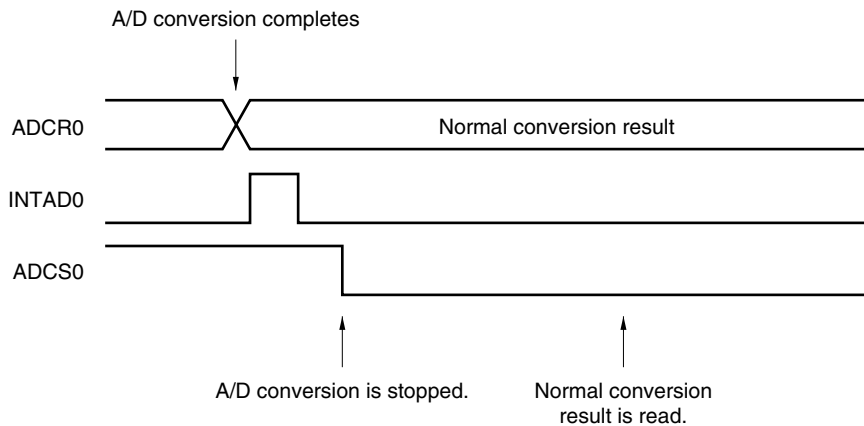

The A/D conversion value may be undefined if the timing of completion of A/D conversion and the timing of stopping the A/D conversion conflict with each other. Therefore, read the A/D conversion result during the A/D conversion operation. To read the conversion result after stopping the A/D conversion operation, be sure to stop the A/D conversion before the next conversion ends.

Figures 12-17 and 12-18 show the timing of reading the conversion result.

**Figure 12-17. Timing of Reading Conversion Result (When Conversion Result Is Undefined)**

**Figure 12-18. Timing of Reading Conversion Result (When Conversion Result Is Normal)**

**(10) Notes on board design**

Locate analog circuits as far away from digital circuits as possible on the board because the analog circuits may be affected by the noise of the digital circuits. In particular, do not cross an analog signal line with a digital signal line, or wire an analog signal line in the vicinity of a digital signal line. Otherwise, the A/D conversion characteristics may be affected by the noise of the digital line.

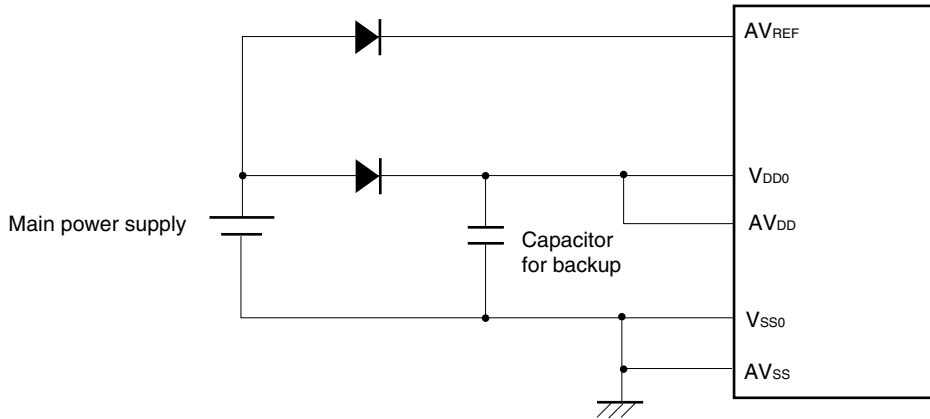

Connect AV<sub>SS0</sub> and V<sub>SS0</sub> at one location on the board where the voltages are stable.

**(11) AV<sub>DD</sub> pin**

The AV<sub>DD</sub> pin is the analog circuit power supply pin. It supplies power to the input circuits of the ANI0 to ANI3 pins.

Therefore, be sure to apply the same potential as V<sub>DD0</sub> to this pin even for applications designed to switch to a backup battery for power supply.

**Figure 12-19. AV<sub>DD</sub> Pin Connection**

**(12) AV<sub>REF</sub> pin**

Connect a capacitor to the AV<sub>REF</sub> pin to minimize conversion errors due to noise. If an A/D conversion operation has been stopped and then is started, the voltage applied to the AV<sub>REF</sub> pin becomes unstable, causing the accuracy of the A/D conversion to drop. To prevent this, also connect a capacitor to the AV<sub>REF</sub> pin. Figure 12-20 shows an example of connecting a capacitor.

★

**Figure 12-20. Example of Connecting Capacitor to AV<sub>REF</sub> Pin**

**Remark** C1: 4.7  $\mu$ F to 10  $\mu$ F (reference value)  
 C2: 0.01  $\mu$ F to 0.1  $\mu$ F (reference value)  
 Connect C2 as close to the pin as possible.

**(13) Internal equivalent circuit of ANI0 to ANI3 pins and permissible signal source impedance**

To complete sampling within the sampling time with sufficient A/D conversion accuracy, the impedance of the signal source such as a sensor must be sufficiently low. Figure 12-21 shows the internal equivalent circuit of the ANI0 to ANI3 pins.

If the impedance of the signal source is high, connect capacitors with a high capacitance to the pins ANI0 to ANI3. An example of this is shown in Figure 12-22. In this case, however, the microcontroller cannot follow an analog signal with a high differential coefficient because a lowpass filter is created.

To convert a high-speed analog signal or to convert an analog signal in the scan mode, insert a low-impedance buffer.

**Figure 12-21. Internal Equivalent Circuit of Pins ANI0 to ANI3**

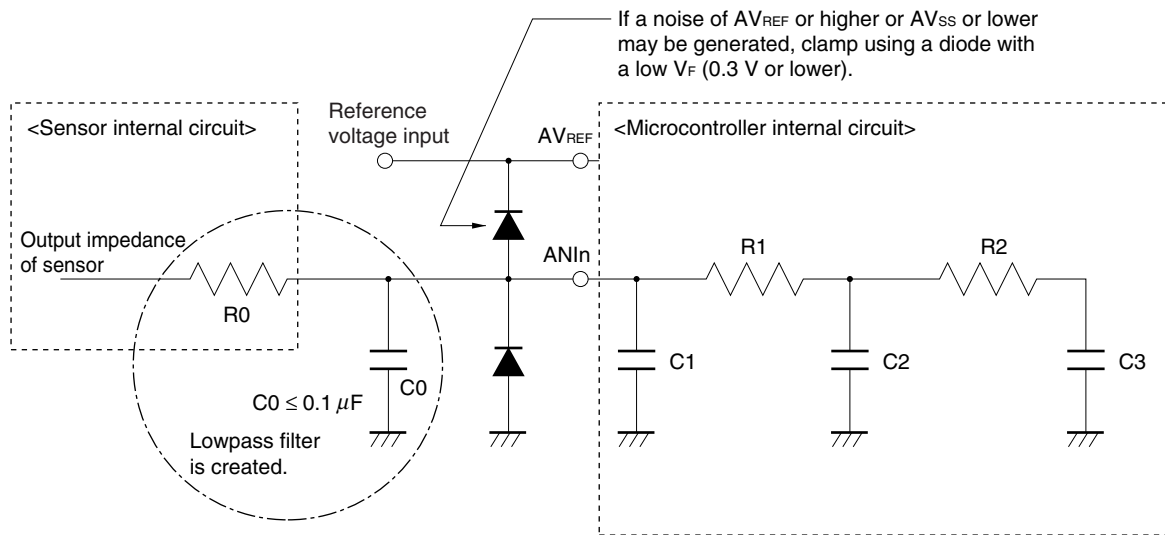

**Remark** n = 0 to 3

★ **Table 12-3. Resistance and Capacitance of Equivalent Circuit (Reference Values)**

$A_{VREF}$	R1	R2	C1	C2	C3
2.7 V	12 k $\Omega$	8 k $\Omega$	3 pF	3 pF	2 pF
4.5 V	4 k $\Omega$	2.7 k $\Omega$	3 pF	1.4 pF	2 pF

**Caution** The resistance and capacitance in Table 12-3 are not guaranteed values.

★ **Figure 12-22. Example of Connection When Signal Source Impedance Is High**

**Remark**  $n = 0$  to 3

★ **(14) Input impedance of ANI0 to ANI3 pins**

This A/D converter executes sampling by charging the internal sampling capacitor for approximately 1/10 of the conversion time.

Therefore, only the leakage current flows during other than sampling, and the current for charging the capacitor flows during sampling. The input impedance therefore varies and has no meaning.

To achieve sufficient sampling, it is recommended that the output impedance of the analog input source be 10 k $\Omega$  or less, or attach a capacitor of around 100 pF to the ANI0 to ANI3 pins (see **Figure 12-22**).

### 13.1 Functions of Serial Interface UART0

Serial interface UART0 has the following three modes.

**(1) Operation stop mode**

This mode is used when serial transfers are not performed to reduce power consumption.

For details, see **13.4.1 Operation stop mode**.

**(2) Asynchronous serial interface (UART) mode (fixed to LSB first)**

This mode enables full-duplex operation wherein one byte of data after the start bit is transmitted and received.

★ The on-chip baud rate generator dedicated to UART enables communications using a wide range of selectable baud rates. The communication range is between 1.2 kbps and 131 kbps (when operated at  $f_x = 8.38$  MHz). In addition, a baud rate (39 kbps max. (when operated at  $f_x = 1.25$  MHz)) can also be defined by dividing the clock input to the ASCK0 pin.

The UART baud rate generator can also be used to generate a MIDI-standard baud rate (31.25 kbps).

For details, see **13.4.2 Asynchronous serial interface (UART) mode**.

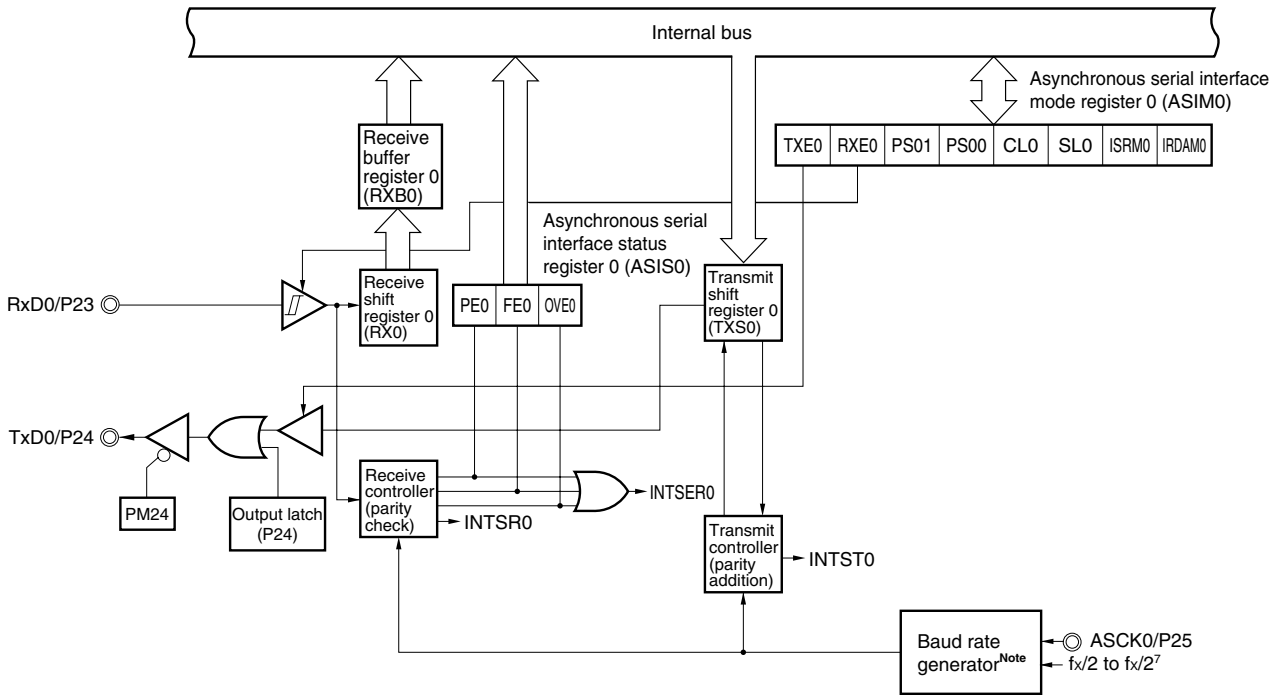

**(3) Infrared data transfer mode**

For details, see **13.4.3 Infrared data transfer mode**.

Figure 13-1 shows a block diagram of serial interface UART0.

★

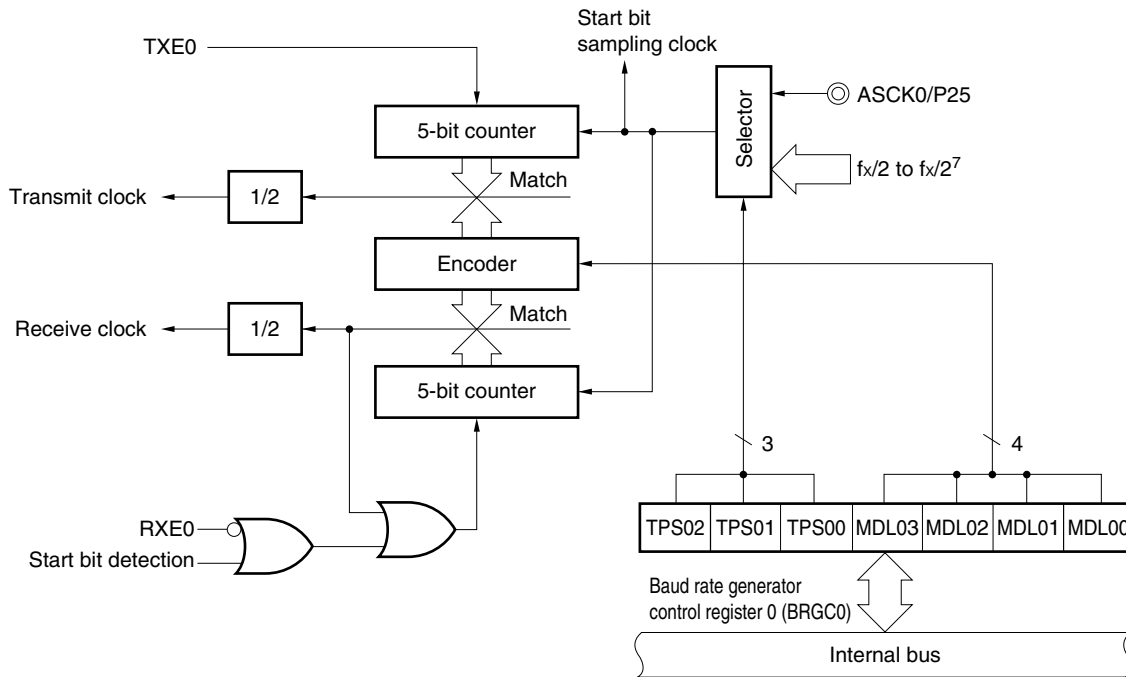

Figure 13-1. Block Diagram of Serial Interface UART0

**Note** For the configuration of the baud rate generator, refer to **Figure 13-2**.

★

Figure 13-2. Block Diagram of Baud Rate Generator

**Remark** TXE0: Bit 7 of asynchronous serial interface mode register 0 (ASIM0)  
 RXE0: Bit 6 of asynchronous serial interface mode register 0 (ASIM0)

## 13.2 Configuration of Serial Interface UART0

Serial interface UART0 includes the following hardware.

**Table 13-1. Configuration of Serial Interface UART0**

Item	Configuration
Registers	Transmit shift register 0 (TXS0) Receive shift register 0 (RX0) Receive buffer register 0 (RXB0) Asynchronous serial interface status register 0 (ASIS0)
Control registers	Asynchronous serial interface mode register 0 (ASIM0) Baud rate generator control register 0 (BRGC0) Port mode register 2 (PM2) Port 2 (P2)

### (1) Transmit shift register 0 (TXS0)

This is the register for setting transmit data. Data written to TXS0 is transmitted as serial data. When the data length is set as 7 bits, bits 0 to 6 of the data written to TXS0 are transferred as transmit data. Writing data to TXS0 starts the transmit operation. TXS0 can be written by an 8-bit memory manipulation instruction. It cannot be read.  $\overline{\text{RESET}}$  input sets TXS0 to FFH.

**Caution** Do not write to TXS0 during a transmit operation. The same address is assigned to TXS0 and receive buffer register 0 (RXB0). A read operation reads values from RXB0.

### (2) Receive shift register 0 (RX0)

This register converts serial data input via the RxD0 pin to parallel data. When one byte of data is received at this register, the receive data is transferred to receive buffer register 0 (RXB0). RX0 cannot be manipulated directly by a program.

### (3) Receive buffer register 0 (RXB0)

This register is used to hold receive data. When one byte of data is received, one byte of new receive data is transferred from receive shift register 0 (RX0). When the data length is set as 7 bits, receive data is sent to bits 0 to 6 of RXB0. In this case, the MSB of RXB0 always becomes 0. RXB0 can be read by an 8-bit memory manipulation instruction. It cannot be written to.  $\overline{\text{RESET}}$  input sets RXB0 to FFH.

**Caution** The same address is assigned to RXB0 and transmit shift register 0 (TXS0). During a write operation, values are written to TXS0.

**(4) Asynchronous serial interface status register 0 (ASIS0)**

When a receive error occurs in UART mode, this register indicates the type of error.

ASIS0 can be read by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ASIS0 to 00H.

**Figure 13-3. Format of Asynchronous Serial Interface Status Register 0 (ASIS0)**

Address: FFA1H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
ASIS0	0	0	0	0	0	PE0	FE0	OVE0

PE0	Parity error flag
0	No parity error
1	Parity error (Transmit data parity not matched)

FE0	Framing error flag
0	No framing error
1	Framing error <sup>Note 1</sup> (Stop bit not detected)

OVE0	Overrun error flag
0	No overrun error
1	Overrun error <sup>Note 2</sup> (Next receive operation was completed before data was read from receive buffer register 0 (RXB0))

- Notes**
1. Even if the stop bit length is set to two bits by setting bit 2 (SL0) of asynchronous serial interface mode register 0 (ASIM0), stop bit detection during a receive operation only applies to a stop bit length of 1 bit.
  2. When an overrun error has occurred, further overrun errors will continue to occur until the contents of receive buffer register 0 (RXB0) are read.

**(5) Transmit controller**

The transmit controller controls transmit operations, such as adding a start bit, parity bit, and stop bit to data that is written to transmit shift register 0 (TXS0), based on the values set to asynchronous serial interface mode register 0 (ASIM0).

**(6) Receive controller**

The receive controller controls receive operations based on the values set to asynchronous serial interface mode register 0 (ASIM0). During a receive operation, it performs error checking, such as for parity errors, and sets various values to asynchronous serial interface status register 0 (ASIS0) according to the type of error that is detected.

### 13.3 Registers Controlling Serial Interface UART0

The following four registers are used to control serial interface UART0.

- Asynchronous serial interface mode register 0 (ASIM0)
- Baud rate generator control register 0 (BRGC0)
- Port mode register 2 (PM2)
- Port 2 (P2)

#### (1) Asynchronous serial interface mode register 0 (ASIM0)

This is an 8-bit register that controls serial interface UART0's serial transfer operations.

ASIM0 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ASIM0 to 00H.

Figure 13-4 shows the format of ASIM0.

Figure 13-4. Format of Asynchronous Serial Interface Mode Register 0 (ASIM0)

Address: FFA0H After reset: 00H R/W

Symbol	<7>	<6>	5	4	3	2	1	0
ASIM0	TXE0	RXE0	PS01	PS00	CL0	SL0	ISRM0	IRDAM0

TXE0	RXE0	Operation mode	RxD0/P23 pin function	TxD0/P24 pin function
0	0	Operation stop	Port function (P23)	Port function (P24)
0	1	UART mode (receive only)	Serial function (RxD0)	
1	0	UART mode (transmit only)	Port function (P23)	Serial function (TxD0)
1	1	UART mode (transmit and receive)	Serial function (RxD0)	

PS01	PS00	Parity bit specification
0	0	No parity
0	1	Zero parity always added during transmission No parity detection during reception (parity errors do not occur)
1	0	Odd parity
1	1	Even parity

CL0	Character length specification
0	7 bits
1	8 bits

SL0	Stop bit length specification for transmit data
0	1 bit
1	2 bits

ISRM0	Receive completion interrupt control when error occurs
0	Receive completion interrupt request is issued when an error occurs
1	Receive completion interrupt request is not issued when an error occurs

IRDAM0	Operation specified for infrared data transfer mode <sup>Note 1</sup>
0	UART (transmit/receive) mode
1	Infrared data transfer (transmit/receive) mode <sup>Note 2</sup>

- Notes**
1. The UART/infrared data transfer mode specification is controlled by TXE0 and RXE0.
  2. When using infrared data transfer mode, be sure to set baud rate generator control register 0 (BRGC0) to 10H.

★ **Caution** Stop operation before writing different data to ASIM0.

**(2) Baud rate generator control register 0 (BRGC0)**

This register sets the serial clock for serial interface.

BRGC0 is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears BRGC0 to 00H.

Figure 13-5 shows the format of BRGC0.

**Figure 13-5. Format of Baud Rate Generator Control Register 0 (BRGC0)**

Address: FFA2H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0

1	1	1	0	$f_{\text{SCK0}}/30$	14
1	1	1	1	Setting prohibited	—

- Cautions**
1. Writing to BRGC0 during a communication operation may cause abnormal output from the baud rate generator and disable further communication operations. Therefore, do not write to BRGC0 during a communication operation.
  2. Set 10H to BRGC0 when using in infrared data transfer mode.

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2.  $f_{\text{scK0}}$ : Source clock for 5-bit counter
  3.  $n$ : Value set via TPS00 to TPS02 ( $0 \leq n \leq 7$ )
  4.  $k$ : Value set via MDL00 to MDL03 ( $0 \leq k \leq 14$ )
  5. The equation for the baud rate is as follows.

★

$$[\text{Baud rate}] = \frac{f_x}{2^{n+1}(k + 16)} \text{ [Hz]}$$

★ (3) **Port mode register 2 (PM2)**

Port mode register 2 is used to set input/output of port 2 in 1-bit units.  
 To use the P24/TxD0 pin as a serial data output, clear PM24 and the output latch of P24 to 0.  
 To use the P23/RxD0 pin as a serial data input, and the P25/ASCK0 pin as a clock input, set PM23 and PM25 to 1. At this time, the output latches of P23 and P25 can be either 0 or 1.  
 PM2 is set by a 1-bit or 8-bit memory manipulation instruction.  
 $\overline{\text{RESET}}$  input sets PM2 to FFH.

**Figure 13-6. Format of Port Mode Register 2 (PM2)**

0	Output mode (output buffer on)
1	Input mode (output buffer off)

## 13.4 Operations of Serial Interface UART0

This section explains the three modes of serial interface UART0.

### 13.4.1 Operation stop mode

Because serial transfer is not performed during this mode, the power consumption can be reduced. In addition, pins can be used as normal ports.

#### (1) Register to be used

Operation stop mode is set by asynchronous serial interface mode register 0 (ASIM0).

ASIM0 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ASIM0 to 00H.

Address: FFA0H After reset: 00H R/W

Symbol	<7>	<6>	5	4	3	2	1	0
ASIM0	TXE0	RXE0	PS01	PS00	CL0	SL0	ISRM0	IRDAM0

TXE0	RXE0	Operation mode	RxD0/P23 pin function	TxD0/P24 pin function
0	0	Operation stop	Port function (P23)	Port function (P24)

### 13.4.2 Asynchronous serial interface (UART) mode

This mode enables full-duplex operation wherein one byte of data after the start bit is transmitted or received.

The on-chip baud rate generator dedicated to UART enables communications using a wide range of selectable baud rates. The communication range is between 1.2 kbps and 131 kbps (when operated at  $f_x = 8.38$  MHz). The baud rate (39 kbps max. (when operated of  $f_x = 1.25$  MHz)) can be defined by dividing the input clock to the ASCK0 pin.

The UART baud rate generator can also be used to generate a MIDI-standard baud rate (31.25 kbps).

#### (1) Registers to be used

- Asynchronous serial interface mode register 0 (ASIM0)
- Asynchronous serial interface status register 0 (ASIS0)
- Baud rate generator control register 0 (BRGC0)
- Port mode register 2 (PM2)
- Port 2 (P2)

#### (a) Asynchronous serial interface mode register 0 (ASIM0)

ASIM0 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ASIM0 to 00H.

Address: FFA0H After reset: 00H R/W

Symbol	<7>	<6>	5	4	3	2	1	0
ASIM0	TXE0	RXE0	PS01	PS00	CL0	SL0	ISRM0	IRDAM0

TXE0	RXE0	Operation mode	RxD0/P23 pin function	TxD0/P24 pin function
0	0	Operation stop	Port function (P23)	Port function (P24)
0	1	UART mode (receive only)	Serial function (RxD0)	
1	0	UART mode (transmit only)	Port function (P23)	Serial function (TxD0)
1	1	UART mode (transmit and receive)	Serial function (RxD0)	

PS01	PS00	Parity bit specification
0	0	No parity
0	1	Zero parity always added during transmission No parity detection during reception (parity errors do not occur)
1	0	Odd parity
1	1	Even parity

CL0	Character length specification
0	7 bits
1	8 bits

SL0	Stop bit length specification for transmit data
0	1 bit
1	2 bits

ISRM0	Receive completion interrupt control when error occurs
0	Receive completion interrupt request is issued when an error occurs
1	Receive completion interrupt request is not issued when an error occurs

IRDAM0	Operation specified for infrared data transfer mode <sup>Note 1</sup>
0	UART (transmit/receive) mode
1	Infrared data transfer (transmit/receive) mode <sup>Note 2</sup>

- Notes**
1. The UART/infrared data transfer mode specification is controlled by TXE0 and RXE0.
  2. When using infrared data transfer mode, be sure to set baud rate generator control register 0 (BRGC0) to 10H.

★ **Caution** Stop operation before writing different data to ASIM0.

**(b) Asynchronous serial interface status register 0 (ASIS0)**

ASIS0 can be read by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ASIS0 to 00H.

Address: FFA1H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
ASIS0	0	0	0	0	0	PE0	FE0	OVE0

PE0	Parity error flag
0	No parity error
1	Parity error (Transmit data parity not matched)

FE0	Framing error flag
0	No framing error
1	Framing error <sup>Note 1</sup> (Stop bit not detected)

OVE0	Overrun error flag
0	No overrun error
1	Overrun error <sup>Note 2</sup> (Next receive operation was completed before data was read from receive buffer register 0 (RXB0))

**Notes 1.** Even if a stop bit length is set to 2 bits by setting bit 2 (SL0) in asynchronous serial interface mode register 0 (ASIM0), stop bit detection during a receive operation only applies to a stop bit length of 1 bit.

**2.** When an overrun error has occurred, further overrun errors will continue to occur until the contents of receive buffer register 0 (RXB0) are read.

**(c) Baud rate generator control register 0 (BRGC0)**

BRGC0 is set by an 8-bit memory manipulation instruction.

RESET input clears BRGC0 to 00H.

Address: FFA2H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
BRGC0	0	TPS02	TPS01	TPS00	MDL03	MDL02	MDL01	MDL00

(fx = 8.38 MHz)

TPS02	TPS01	TPS00	Source clock selection for 5-bit counter	n
0	0	0	External clock input to ASCK0	0
0	0	1	$f_x/2$	1
0	1	0	$f_x/2^2$	2
0	1	1	$f_x/2^3$	3
1	0	0	$f_x/2^4$	4
1	0	1	$f_x/2^5$	5
1	1	0	$f_x/2^6$	6
1	1	1	$f_x/2^7$	7

MDL03	MDL02	MDL01	MDL00	Output clock selection for baud rate generator	k
0	0	0	0	$f_{sck0}/16$	0
0	0	0	1	$f_{sck0}/17$	1
0	0	1	0	$f_{sck0}/18$	2
0	0	1	1	$f_{sck0}/19$	3
0	1	0	0	$f_{sck0}/20$	4
0	1	0	1	$f_{sck0}/21$	5
0	1	1	0	$f_{sck0}/22$	6
0	1	1	1	$f_{sck0}/23$	7
1	0	0	0	$f_{sck0}/24$	8
1	0	0	1	$f_{sck0}/25$	9
1	0	1	0	$f_{sck0}/26$	10
1	0	1	1	$f_{sck0}/27$	11
1	1	0	0	$f_{sck0}/28$	12
1	1	0	1	$f_{sck0}/29$	13
1	1	1	0	$f_{sck0}/30$	14
1	1	1	1	Setting prohibited	—

**Caution** Writing to BRGC0 during a communication operation may cause abnormal output from the baud rate generator and disable further communication operations. Therefore, do not write to BRGC0 during a communication operation.

- Remarks**
1. fx: Main system clock oscillation frequency
  2. fsck0: Source clock for 5-bit counter
  3. n: Value set via TPS00 to TPS02 ( $0 \leq n \leq 7$ )
  4. k: Value set via MDL00 to MDL03 ( $0 \leq k \leq 14$ )

The transmit/receive clock that is used to generate the baud rate is obtained by dividing the main system clock.

- Transmit/receive clock generation for baud rate by using main system clock  
The main system clock is divided to generate the transmit/receive clock. The baud rate generated from the main system clock is determined according to the following formula.

$$[\text{Baud rate}] = \frac{f_x}{2^{n+1}(k + 16)} \quad [\text{Hz}]$$

$f_x$ : Main system clock oscillation frequency

When ASCK0 is selected as the source clock of the 5-bit counter, substitute the input clock frequency to the ASCK0 pin for  $f_x$  in the above expression.

$n$ : Value set via TPS00 to TPS02 ( $0 \leq n \leq 7$ )

$k$ : Value set via MDL00 to MDL03 ( $0 \leq k \leq 14$ )

**Table 13-2. Relationship Between Main System Clock and Baud Rate Error**

Baud Rate (bps)	$f_x = 8.3886 \text{ MHz}$		$f_x = 8.000 \text{ MHz}$		$f_x = 7.3728 \text{ MHz}$		$f_x = 5.000 \text{ MHz}$		$f_x = 4.1943 \text{ MHz}$	
	BRGC0	ERR (%)	BRGC0	ERR (%)	BRGC0	ERR (%)	BRGC0	ERR (%)	BRGC0	ERR (%)
600	–	–	–	–	–	–	–	–	7BH	1.14

38400	2BH	1.10	2AH	0.16	28H	0	20H	1.73	1BH	1.14
76800	1BH	1.10	1AH	0.16	18H	0	10H	1.73	–	–
115200	12H	1.10	11H	2.12	10H	0	–	–	–	–

**Remark**  $f_x$ : Main system clock oscillation frequency

• **Error tolerance range for baud rate**

The error for the baud rate depends on the number of bits per frame and the 5-bit counter's division ratio  $[1/(16 + k)]$ .

Figure 13-7 shows an example of the baud rate error tolerance range.

Figure 13-7. Error Tolerance (When k = 0), Including Sampling Errors

$$\text{Baud rate error tolerance (when } k = 0) = \frac{\pm 15.5}{320} \times 100 = 4.8438 \%$$

★ **Caution** The above error tolerance value is the value calculated based on the ideal sample point. In the actual design, allow margins that include errors of timing for detecting a start bit.

**Remark** T: 5-bit counter's source clock cycle

★ (d) **Port mode register 2 (PM2)**

Port mode register 2 is used to set input/output of port 2 in 1-bit units.

To use the P24/TxD0 pin as a serial data output, clear PM24 and the output latch of P24 to 0.

To use the P23/RxD0 pin as a serial data input, and the P25/ASCK0 pin as a clock input, set PM23 and PM25 to 1. At this time, the output latches of P23 and P25 can be either 0 or 1.

PM2 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets PM2 to FFH.

Address: FF22H After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0
PM2	1	1	PM25	PM24	PM23	PM22	PM21	PM20

PM2n	P2n pin I/O mode selection (n = 0 to 5)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

**(2) Communication operations****(a) Data format**

Figure 13-8 shows the format of the transmit/receive data.

**Figure 13-8. Format of Transmit/Receive Data in Asynchronous Serial Interface**

1 data frame consists of the following bits.

- Start bit ..... 1 bit
- Character bits ... 7 bits or 8 bits (LSB first)
- Parity bit ..... Even parity, odd parity, zero parity, or no parity
- Stop bit(s) ..... 1 bit or 2 bits

Asynchronous serial interface mode register 0 (ASIM0) is used to set the character bit length, parity selection, and stop bit length within each data frame.

When “7 bits” is selected as the number of character bits, only the lower 7 bits (bits 0 to 6) are valid, so that during a transmission the highest bit (bit 7) is ignored and during reception the highest bit (bit 7) must be cleared to 0.

Baud rate generator control register 0 (BRGC0) is used to set the serial transfer rate.

If a receive error occurs, information about the receive error can be recognized by reading asynchronous serial interface status register 0 (ASIS0).

**(b) Parity types and operations**

The parity bit is used to detect bit errors in communication data. Usually, the same type of parity bit is used by the transmitting and receiving sides. When odd parity or even parity is set, errors in the parity bit (the odd-number bit) can be detected. When zero parity or no parity is set, errors are not detected.

**(i) Even parity**

- During transmission

The number of bits in transmit data that includes a parity bit is controlled so that there are an even number of character bits whose value is 1. The value of the parity bit is as follows.

If the transmit data contains an odd number of character bits whose value is 1: the parity bit is "1"

If the transmit data contains an even number of character bits whose value is 1: the parity bit is "0"

- During reception

The number of character bits whose value is 1 is counted among the receive data that include a parity bit, and a parity error occurs when the counted result is an odd number.

**(ii) Odd parity**

- During transmission

The number of character bits in transmit data that includes a parity bit is controlled so that there is an odd number of bits whose value is 1. The value of the parity bit is as follows.

If the transmit data contains an odd number of character bits whose value is 1: the parity bit is "0"

If the transmit data contains an even number of character bits whose value is 1: the parity bit is "1"

- During reception

The number of character bits whose value is 1 is counted among the receive data that include a parity bit, and a parity error occurs when the counted result is an even number.

**(iii) Zero parity**

During transmission, the parity bit is set to "0" regardless of the transmit data.

During reception, the parity bit is not checked. Therefore, no parity errors will occur regardless of whether the parity bit is a "0" or a "1".

**(iv) No parity**

No parity bit is added to the transmit data.

During reception, receive data is regarded as having no parity bit. Since there is no parity bit, no parity errors will occur.

**(c) Transmission**

The transmit operation is enabled when bit 7 (TXE0) of the asynchronous serial interface mode register 0 (ASIM0) is set (1). The transmit operation is started when transmit data is written to transmit shift register 0 (TXS0). A start bit, parity bit, and stop bit(s) are automatically added to the data.

Starting the transmit operation shifts out the data in TXS0, thereby emptying TXS0, after which a transmit completion interrupt request (INTST0) is issued.

The timing of the transmit completion interrupt request is shown in Figure 13-9.

**Figure 13-9. Timing of Asynchronous Serial Interface Transmit Completion Interrupt Request**

**(i) Stop bit length: 1 bit****(ii) Stop bit length: 2 bits**

**Caution** Do not rewrite to asynchronous serial interface mode register 0 (ASIM0) during a transmit operation. Rewriting ASIM0 register during a transmit operation may disable further transmit operations (in such cases, input a **RESET** to restore normal operation).

**(d) Reception**

- ★ The receive operation performs level detection.
- The receive operation is enabled when “1” is set to bit 6 (RXE0) of asynchronous serial interface mode register 0 (ASIM0), and the input via the RxD0 pin is sampled.
- The serial clock specified by baud rate generator control register 0 (BRGC0) is used to sample the RxD0 pin.
- When the RxD0 pin goes low, the 5-bit counter of the baud rate generator begins counting and the start timing signal for data sampling is output when half of the specified baud rate time has elapsed. If sampling the RxD0 pin input at this start timing signal yields a low-level result, a start bit is recognized, after which the 5-bit counter is initialized and starts counting and data sampling begins. After the start bit is recognized, the character data, parity bit, and one-bit stop bit are detected, at which point reception of one data frame is completed.
- Once reception of one data frame is completed, the receive data in the shift register is transferred to receive buffer register 0 (RXB0) and INTSR0 (receive completion interrupt request) occurs.
- If the RXE0 bit is reset (to 0) during a receive operation, the receive operation is stopped immediately. At this time, the contents of RXB0 and ASIS0 do not change, nor does INTSR0 or INTSER0 (receive error interrupt request) occur.
- Figure 13-10 shows the timing of the asynchronous serial interface receive completion interrupt request.

**Figure 13-10. Timing of Asynchronous Serial Interface Receive Completion Interrupt Request**

- ★ **Caution** If the receive operation is enabled with the RxD0 pin input at the low level, the receive operation is immediately started. Make sure the RxD0 pin input is at the high level before enabling the receive operation.

**(e) Receive errors**

Three types of errors can occur during a receive operation: parity error, framing error, or overrun error. If, as the result of data reception, an error flag is set to asynchronous serial interface status register 0 (ASIS0), a receive error interrupt request (INTSER0) will occur. Receive error interrupt requests are generated before receive completion interrupt request (INTSR0). Table 13-3 lists the causes behind receive errors.

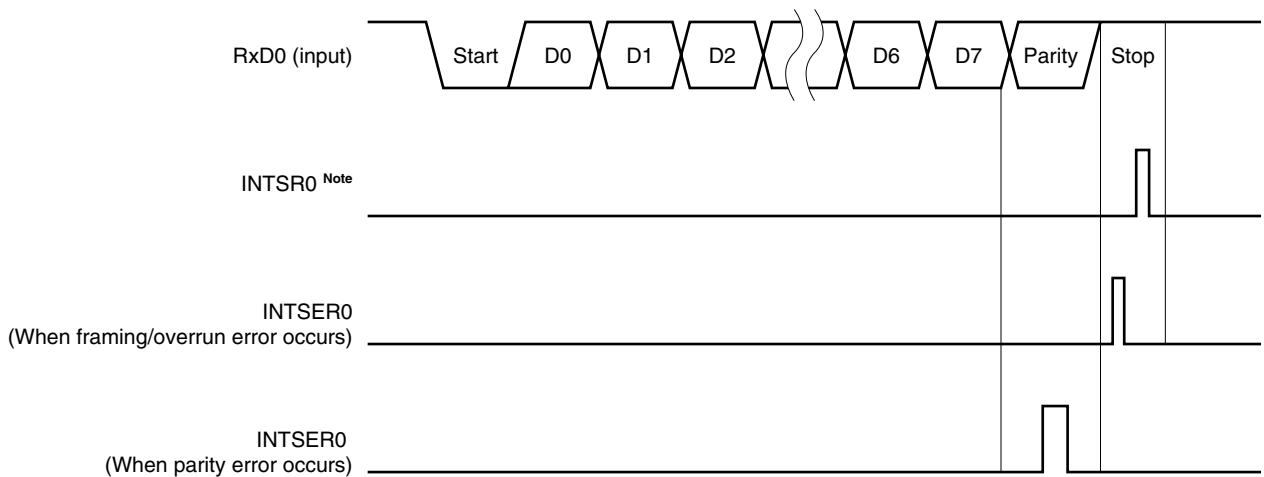

As part of receive error interrupt request (INTSER0) servicing, the contents of ASIS0 can be read to determine which type of error occurred during the receive operation (see **Table 13-3** and **Figure 13-11**).

The contents of ASIS0 are reset (0) when receive buffer register 0 (RXB0) is read or when the next data is received (if the next data contains an error, its error flag will be set).

**Table 13-3. Causes of Receive Errors**

Receive Error	Cause	ASIS0 Value
Parity error	Parity specified does not match parity of receive data	04H
Framing error	Stop bit was not detected	02H
Overrun error	Reception of the next data was completed before data was read from receive buffer register 0 (RXB0)	01H

**Figure 13-11. Receive Error Timing**

**Note** If a receive error occurs when ISRM0 bit has been set (1), INTSR0 does not occur.

**Cautions** 1. The contents of asynchronous serial interface status register 0 (ASIS0) are reset (0) when receive buffer register 0 (RXB0) is read or when the next data is received. To obtain information about the error, be sure to read the contents of ASIS0 before reading RXB0.

2. Be sure to read the contents of receive buffer register 0 (RXB0) after the receive completion interrupt request has occurred even when a receive error has occurred; otherwise overrun errors will occur during the next data receive operations and the receive error status will remain until the contents of RXB0 are read.

### 13.4.3 Infrared data transfer mode

In infrared data transfer mode, pulses can be output and received in the data format shown in (2).

★ (1) **Registers to be used**

- Asynchronous serial interface mode register 0 (ASIM0)
- Asynchronous serial interface status register 0 (ASIS0)
- Baud rate generator control register 0 (BRGC0)
- Port mode register 2 (PM2)
- Port 2 (P2)

(a) **Asynchronous serial interface mode register 0 (ASIM0)**

ASIM0 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ASIM0 to 00H.

Address: FFA0H After reset: 00H R/W

Symbol	<7>	<6>	5	4	3	2	1	0
ASIM0	TXE0	RXE0	PS01	PS00	CL0	SL0	ISRM0	IRDAM0

TXE0	RXE0	Operation mode	RxD0/P23 pin function	TxD0/P24 pin function
0	0	Operation stop	Port function (P23)	Port function (P24)
0	1	UART mode (receive only)	Serial function (RxD0)	Serial function (TxD0)
1	0	UART mode (transmit only)	Port function (P23)	
1	1	UART mode (transmit and receive)	Serial function (RxD0)	

PS01	PS00	Parity bit specification
0	0	No parity
0	1	Zero parity always added during transmission No parity detection during reception (parity errors do not occur)
1	0	Odd parity
1	1	Even parity

CL0	Character length specification
0	7 bits
1	8 bits

SL0	Stop bit length specification for transmit data
0	1 bit
1	2 bits

ISRM0	Receive completion interrupt control when error occurs
0	Receive completion interrupt request is issued when an error occurs
1	Receive completion interrupt request is not issued when an error occurs

IRDAM0	Operation specified for infrared data transfer mode <sup>Note 1</sup>
0	UART (transmit/receive) mode
1	Infrared data transfer (transmit/receive) mode <sup>Note 2</sup>

- Notes**
1. The UART/infrared data transfer mode specification is controlled by TXE0 and RXE0.
  2. When using infrared data transfer mode, be sure to set baud rate generator control register 0 (BRGC0) to "10H".

★ **Caution** Stop operation before writing different data to ASIM0.

**(b) Asynchronous serial interface status register 0 (ASIS0)**

ASIS0 can be read by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears ASIS0 to 00H.

Address: FFA1H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
ASIS0	0	0	0	0	0	PE0	FE0	OVE0

PE0	Parity error flag
0	No parity error
1	Parity error (Incorrect parity bit detected)

FE0	Framing error flag
0	No framing error
1	Framing error <sup>Note 1</sup> (Stop bit not detected)

OVE0	Overrun error flag
0	No overrun error
1	Overrun error <sup>Note 2</sup> (Next receive operation was completed before data was read from receive buffer register 0 (RXB0))

**Notes** 1. Even if the stop bit length is set to two bits by setting bit 2 (SL0) of asynchronous serial interface mode register 0 (ASIM0), stop bit detection during a receive operation only applies to a stop bit length of 1 bit.

2. When an overrun error has occurred, further overrun errors will continue to occur until the contents of receive buffer register 0 (RXB0) are read.

**(c) Baud rate generator control register 0 (BRGC0)**

BRGC0 is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears BRGC0 to 00H.

Address: FFA2H After reset: 00H R/W

1	0	1	0	$f_{sck0}/26$	10
1	0	1	1	$f_{sck0}/27$	11
1	1	0	0	$f_{sck0}/28$	12
1	1	0	1	$f_{sck0}/29$	13
1	1	1	0	$f_{sck0}/30$	14
1	1	1	1	Setting prohibited	—

- Cautions**
1. Writing to BRGC0 during a communication operation may cause abnormal output from the baud rate generator and disable further communication operations. Therefore, do not write to BRGC0 during a communication operation.
  2. Set BRGC0 to 10H when using in infrared data transfer mode.

- Remarks**
1. fx: Main system clock oscillation frequency
  2. fsck0: Source clock for 5-bit counter
  3. n: Value set via TPS00 to TPS02 ( $0 \leq n \leq 7$ )
  4. k: Value set via MDL00 to MDL03 ( $0 \leq k \leq 14$ )

**(d) Port mode register 2 (PM2)**

Port mode register 2 is used to set input/output of port 2 in 1-bit units.

To use the P24/TxD0 pin as a serial data output, set PM24 and the output latch of P24 to 0.

To use the P23/RxD0 pin as a serial data input, and the P25/ASCK0 pin as a clock input, set PM23 and PM25 to 1. At this time, the output latches of P23 and P25 can be either 0 or 1.

PM2 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets PM2 to FFH.

Address: FF22H After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0
PM2	1	1	PM25	PM24	PM23	PM22	PM21	PM20

PM2n	P2n pin I/O mode selection (n = 0 to 5)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

**(2) Data format**

Figure 13-12 compares the data format used in UART mode with that used in infrared data transfer mode.

The IR (infrared) frame corresponds to the bit string of the UART frame, which consists of pulses that include a start bit, eight data bits, and a stop bit.

The length of the electrical pulses that are used to transmit and receive in an IR frame is 3/16 the length of the cycle time for one bit (i.e., the "bit time"). This pulse (whose width is 3/16 the length of one bit time) rises from the middle of the bit time (see the figure below).

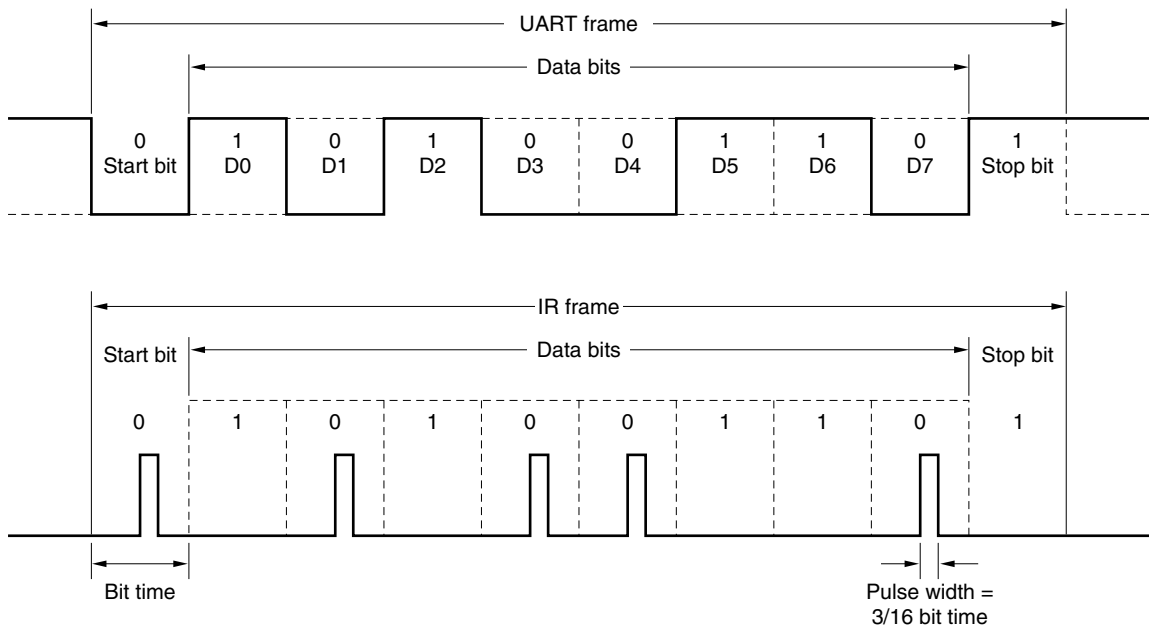

Figure 13-12. Data Format Comparison Between Infrared Data Transfer Mode and UART Mode

★ (3) Relationship between main system clock and baud rate

Table 13-4 shows the relationship between the main system clock and the baud rate.

Table 13-4. Relationship Between Main System Clock and Baud Rate

	$f_x = 8.3886 \text{ MHz}$	$f_x = 8.000 \text{ MHz}$	$f_x = 7.3728 \text{ MHz}$	$f_x = 5.000 \text{ MHz}$	$f_x = 4.1943 \text{ MHz}$
Baud rate	131031 bps	125000 bps	115200 bps	78125 bps	65536 bps

(4) Bit rate and pulse width

Table 13-5 lists the bit rate, bit rate error tolerance, and pulse width values.

Table 13-5. Bit Rate and Pulse Width Values

Bit Rate (kbps)	Bit Rate Error Tolerance (% of Bit Rate)	Pulse Width Minimum Value ( $\mu\text{s}$ ) <sup>Note 2</sup>	3/16 Pulse Width <Nominal Value> ( $\mu\text{s}$ )	Maximum Pulse Width ( $\mu\text{s}$ )
115.2 <sup>Note 1</sup>	+/- 0.87	1.41	1.63	2.71

**Notes** 1. Operation with  $f_x = 7.3728 \text{ MHz}$

2. When a digital noise eliminator is used in a microcontroller operating at 1.41 MHz or above.

**Caution** When using baud rate generator control register 0 (BRGC0) in infrared data transfer mode, set it to 10H.

**Remark**  $f_x$ : Main system clock oscillation frequency

(5) Input data and internal signals

• Transmit operation timing

• Receive operation timing

Data reception is delayed for one-half of the specified baud rate.

★ Table 13-6. Register Settings

## (1) Operation stop mode

Other than above																			Setting prohibited		

**Caution** When using the infrared data transfer mode, set the BRGC0 register to 10H.

**Remark** ×: Don't care, ASIM0: Asynchronous serial interface mode register 0  
BRGC0: Baud rate generator control register 0, PMxx: Port mode register, Pxx: Output latch of port

## CHAPTER 14 SERIAL INTERFACES SIO30 AND SIO31

### 14.1 Functions of Serial Interfaces SIO30 and SIO31

Serial interface SIO3n has the following two modes.

#### (1) Operation stop mode

This mode is used when serial transfers are not performed. For details, see **14.4.1 Operation stop mode**.

#### (2) 3-wire serial I/O mode (fixed as MSB first)

This is an 8-bit data transfer mode using three lines: a serial clock line ( $\overline{\text{SCK3n}}$ ), serial output line (SO3n), and serial input line (SI3n).

Since simultaneous transmit and receive operations are enabled in 3-wire serial I/O mode, the processing time for data transfers is reduced.

The first bit of the serial transferred 8-bit data is fixed as the MSB.

3-wire serial I/O mode is useful for connection to a peripheral IC incorporating a clocked serial interface, a display controller, etc. For details, see **14.4.2 3-wire serial I/O mode**.

Figure 14-1 shows a block diagram of serial interface SIO3n.

★

**Figure 14-1. Block Diagram of Serial Interface SIO3n**

**Note** SI30, SO30, and  $\overline{\text{SCK30}}$  pins are alternate with P20, P21, and P22 pins. SI31, SO31, and  $\overline{\text{SCK31}}$  pins are alternate with P34, P35, and P36 pins.

**Remark** n = 0 or 1

## 14.2 Configuration of Serial Interfaces SIO30 and SIO31

Serial interface SIO3n includes the following hardware.

★

**Table 14-1. Configuration of Serial Interface SIO3n**

Item	Configuration
Register	Serial I/O shift register 3n (SIO3n)
Control registers	Serial operation mode register 3n (CSIM3n) Port mode registers 2, 3 (PM2, PM3) Ports 2, 3 (P2, P3)

### (1) Serial I/O shift register 3n (SIO3n)

This is an 8-bit register that performs parallel-serial conversion and serial transmit/receive (shift operations) synchronized with the serial clock.

When 1 is set to bit 7 (CSIE3n) of serial operation mode register 3n (CSIM3n), a serial operation can be started by writing data to or reading data from SIO3n.

When transmitting, data written to SIO3n is output to the serial output (SO3n).

When receiving, data is read from the serial input (SI3n) and written to SIO3n.

SIO3n is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input makes SIO3n undefined.

**Caution** Do not access SIO3n during a transfer operation unless the access is triggered by a transfer start (read operation is disabled when  $\text{MODEn} = 0$  and write operation is disabled when  $\text{MODEn} = 1$ ).

**Remark** n = 0 or 1

### 14.3 Registers Controlling Serial Interfaces SIO30 and SIO31

Serial interface SIO3n is controlled by the following three registers.

- Serial operation mode register 3n (CSIM3n)
- Port mode registers 2, 3 (PM2, PM3)
- Ports 2, 3 (P2, P3)

#### (1) Serial operation mode register 3n (CSIM3n)

This register is used to enable or disable SIO3n's serial clock, operation modes, and specific operations.

CSIM3n is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears CSIM3n to 00H.

**Remark** n = 0 or 1

**Figure 14-2. Format of Serial Operation Mode Register 30 (CSIM30)**

Address: FFB0H After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0

	Operation mode	Transfer start trigger	SO30/P21 pin function
0	Transmit/transmit and receive mode	Write to SIO30	SO30
1	Receive-only mode	Read from SIO30	P21 <sup>Note 3</sup>

SCL301	SCL300	Clock selection
		0
0	1	$f_x/2^3$ (1.50 MHz)
1	0	$f_x/2^4$ (750 kHz)
1	1	$f_x/2^5$ (375 kHz)

- ★ **Notes** 1. When CSIE30 = 0 (SIO30 operation stopped status), the SI30, SO30, and  $\overline{SCK30}$  pins can be used as port functions.
- 2. When CSIE30 = 1 (SIO30 operation enabled status), the SI30 pin can be used as a port pin if only the transmit function is used, and the SO30 pin can be used as a port pin if only the receive-only mode is used.
- ★ 3. When MODE0 = 1 (receive-only mode), the SO30 pin can be used for port functions.

★ **Caution** Do not rewrite the value of CSIM30 during transfer. However, CSIE30 can be rewritten using a 1-bit memory manipulation instruction.

- Remarks** 1.  $f_x$ : Main system clock oscillation frequency  
 2. Figures in parentheses are for operation with  $f_x = 12$  MHz.

**Figure 14-3. Format of Serial Operation Mode Register 31 (CSIM31)**

Address: FFB8H After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0

MODE1	Transfer operation modes and flags		
	Operation mode	Transfer start trigger	SO31/P35 pin function
0	Transmit/transmit and receive mode	Write to SIO31	SO31
1	Receive-only mode	Read from SIO31	P35 <sup>Note 3</sup>

★	SCL311	SCL310	Clock selection
	0	0	External clock input to $\overline{SCK31}$
	0	1	$f_x/2^3$ (1.50 MHz)
	1	0	$f_x/2^4$ (750 kHz)
	1	1	$f_x/2^5$ (375 kHz)

- ★ **Notes** 1. When CSIE31 = 0 (SIO31 operation stopped status), the SI31, SO31, and  $\overline{SCK31}$  pins can be used as port functions.
- 2. When CSIE31 = 1 (SIO31 operation enabled status), the SI31 pin can be used as a port pin if only the transmit function is used, and the SO31 pin can be used as a port pin if only the receive-only mode is used.
- ★ 3. When MODE1 = 1 (receive-only mode), the SO31 pin can be used for port functions.

★ **Caution** Do not rewrite the value of CSIM31 during transfer. However, CSIE31 can be rewritten using a 1-bit memory manipulation instruction.

- Remarks** 1.  $f_x$ : Main system clock oscillation frequency  
 2. Figures in parentheses are for operation with  $f_x = 12$  MHz.

★ (2) Port mode registers 2, 3 (PM2, PM3)

These registers set the input/output of ports 2 and 3 in 1-bit units.

To use the P21/SO30 and P35/SO31 pins as serial data output, and the P22/ $\overline{\text{SCK30}}$  and P36/ $\overline{\text{SCK31}}$  pins as clock output, clear PM21, PM35, PM22, PM36, and the output latches of P21, P35, P22, and P36 to 0.

To use the P20/SI30 and P34/SI31 pins as serial data input, and the P22/ $\overline{\text{SCK30}}$  and P36/ $\overline{\text{SCK31}}$  pins as clock input, set PM20, PM34, PM22, and PM36 to 1.

At this time, the output latches of P20, P34, P22, and P36 can be either 0 or 1.

PM2 and PM3 are set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets PM2 and PM3 to FFH.

Figure 14-4. Format of Port Mode Register 2 (PM2)

Symbol	7	6	5	4	3	2	1	0
PM3	1	PM36	PM35	PM34	$\downarrow$ Note	$\downarrow$ Note	$\downarrow$ Note	$\downarrow$ Note

PM3n	I/O mode selection of P3n pin (n = 4 to 6)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

**Note** The lower 4 bits (PM 33 to PM30) of PM3 are not fixed to 1. When setting the value using an 8-bit memory manipulation instruction, therefore, be sure to set the lower 4 bits to 1.

## 14.4 Operations of Serial Interfaces SIO30 and SIO31

This section explains the two modes of serial interface SIO3n.

### 14.4.1 Operation stop mode

Because the serial transfer is not performed during this mode, the power consumption can be reduced. In addition, pins can be used as normal I/O ports.

#### (1) Register settings

Operation stop mode is set by serial operation mode register 3n (CSIM3n).

CSIM3n is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears CSIM3n to 00H.

Address: FFB0H (SIO30), FFB8H (SIO31) After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0
CSIM3n	CSIE3n	0	0	0	0	MODEn	SCL3n1	SCL3n0

CSIE3n	Enable/disable specification for SIO3n		
	Shift register operation	Serial counter	Port
0	Operation disabled	Clear	Port function <sup>Note</sup>

**Note** When CSIE3n = 0 (SIO3n operation stop status), the pins SI3n, SO3n, and  $\overline{\text{SCK3n}}$  can be used for port functions.

**Remark** n = 0 or 1

### 14.4.2 3-wire serial I/O mode

The 3-wire serial I/O mode can be used when connecting a peripheral IC incorporating a clocked serial interface, a display controller, etc.

This mode executes data transfers via three lines: a serial clock line ( $\overline{\text{SCK3n}}$ ), serial output line (SO3n), and serial input line (SI3n).

#### (1) Registers to be used

- Serial operation mode register 3n (CSIM3n)
- Port mode registers 2, 3 (PM2, PM3)
- Ports 2, 3 (P2, P3)

#### (a) Serial operation mode register 3n (CSIM3n)

CSIM3n is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears CSIM3n to 00H.

Address: FFB0H (SIO30), FFB8H (SIO31) After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0
CSIM3n	CSIE3n	0	0	0	0	MODEn	SCL3n1	SCL3n0

CSIE3n	Enable/disable specification for SIO3n		
	Shift register operation	Serial counter	Port
0	Operation stopped	Clear	Port function <sup>Note 1</sup>
1	Operation enabled	Count operation enable	Serial function + port function <sup>Note 2</sup>

MODEn	Transfer operation modes and flags		
	Operation mode	Transfer start trigger	SO3n pin function
0	Transmit/transmit and receive mode	Write to SIO3n	SO3n
1	Receive-only mode	Read from SIO3n	Port function <sup>Note 3</sup>

SCL3n1	SCL3n0	Clock selection
0	0	External clock input to $\overline{\text{SCK3n}}$
0	1	$f_x/2^3$ (1.50 MHz)
1	0	$f_x/2^4$ (750 kHz)
1	1	$f_x/2^5$ (375 kHz)

- ★ **Notes**
1. When CSIE3n = 0 (SIO3n operation stopped status), the SI3n, SO3n, and  $\overline{\text{SCK3n}}$  pins can be used as port functions.
  2. When CSIE3n = 1 (SIO3n operation enabled status), the SI3n pin can be used as a port pin if only the transmit function is used, and the SO3n pin can be used as a port pin if only the receive-only mode is used.
  3. When MODEn = 1 (receive-only mode), the SO3n pin can be used for port functions.

★ **Caution** Do not rewrite the value of CSIM3n during transfer. However, CSIE3n can be rewritten using a 1-bit memory manipulation instruction.

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. Figures in parentheses are for operation with  $f_x = 12$  MHz.
  3.  $n = 0$  or  $1$

★ **(b) Port mode registers 2, 3 (PM2, PM3)**

These registers set the input/output of ports 2 and 3 in 1-bit units.

To use the P21/SO30 and P35/SO31 pins as serial data output, and the P22/SCK30 and P36/SCK31 pins as clock output, clear PM21, PM35, PM22, PM36, and the output latches of P21, P35, P22, and P36 to 0.

To use the P20/SI30 and P34/SI31 pins as serial data input, and the P22/SCK30 and P36/SCK31 pins as clock input, set PM20, PM34, PM22, and PM36 to 1.

At this time, the output latches of P20, P34, P22, and P36 can be either 0 or 1.

PM2 and PM3 are set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets PM2 and PM3 to FFH.

Address: FF22H After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0
PM2	1	1	PM25	PM24	PM23	PM22	PM21	PM20

PM2n	P2n pin I/O mode selection (n = 0 to 5)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

Address: FF23H After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0
PM3	1	PM36	PM35	PM34	1Note	1Note	1Note	1Note

PM3n	P3n pin I/O mode selection (n = 4 to 6)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

**Note** The lower 4 bits (PM 33 to PM30) of PM3 are not fixed to 1. When setting the value using an 8-bit memory manipulation instruction, therefore, be sure to set the lower 4 bits to 1.

**(2) Transfer start**

A serial transfer starts when the following two conditions have been satisfied and transfer data has been set (or read) to serial I/O shift register 3n (SIO3n).

<Transfer start conditions>

- SIO3n operation control bit (CSIE3n) = 1
- After an 8-bit serial transfer, either the internal serial clock is stopped or  $\overline{\text{SCK3n}}$  is set to high level.

<Transfer start timing>

- Transmit/transmit and receive mode (MODEn = 0)  
Transfer starts when writing to SIO3n.
- Receive-only mode (MODEn = 1)  
Transfer starts when reading from SIO3n.

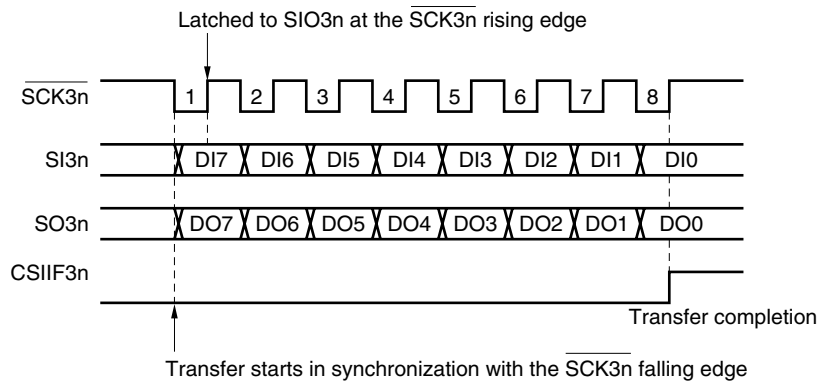

**Caution** After data has been written to SIO3n, transfer will not start even if the CSIE3n bit value is set to 1.

**(3) Communication operations**

In the 3-wire serial I/O mode, data is transmitted and received in 8-bit units. Each bit of data is transmitted or received in synchronization with the serial clock.

Serial I/O shift register 3n (SIO3n) is shifted in synchronization with the falling edge of the serial clock. Transmit data is held in the SO3n latch and is output from the SO3n pin. Data that is received via the SI3n pin in synchronization with the rising edge of the serial clock is latched to SIO3n.

**Figure 14-6. Timing of 3-Wire Serial I/O Mode**

**(4) Transfer complete**

Completion of an 8-bit transfer automatically stops the serial transfer operation and the interrupt request flag (CSIF3n) is set.

**Remark** n = 0 or 1

**Note** When using for transmission only, it can be used as P20 or P34.

**Remark** ×: Don't care, CSIM30, CSIM31: Serial operation mode registers 30, 31, PM××: Port mode register, P××: Output latch of port

## CHAPTER 15 INTERRUPT FUNCTIONS

### 15.1 Interrupt Function Types

The following three types of interrupt functions are used.

#### (1) Non-maskable interrupt

This interrupt is acknowledged even in an interrupt disabled state. It does not undergo priority control and is given top priority over all other interrupt requests. The other interrupt requests are held pending while the nonmaskable interrupt is serviced.

The non-maskable interrupt generates a standby release signal and releases the HALT mode during main system clock operation.

The non-maskable interrupt has only interrupt request from the watchdog timer.

#### (2) Maskable interrupts

These interrupts undergo mask control. Maskable interrupts can be divided into a high interrupt priority group and a low interrupt priority group by setting the priority specification flag registers (PR0L, PR0H, PR1L).

Multiple high priority interrupts can be applied to low priority interrupts. If two or more interrupts with the same priority are simultaneously generated, each interrupt has a predetermined priority (see **Table 15-1**).

The maskable interrupt generates a standby release signal and releases the STOP and HALT modes.

Five external interrupt requests and 13 internal interrupt requests are incorporated as maskable interrupts.

#### (3) Software interrupt

This is a vectored interrupt to be generated by executing the BRK instruction. It is acknowledged even in an interrupt disabled state. The software interrupt does not undergo interrupt priority control.

### 15.2 Interrupt Sources and Configuration

A total of 20 interrupt sources exist among non-maskable, maskable, and software interrupts (see **Table 15-1**).

**Remark** A non-maskable interrupt or a maskable interrupt (internal) can be selected as the watchdog timer interrupt (INTWDT).

Table 15-1. Interrupt Source List

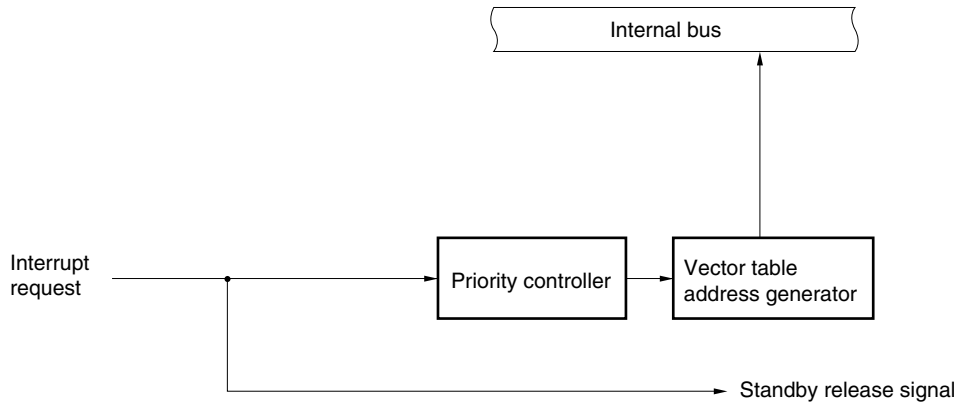

Interrupt Type	Default Priority <sup>Note 1</sup>	Interrupt Source		Internal/External	Vector Table Address	Basic Configuration Type <sup>Note 2</sup>		
		Name	Trigger					
Non-maskable	—	INTWDT	Watchdog timer overflow (with watchdog timer mode 1 selected)	Internal	0004H	(A)		
Maskable	0	INTWDT	Watchdog timer overflow (with interval timer mode selected)			External	0006H 0008H 000AH 000CH	(B)
	1	INTP0	Pin input edge detection	Internal	000EH 0010H 0012H 0014H 0016H 001AH 001CH 001EH 0020H 0022H 0024H 0026H			(B)
	2	INTP1						
	3	INTP2						
	4	INTP3						
	5	INTSER0	Serial interface UART0 reception error generation					
	6	INTSR0	End of serial interface UART0 reception					
	7	INTST0	End of serial interface UART0 transmission					
	8	INTCSI30	End of serial interface SIO30 transfer					
	9	INTCSI31	End of serial interface SIO31 transfer					
	10	INTWTI	Reference time interval signal from watch timer					
	11	INTTM00	Match between TM0 and CR00 (when CR00 is specified as compare register) Detection of TI01 valid edge (when CR00 is specified as capture register)					
	12	INTTM01	Match between TM0 and CR01 (when CR01 is specified as compare register) Detection of TI00 valid edge (when CR01 is specified as capture register)					
	13	INTTM50	Match between TM50 and CR50					
	14	INTTM51	Match between TM51 and CR51					
	15	INTAD0	End of A/D converter conversion					
	16	INTWT	Watch timer overflow					
17	INTKR	Port 4 falling edge detection	External	0028H	(D)			
Software	—	BRK	BRK instruction execution	—	003EH	(E)		

**Notes** 1. The default priority is the priority applicable when two or more maskable interrupts are generated simultaneously. 0 is the highest priority, and 17 is the lowest.

2. Basic configuration types (A) to (E) correspond to (A) to (E) in Figure 15-1.

Figure 15-1. Basic Configuration of Interrupt Function (1/2)

★ (E) Software interrupt

- IF: Interrupt request flag
- IE: Interrupt enable flag
- ISP: In-service priority flag
- MK: Interrupt mask flag
- PR: Priority specification flag
- MEM: Memory expansion mode register

### 15.3 Registers Controlling Interrupt Function

The following seven types of registers are used to control the interrupt functions.

- Interrupt request flag registers (IF0L, IF0H, IF1L)
- Interrupt mask flag registers (MK0L, MK0H, MK1L)
- Priority specification flag registers (PR0L, PR0H, PR1L)
- External interrupt rising edge enable register (EGP)
- External interrupt falling edge enable register (EGN)
- Memory expansion mode register (MEM)
- Program status word (PSW)

Table 15-2 gives a list of interrupt request flags, interrupt mask flags, and priority specification flags corresponding to interrupt request sources.

**Table 15-2. Flags Corresponding to Interrupt Request Sources**

Interrupt Source	Interrupt Request Flag		Interrupt Mask Flag		Priority Specification Flag	
		Register		Register		Register
INTWDT	WDTIF <sup>Note</sup>	IF0L	WDTMK	MK0L	WDTPR	PR0L
INTP0	PIF0		PMK0		PPR0	
INTP1	PIF1		PMK1		PPR1	
INTP2	PIF2		PMK2		PPR2	
INTP3	PIF3		PMK3		PPR3	
INTSER0	SERIF0		SERMK0		SERPR0	
INTSR0	SRIF0		SRMK0		SRPR0	
INTST0	STIF0		STMK0		STPR0	
INTCSI30	CSIF30	IF0H	CSIMK30	MK0H	CSIPR30	PR0H

INTWT	WTIF		WTMK		WTIPR	
INTKR	KRIF		KRMK		KRPR	

**Note** Interrupt control flag when watchdog timer is used as interval timer

**(1) Interrupt request flag registers (IF0L, IF0H, IF1L)**

The interrupt request flags are set to 1 when the corresponding interrupt request is generated or an instruction is executed. They are cleared to 0 when an instruction is executed upon acknowledgment of an interrupt request or upon application of  $\overline{\text{RESET}}$  input.

IF0L, IF0H, and IF1L are set by a 1-bit or 8-bit memory manipulation instruction. When IF0L and IF0H are combined to form 16-bit register IF0, they are set by a 16-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input clears these registers to 00H.

**Figure 15-2. Format of Interrupt Request Flag Register (IF0L, IF0H, IF1L)**

Address: FFE0H After reset: 00H R/W

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>
IF0L	STIF0	SRIF0	SERIF0	PIF3	PIF2	PIF1	PIF0	WDTIF

Address: FFE1H After reset: 00H R/W

Symbol	<7>	<6>	<5>	<4>	<3>	2	<1>	<0>
IF0H	TMIF51	TMIF50	TMIF01	TMIF00	WTIIF	0	CSIF31	CSIF30

Address: FFE2H After reset: 00H R/W

Symbol	7	6	5	4	3	<2>	<1>	<0>
IF1L	0	0	0	0	0	KRIF	WTIF	ADIF0

XXIFX	Interrupt request flag
0	No interrupt request signal is generated
1	Interrupt request signal is generated, interrupt request status

- Cautions**
- 1. The WDTIF flag is R/W enabled only when the watchdog timer is used as the interval timer. If watchdog timer mode 1 is used, set the WDTIF flag to 0.**
  - 2. Be sure to set bit 2 of IF0H and bits 3 to 7 of IF1L to 0.**
  - 3. When operating a timer, serial interface, or A/D converter after standby release, run it once after clearing an interrupt request flag. An interrupt request flag may be set by noise.**
  - 4. When an interrupt is acknowledged, the interrupt request flag is automatically cleared, and then processing of the interrupt routine is started.**
  - 5. When the interrupt request flag register is being manipulated (including 1-bit memory manipulation), if an interrupt request corresponding to other flags in the same register is generated, the flag corresponding to the interrupt request may not be set (1).**

★

**(2) Interrupt mask flag registers (MK0L, MK0H, MK1L)**

The interrupt mask flags are used to enable/disable the corresponding maskable interrupt service. MK0L, MK0H, and MK1L are set by a 1-bit or 8-bit memory manipulation instruction. When MK0L and MK0H are combined to form a 16-bit register MK0, they are set by a 16-bit memory manipulation instruction. RESET input sets these registers to FFH.

**Figure 15-3. Format of Interrupt Mask Flag Register (MK0L, MK0H, MK1L)**

Address: FFE4H After reset: FFH R/W

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>
MK0L	STMK0	SRMK0	SERMK0	PMK3	PMK2	PMK1	PMK0	WDTMK

Address: FFE5H After reset: FFH R/W

Symbol	<7>	<6>	<5>	<4>	<3>	2	<1>	<0>
MK0H	TMMK51	TMMK50	TMMK01	TMMK00	WTIMK	1	CSIMK31	CSIMK30

Address: FFE6H After reset: FFH R/W

Symbol	7	6	5	4	3	<2>	<1>	<0>
MK1L	1	1	1	1	1	KRMK	WTMK	ADMK0

XXMKX	Interrupt servicing control
0	Interrupt servicing enabled
1	Interrupt servicing disabled

- Cautions**
1. If the watchdog timer is used in watchdog timer mode 1, the contents of the WDTMK flag become undefined when read.
  2. Because port 0 pins have an alternate function as external interrupt request input, when the output level is changed by specifying the output mode of the port function, an interrupt request flag is set. Therefore, 1 should be set in the interrupt mask flag before using the output mode.
  3. Be sure to set bit 2 of MK0H and bits 3 to 7 of MK1L to 1.

**(3) Priority specification flag registers (PR0L, PR0H, PR1L)**

The priority specification flags are used to set the corresponding maskable interrupt priority orders. PR0L, PR0H, and PR1L are set by a 1-bit or 8-bit memory manipulation instruction. If PR0L and PR0H are combined to form 16-bit register PR0, they are set by a 16-bit memory manipulation instruction. RESET input sets these registers to FFH.

**Figure 15-4. Format of Priority Specification Flag Register (PR0L, PR0H, PR1L)**

Address: FFE8H After reset: FFH R/W

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>
PR0L	STPR0	SRPR0	SERPR0	PPR3	PPR2	PPR1	PPR0	WDTPR

PR0H	TMPR51	TMPR50	TMPR01	TMPR00	WTIPR	1	CSIPR31	CSIPR30

Address: FFEAH After reset: FFH R/W

Symbol	7	6	5	4	3	<2>	<1>	<0>
PR1L	1	1	1	1	1	KRPR	WTPR	ADPR0

XXPRX	Priority level selection
0	High priority level
1	Low priority level

- Cautions**
1. When the watchdog timer is used in the watchdog timer mode 1, set 1 in the WDTPR flag.
  2. Be sure to set bit 2 of PR0H and bits 3 to 7 of PR1L to 1.

**(4) External interrupt rising edge enable register (EGP), external interrupt falling edge enable register (EGN)**

These registers specify the valid edge for INTP0 to INTP3.

EGP and EGN are set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears these registers to 00H.

**Figure 15-5. Format of External Interrupt Rising Edge Enable Register (EGP) and External Interrupt Falling Edge Enable Register (EGN)**

Address: FF48H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
EGP	0	0	0	0	EGP3	EGP2	EGP1	EGP0

Address: FF49H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
EGN	0	0	0	0	EGN3	EGN2	EGN1	EGN0

EGPn	EGNn	INTPn pin valid edge selection (n = 0 to 3)
0	0	Interrupt disabled
0	1	Falling edge
1	0	Rising edge
1	1	Both rising and falling edges

★ **Caution** When the function is switched from external interrupt request to port, edge detection may be performed. Therefore, clear EGPn and EGNn to 0 before switching to the port mode.

**(5) Memory expansion mode register (MEM)**

MEM sets the rising edge detection function of port 4.

MEM is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears MEM to 00H.

**Figure 15-6. Format of Memory Expansion Mode Register (MEM)**

Address: FF47H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
MEM	0	0	0	0	0	MM2	MM1	MM0

MM2	MM1	MM0	Single-chip/memory expansion mode selection
0	0	0	Single-chip mode
0	0	1	Port 4 falling edge detection mode
Other than above			Setting prohibited

**Caution** When using the falling edge detection function of port 4, be sure to set MEM to 01H.

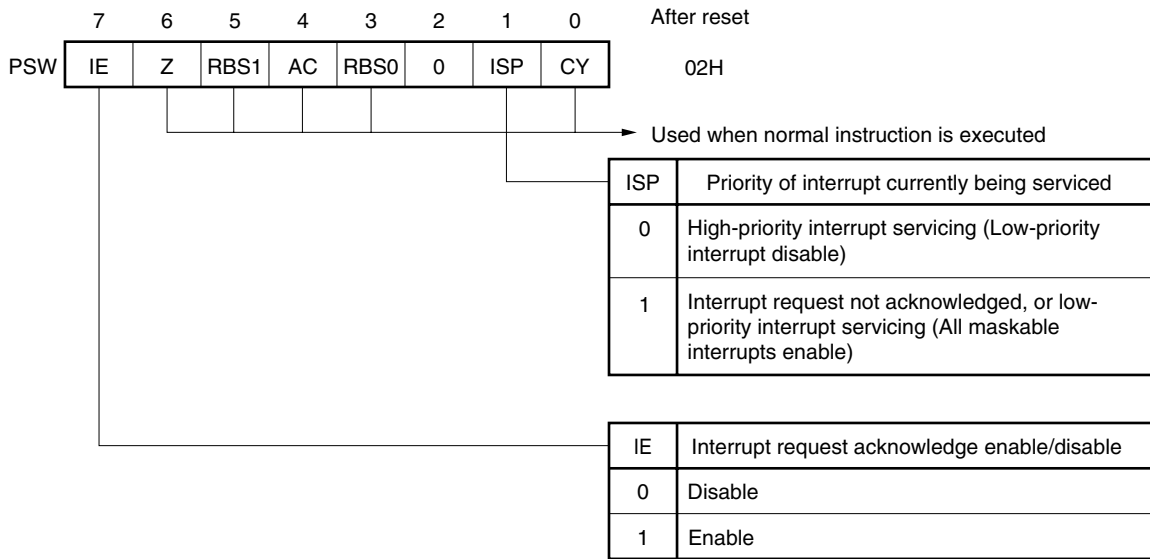

**(6) Program status word (PSW)**

The program status word is a register to hold the instruction execution result and the current status for an interrupt request. The IE flag to set maskable interrupt enable/disable and the ISP flag to control nesting processing are mapped.

Besides 8-bit read/write, this register can carry out operations with a bit manipulation instruction and dedicated instructions (EI and DI). When a vectored interrupt request is acknowledged, if the BRK instruction is executed, the contents of PSW are automatically saved into a stack and the IE flag is reset to 0. If a maskable interrupt request is acknowledged, the contents of the priority specification flag of the acknowledged interrupt are transferred to the ISP flag. The PSW contents are also saved into the stack with the PUSH PSW instruction. They are reset from the stack with the RETI, RETB, and POP PSW instructions.

RESET input sets PSW to 02H.

**Figure 15-7. Format of Program Status Word**

## 15.4 Interrupt Servicing Operations

### 15.4.1 Non-maskable interrupt request acknowledge operation

A non-maskable interrupt request is unconditionally acknowledged even if in an interrupt acknowledge disable state. It does not undergo interrupt priority control and has highest priority over all other interrupts.

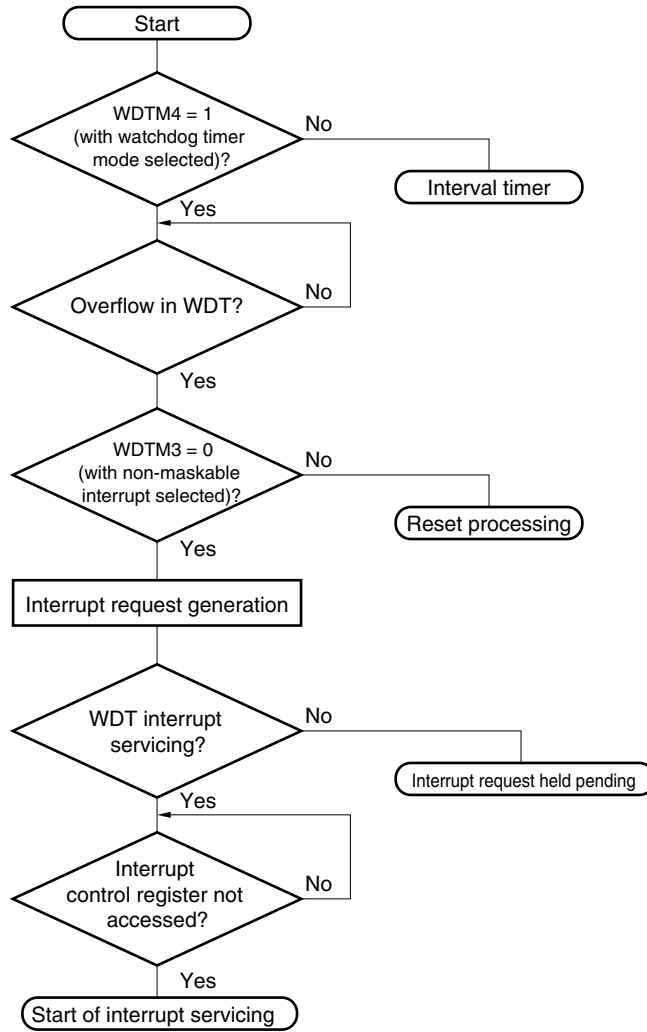

If a non-maskable interrupt request is acknowledged, the contents are saved into the stacks in the order of PSW, then PC, the IE flag and ISP flag are reset (0), and the contents of the vector table are loaded into PC and branched.

★ At this time, the NMIS flag is set (1) to disable acknowledgment of multiple interrupts.

A new non-maskable interrupt request generated during execution of a non-maskable interrupt servicing program is acknowledged after the current execution of the non-maskable interrupt servicing program is terminated (following RETI instruction execution) and one main routine instruction is executed. However, if a new non-maskable interrupt request is generated twice or more during non-maskable interrupt servicing program execution, only one non-maskable interrupt request is acknowledged after termination of the non-maskable interrupt servicing program execution. Figures 15-8, 15-9, and 15-10 show the flowchart of the non-maskable interrupt request generation through acknowledge, acknowledge timing of non-maskable interrupt request, and acknowledge operation at multiple non-maskable interrupt request generation, respectively.

★ **Remark** When a non-maskable interrupt is acknowledged, the NMIS flag is set (1). It is cleared (0) by the RET or RETI instruction. When a non-maskable interrupt is generated, execute the RETI instruction to restore processing from the interrupt.

Figure 15-8. Non-Maskable Interrupt Request Generation to Acknowledge Flowchart

WDTM: Watchdog timer mode register  
 WDT: Watchdog timer

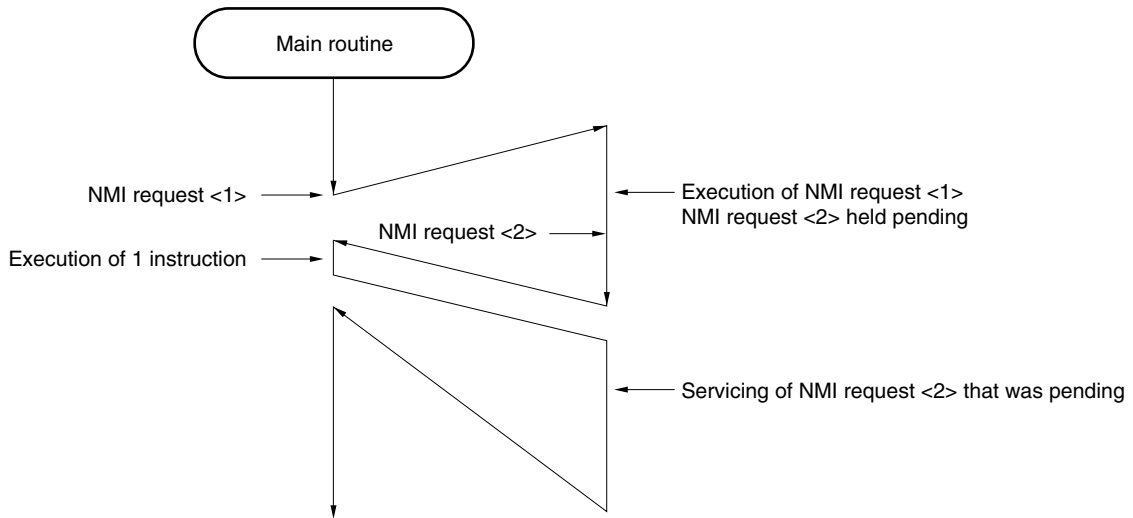

Figure 15-9. Non-Maskable Interrupt Request Acknowledge Timing

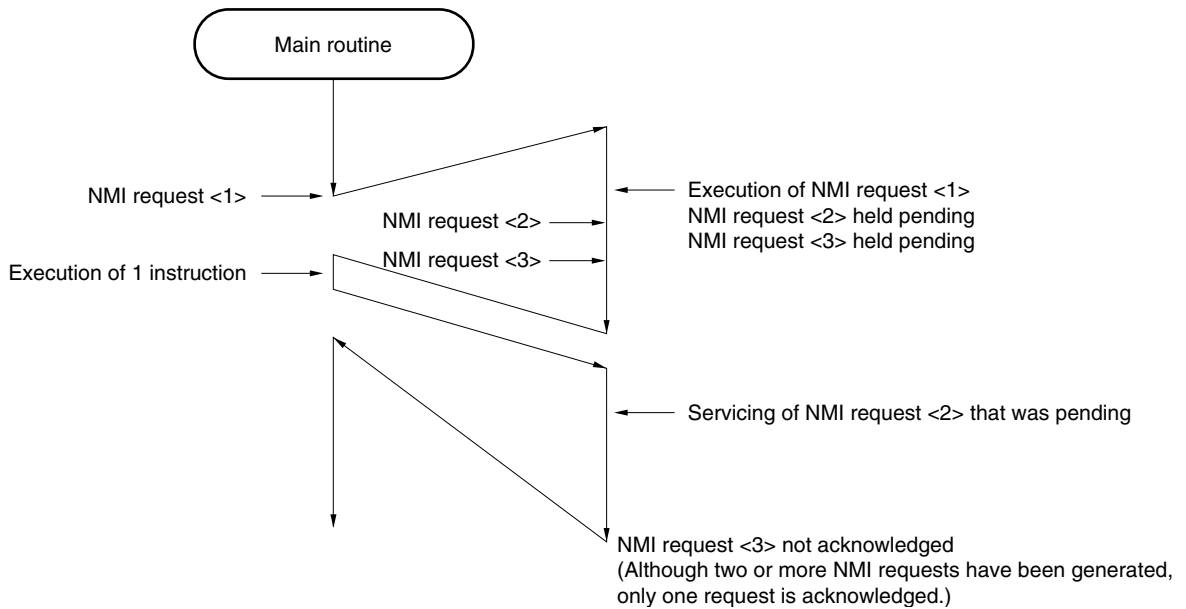

WDTIF: Watchdog timer interrupt request flag

Figure 15-10. Non-Maskable Interrupt Request Acknowledge Operation

(a) If a non-maskable interrupt request is generated during non-maskable interrupt servicing program execution

(b) If two non-maskable interrupt requests are generated during non-maskable interrupt servicing program execution

**15.4.2 Maskable interrupt request acknowledge operation**

A maskable interrupt request becomes acknowledgeable when an interrupt request flag is set to 1 and the mask (MK) flag corresponding to that interrupt request is cleared to 0. A vectored interrupt request is acknowledged if in the interrupt enable state (when IE flag is set to 1). However, a low-priority interrupt request is not acknowledged during servicing of a higher priority interrupt request (when the ISP flag is reset to 0).

★ Moreover, even if the EI instruction is executed during execution of a non-maskable interrupt servicing program (NMIS = 1), neither non-maskable interrupt requests nor maskable interrupt requests are acknowledged.

The times from generation of a maskable interrupt request until interrupt servicing is performed are listed in Table 15-3 below.

For the interrupt request acknowledge timing, see **Figures 15-12** and **15-13**.

**Table 15-3. Times from Generation of Maskable Interrupt Until Servicing**

	Minimum Time	Maximum Time <sup>Note</sup>
When $\times\times PR = 0$	7 clocks	32 clocks
When $\times\times PR = 1$	8 clocks	33 clocks

**Note** If an interrupt request is generated just before a divide instruction, the wait time becomes longer.

**Remark** 1 clock:  $1/f_{CPU}$  ( $f_{CPU}$ : CPU clock)

If two or more maskable interrupt requests are generated simultaneously, the request with a higher priority level specified in the priority specification flag is acknowledged first. If two or more maskable interrupt requests have the same priority level, the request with the highest default priority is acknowledged first.

An interrupt request that is held pending is acknowledged when it becomes acknowledgeable.

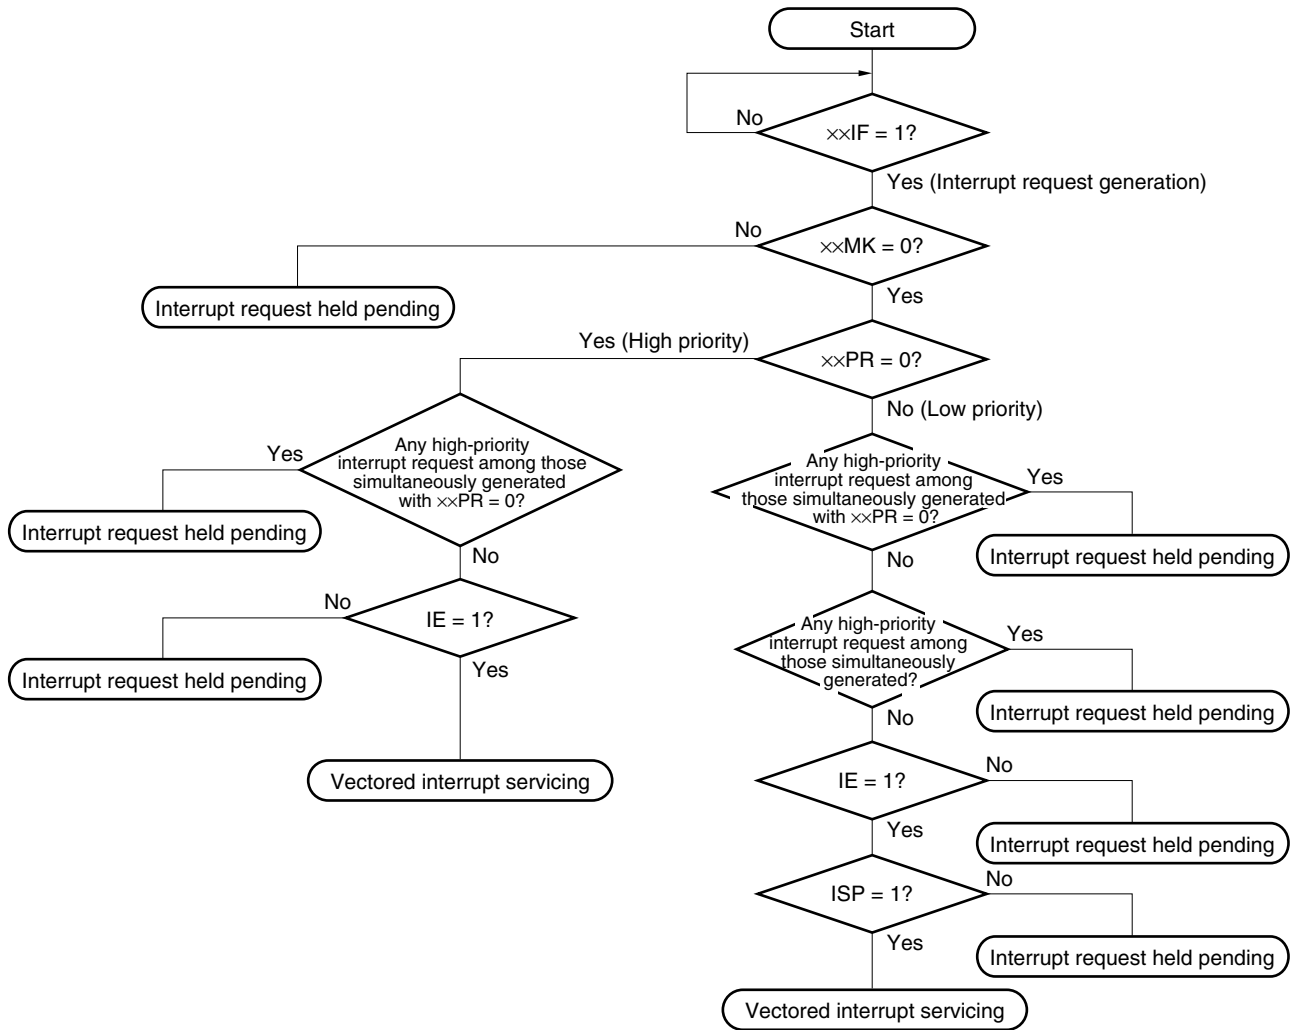

Figure 15-11 shows the interrupt request acknowledge algorithm.

If a maskable interrupt request is acknowledged, the contents are saved into the stacks in the order of PSW, then PC, the IE flag is reset (0), and the contents of the priority specification flag corresponding to the acknowledged interrupt are transferred to the ISP flag. Further, the vector table data determined for each interrupt request is loaded into PC and branched.

Return from an interrupt is possible with the RETI instruction.

Figure 15-11. Interrupt Request Acknowledge Processing Algorithm

xxIF: Interrupt request flag

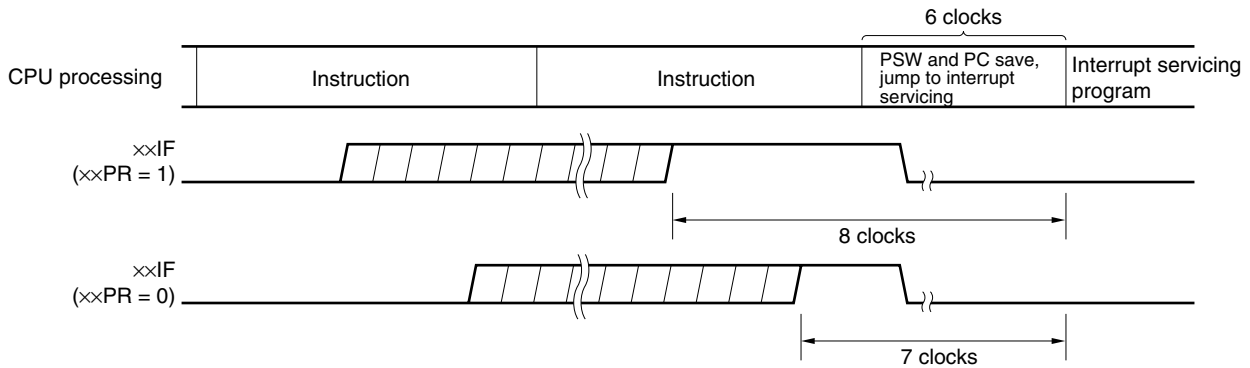

xxMK: Interrupt mask flag

xxPR: Priority specification flag

IE: Flag that controls acknowledge of maskable interrupt request (1 = enable, 0 = disable)

ISP: Flag that indicates the priority level of the interrupt currently being serviced (0 = high-priority interrupt servicing, 1 = no interrupt request acknowledged, or low-priority interrupt servicing)

**Figure 15-12. Interrupt Request Acknowledge Timing (Minimum Time)**

**Remark** 1 clock:  $1/f_{CPU}$  ( $f_{CPU}$ : CPU clock)

**Figure 15-13. Interrupt Request Acknowledge Timing (Maximum Time)**

**Remark** 1 clock:  $1/f_{CPU}$  ( $f_{CPU}$ : CPU clock)

### 15.4.3 Software interrupt request acknowledge operation

A software interrupt request is acknowledged by BRK instruction execution. Software interrupts cannot be disabled.

If a software interrupt request is acknowledged, the contents are saved into the stacks in the order of the program status word (PSW), then program counter (PC), the IE flag is reset (0), and the contents of the vector table (003EH, 003FH) are loaded into PC and branched.

Return from a software interrupt is possible with the RETB instruction.

**Caution** Do not use the RETI instruction for returning from the software interrupt.

**15.4.4 Multiple interrupt servicing**

Multiple interrupt servicing occurs when an interrupt request is acknowledged during execution of another interrupt.

Multiple interrupt servicing does not occur unless the interrupt request acknowledge enable state is selected (IE = 1) (except non-maskable interrupts). Also, when an interrupt request is acknowledged, interrupt request acknowledge becomes disabled (IE = 0). Therefore, to enable nesting, it is necessary to set (1) the IE flag with the EI instruction during interrupt servicing to enable interrupt acknowledge.

Moreover, even if interrupts are enabled, multiple interrupt servicing may not be enabled, this being subject to interrupt priority control. Two types of priority control are available: default priority control and programmable priority control. Programmable priority control is used for nesting.

In the interrupt enable state, if an interrupt request with a priority equal to or higher than that of the interrupt currently being serviced is generated, it is acknowledged for multiple interrupt servicing. If an interrupt with a priority lower than that of the interrupt currently being serviced is generated during interrupt servicing, it is not acknowledged for multiple interrupt servicing.

Interrupt requests that are not enabled because of the interrupt disable state or they have a lower priority are held pending. When servicing of the current interrupt ends, the pending interrupt request is acknowledged following execution of at least one main processing instruction execution.

Multiple interrupt servicing is not possible during non-maskable interrupt servicing.

Table 15-4 shows interrupt requests enabled for multiple interrupt servicing and Figure 15-14 shows multiple interrupt servicing examples.

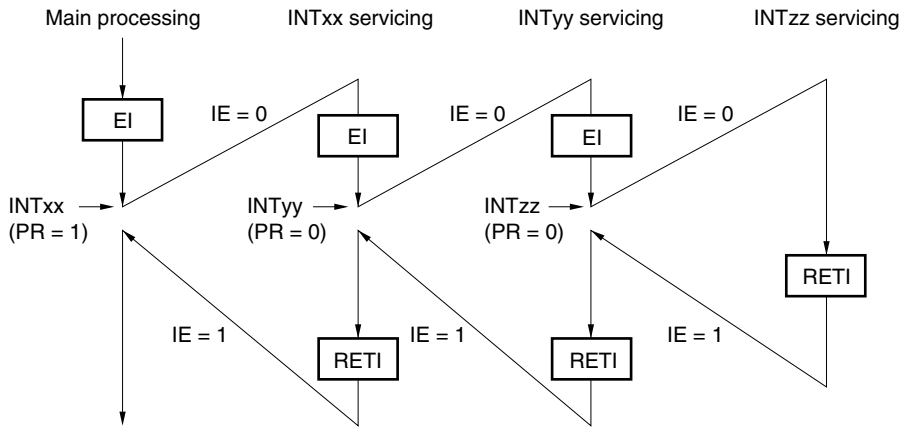

★ **Table 15-4. Interrupt Requests Enabled for Multiple Interrupt During Interrupt Servicing**

Request for Multiple Interrupts Interrupt Being Serviced		Non-Maskable Interrupt Request	Maskable Interrupt Request				Software Interrupt Request
			PR = 0		PR = 1		
			IE = 1	IE = 0	IE = 1	IE = 0	
Non-maskable interrupt		×	×	×	×	×	○
Maskable interrupt	ISP = 0	○	○	×	×	×	○
	ISP = 1	○	○	×	○	×	○
Software interrupt		○	○	×	○	×	○

- Remarks**
- : Nesting enabled
  - ×: Multiple interrupt servicing disabled
  - ISP and IE are flags contained in PSW.  
 ISP = 0: An interrupt with higher priority is being serviced.  
 ISP = 1: No interrupt request has been acknowledged, or an interrupt with a lower priority is being serviced.
  - IE = 0: Interrupt request acknowledge is disabled.  
 IE = 1: Interrupt request acknowledge is enabled.
  - PR is a flag contained in PR0L, PR0H, and PR1L.  
 PR = 0: Higher priority level  
 PR = 1: Lower priority level

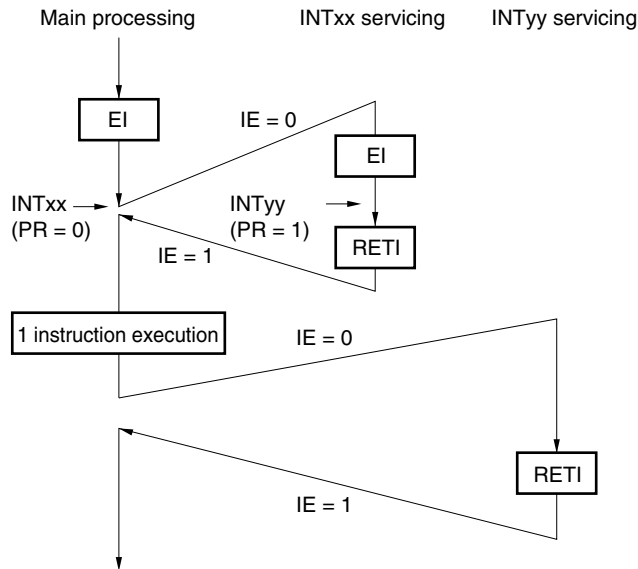

Figure 15-14. Examples of Multiple Interrupt Servicing (1/2)

**Example 1. Multiple interrupt servicing occurs twice**

During servicing of interrupt INTxx, two interrupt requests, INTyy and INTzz, are acknowledged, and multiple interrupt servicing takes place. Before each interrupt request is acknowledged, the EI instruction must always be issued to enable interrupt request acknowledgment.

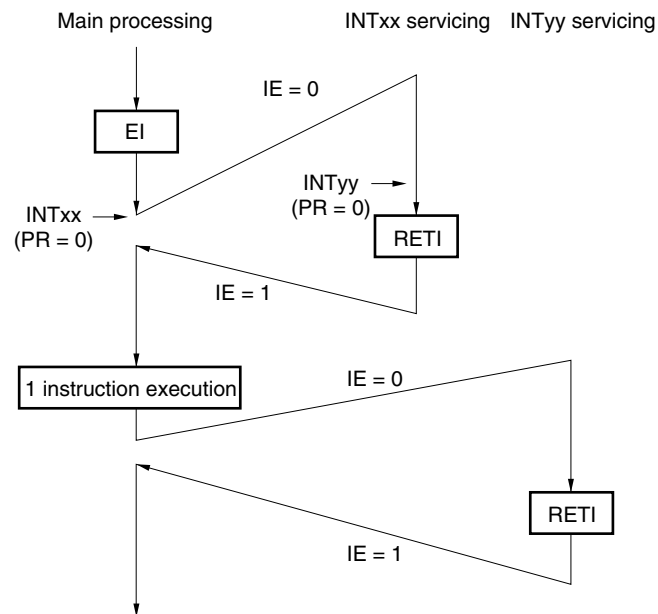

**Example 2. Nesting does not occur due to priority control**

Interrupt request INTyy issued during servicing of interrupt INTxx is not acknowledged because its priority is lower than that of INTxx, and multiple interrupt servicing does not take place. The INTyy interrupt request is held pending, and is acknowledged following execution of one main processing instruction.

- PR = 0: Higher priority level
- PR = 1: Lower priority level
- IE = 0: Interrupt request acknowledgment disabled

Figure 15-14. Examples of Multiple Interrupt Servicing (2/2)

**Example 3. Multiple interrupt servicing does not occur because interrupts are not enabled**

Interrupts are not enabled during servicing of interrupt INTxx (EI instruction is not issued), so interrupt request INTyy is not acknowledged and multiple interrupt servicing does not take place. The INTyy interrupt request is held pending, and is acknowledged following execution of one main processing instruction.

PR = 0: Higher priority level

IE = 0: Interrupt request acknowledgment disabled

**15.4.5 Interrupt request hold**

There are instructions where, even if an interrupt request is issued for them while another instruction is executed, request acknowledge is held pending until the end of execution of the next instruction. These instructions (interrupt request hold instructions) are listed below.

- MOV PSW, #byte
- MOV A, PSW
- MOV PSW, A
- MOV1 PSW. bit, CY
- MOV1 CY, PSW. bit
- AND1 CY, PSW. bit
- OR1 CY, PSW. bit
- XOR1 CY, PSW. bit
- SET1 PSW. bit
- CLR1 PSW. bit
- RETB
- RETI
- PUSH PSW
- POP PSW
- BT PSW. bit, \$addr16
- BF PSW. bit, \$addr16
- BTCLR PSW. bit, \$addr16
- EI
- DI
- Manipulation instructions for the IF0L, IF0H, IF1L, MK0L, MK0H, MK1L, PR0L, PR0H, and PR1L registers

**Caution** The BRK instruction is not one of the above-listed interrupt request hold instructions. However, the software interrupt activated by executing the BRK instruction causes the IE flag to be cleared to 0. Therefore, even if a maskable interrupt request is generated during execution of the BRK instruction, the interrupt request is not acknowledged. However, a non-maskable interrupt request is acknowledged.

Figure 15-15 shows the timing with which interrupt requests are held pending.

**Figure 15-15. Interrupt Request Hold**

- Remarks**
1. Instruction N: Interrupt request hold instruction
  2. Instruction M: Instruction other than interrupt request hold instruction
  3. The xPR (priority level) values do not affect the operation of xIF (interrupt request).

## CHAPTER 16 STANDBY FUNCTION

### 16.1 Standby Function and Configuration

#### 16.1.1 Standby function

The standby function is designed to decrease power consumption of the system. The following two modes are available.

##### (1) HALT mode

HALT instruction execution sets the HALT mode. The HALT mode is intended to stop the CPU operation clock. The system clock oscillator continues oscillating. In this mode, power consumption is not decreased as much as in the STOP mode. However, the HALT mode is effective to restart operation immediately upon interrupt request and to carry out intermittent operations.

##### (2) STOP mode

STOP instruction execution sets the STOP mode. In the STOP mode, the main system clock oscillator stops, stopping the whole system, thereby considerably reducing the CPU power consumption.

Data memory low-voltage hold (down to  $V_{DD} = 1.6\text{ V}$ ) is possible. Thus, the STOP mode is effective to hold data memory contents with ultra-low power consumption.

Because this mode can be cleared upon interrupt request, it enables intermittent operations to be carried out. However, because a wait time is required to secure an oscillation stabilization time after the STOP mode is cleared, select the HALT mode if it is necessary to start processing immediately upon interrupt request.

In either of these two modes, all the contents of registers, flags and data memory just before the standby mode is set are held. The I/O port output latch and output buffer statuses are also held.

- Cautions**
- 1. The STOP mode can be used only when the system operates with the main system clock (subsystem clock oscillation cannot be stopped). The HALT mode can be used with either the main system clock or the subsystem clock.**
  - 2. When operation is transferred to the STOP mode, be sure to stop the peripheral hardware operating with the main system clock before executing the STOP instruction.**
  - 3. The following sequence is recommended for power consumption reduction of the A/D converter when the standby function is used: First clear bit 7 (ADCS0) of the A/D converter mode register 0 (ADM0) to 0 to stop the A/D conversion operation, and then execute the HALT or STOP instruction.**

**16.1.2 Standby function control register**

The wait time after the STOP mode is released upon an interrupt request is controlled by the oscillation stabilization time select register (OSTS).

OSTS is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets the value of OSTS to 04H. Therefore, when the STOP mode is released by inputting  $\overline{\text{RESET}}$ , it takes  $2^{17}/f_x$  until release.

**Figure 16-1. Format of Oscillation Stabilization Time Select Register (OSTS)**

Address: FFFAH After reset: 04H R/W

Symbol	7	6	5	4	3	2	1	0
OSTS	0	0	0	0	0	OSTS2	OSTS1	OSTS0

★

OSTS2	OSTS1	OSTS0	Selection of oscillation stabilization time
0	0	0	$2^{12}/f_x$ (341 $\mu\text{s}$ )
0	0	1	$2^{14}/f_x$ (1.36 ms)
0	1	0	$2^{15}/f_x$ (2.73 ms)
0	1	1	$2^{16}/f_x$ (5.46 ms)
1	0	0	$2^{17}/f_x$ (10.9 ms)
Other than above			Setting prohibited

**Caution** The wait time after the STOP mode is released does not include the time (see “a” in the illustration below) from STOP mode release to clock oscillation start. This applies regardless of whether STOP mode is released by  $\overline{\text{RESET}}$  input or by interrupt request generation.

- Remarks**
1.  $f_x$ : Main system clock oscillation frequency
  2. Figures in parentheses are for operation with  $f_x = 12$  MHz.

## 16.2 Operations of Standby Function

### 16.2.1 HALT mode

#### (1) HALT mode setting and operating status

The HALT mode is set by executing the HALT instruction. It can be set with the main system clock or the subsystem clock.

The operating status in the HALT mode is described below.

**Table 16-1. HALT Mode Operating Status**

Item	During HALT Instruction Execution Using Main System Clock		During HALT Instruction Execution Using Subsystem Clock	
	Without Subsystem Clock <sup>Note 1</sup>	With Subsystem Clock <sup>Note 2</sup>	With Main System Clock Oscillation	With Main System Clock Oscillation Stopped
Clock generator	Both main system clock and subsystem clock can be oscillated. Clock supply to CPU stops.			
CPU	Operation stops.			
Port (output latch)	Status before HALT mode setting is held.			
16-bit timer/event counter 0	Operable			Operation stops.
8-bit timer/event counters 50, 51	Operable			Operable when TI50, TI51 are selected as count clock.
Watch timer	Operable when $f_x/2^7$ is selected as count clock	Operable		Operable when $f_{XT}$ is selected as count clock.
Watchdog timer	Operable		Operation stops.	
★ Clock output	Operable when $f_x$ to $f_x/2^7$ is selected as output clock	Operable		Operable when $f_{XT}$ is selected as count clock.
★ Buzzer output	Operable			BUZ is at low level.
A/D converter	Operation stops.			
Serial interface	Operable			Operable during external clock input
External interrupt	Operable			

**Notes** 1. Including case when external clock is not supplied.

2. Including case when external clock is supplied.

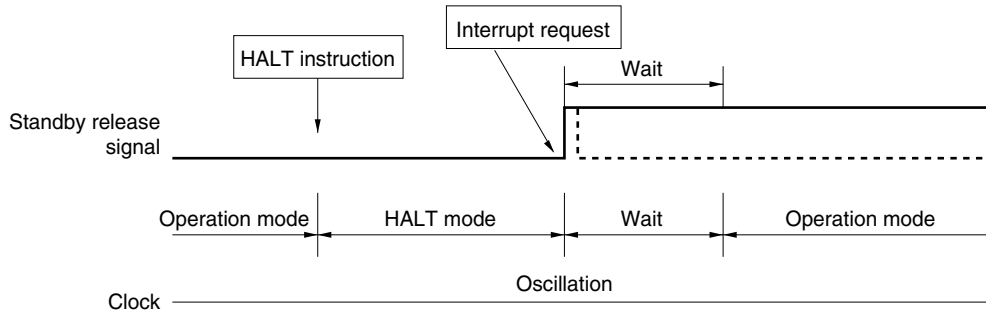

**(2) HALT mode release**

The HALT mode can be released with the following three types of sources.

**(a) Release by unmasked interrupt request**

When an unmasked interrupt request is generated, the HALT mode is released. If interrupt acknowledge is enabled, vectored interrupt service is carried out. If interrupt acknowledge is disabled, the next address instruction is executed.

**Figure 16-2. HALT Mode Release by Interrupt Request Generation**

**Remarks 1.** The broken line indicates the case when the interrupt request which has released the standby mode is acknowledged.

**2.** Wait times are as follows:

- When vectored interrupt service is carried out: 8 or 9 clocks
- When vectored interrupt service is not carried out: 2 or 3 clocks

**(b) Release by non-maskable interrupt request**

When a non-maskable interrupt request is generated, the HALT mode is released and vectored interrupt service is carried out whether interrupt acknowledge is enabled or disabled.

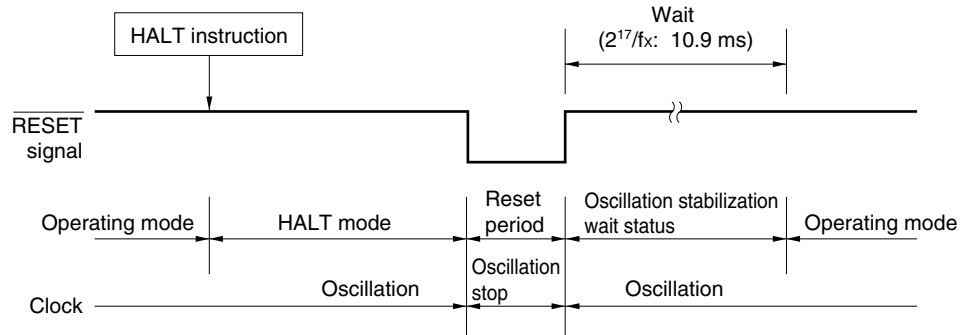

★

However, a non-maskable interrupt request is not generated during subsystem clock operation.

(c) Release by  $\overline{\text{RESET}}$  input

When  $\overline{\text{RESET}}$  signal is input, HALT mode is released. And, as in the case with normal reset operation, a program is executed after branch to the reset vector address.

Figure 16-3. HALT Mode Release by  $\overline{\text{RESET}}$  Input

- Remarks 1. fx: Main system clock oscillation frequency
- 2. Values in parentheses are for operation with fx = 12 MHz.

Table 16-2. Operation After HALT Mode Release

Release Source	MKxx	PRxx	IE	ISP	Operation
Maskable interrupt request	0	0	0	×	Next address instruction execution
	0	0	1	×	Interrupt service execution
	0	1	0	1	Next address instruction execution
	0	1	×	0	
	0	1	1	1	Interrupt service execution
	1	×	×	×	HALT mode hold
Non-maskable interrupt request	—	—	×	×	Interrupt service execution
$\overline{\text{RESET}}$ input	—	—	×	×	Reset processing

×: Don't care

16.2.2 STOP mode

(1) STOP mode setting and operating status

The STOP mode is set by executing the STOP instruction. It can be set only with the main system clock.

**Cautions** 1. When the STOP mode is set, the X2 pin is internally connected to V<sub>DD1</sub> via a pull-up resistor to minimize the leakage current at the crystal oscillator. Thus, do not use the STOP mode in a system where an external clock is used for the main system clock.

2. Because the interrupt request signal is used to clear the standby mode, if there is an interrupt source with the interrupt request flag set and the interrupt mask flag reset, the standby mode is immediately cleared if set. Thus, the STOP mode is reset to the HALT mode immediately after execution of the STOP instruction. After the wait set using the oscillation stabilization time select register (OSTS), the operating mode is set.

The operating status in the STOP mode is described below.

Table 16-3. STOP Mode Operating Status

STOP Mode Setting		With Subsystem Clock	Without Subsystem Clock
Item			
Clock generator		Only main system clock oscillation is stopped.	
CPU		Operation stops.	
Port (output latch)		Status before STOP mode setting is held.	
16-bit timer/event counter 0		Operation stops.	
8-bit timer/event counters 50, 51		Operable only when TI50, TI51 are selected as count clock.	
Watch timer		Operable when f <sub>XT</sub> is selected as count clock.	Operation stops.
Watchdog timer		Operation stops.	
★	Clock output	Operable when f <sub>XT</sub> is selected as output clock.	PCL is at low level.
Buzzer output		BUZ is at low level.	
A/D converter		Operation stops.	
Serial interface	Other than UART	Operable only when externally supplied input clock is specified as the serial clock.	
	UART	Operation stops (transmit shift register 0 (TXS0), receive shift register 0 (RX0), and receive buffer register 0 (RXB0) hold the value just before the clock stop).	
External interrupt		Operable	

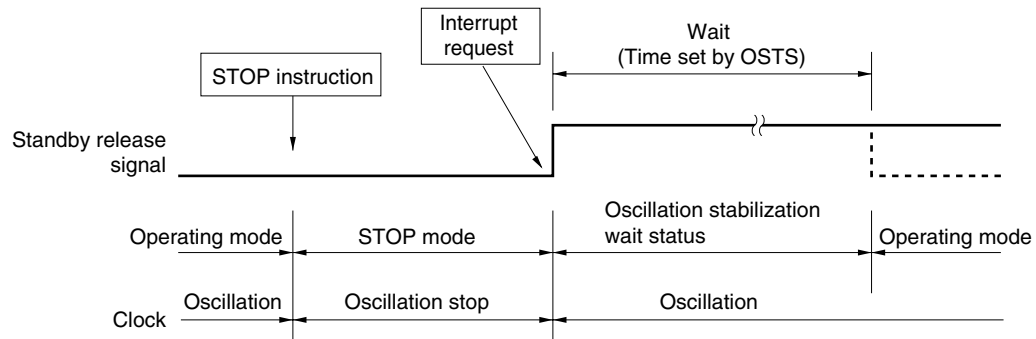

**(2) STOP mode release**

The STOP mode can be released by the following two types of sources.

**(a) Release by unmasked interrupt request**

When an unmasked interrupt request is generated, the STOP mode is released. If interrupt acknowledge is enabled after the lapse of oscillation stabilization time, vectored interrupt service is carried out. If interrupt acknowledge is disabled, the next address instruction is executed.

**Figure 16-4. STOP Mode Release by Interrupt Request Generation**

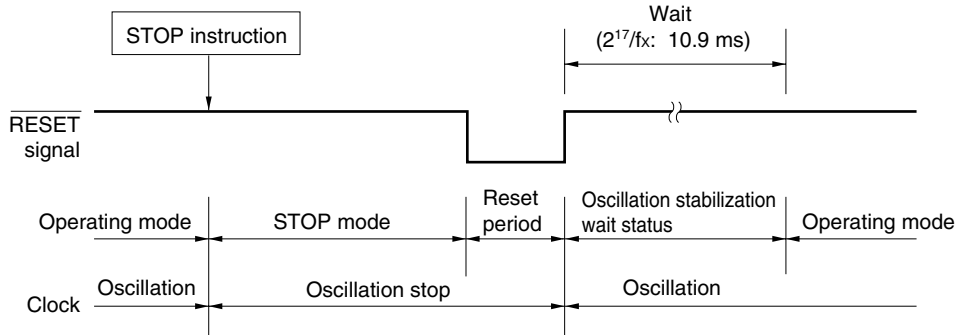

**Remark** The broken line indicates the case when the interrupt request which has released the standby mode is acknowledged.

**(b) Release by  $\overline{\text{RESET}}$  input**

The STOP mode is released when  $\overline{\text{RESET}}$  signal is input, and after the lapse of oscillation stabilization time, reset operation is carried out.

**Figure 16-5. STOP Mode Release by  $\overline{\text{RESET}}$  Input**

- Remarks 1.** fx: Main system clock oscillation frequency
- 2.** Values in parentheses are for operation with fx = 12 MHz.

**Table 16-4. Operation After STOP Mode Release**

Release Source	MKxx	PRxx	IE	ISP	Operation
Maskable interrupt request	0	0	0	×	Next address instruction execution
	0	0	1	×	Interrupt service execution
	0	1	0	1	Next address instruction execution
	0	1	×	0	
	0	1	1	1	Interrupt service execution
	1	×	×	×	STOP mode hold
$\overline{\text{RESET}}$ input	—	—	×	×	Reset processing

×: Don't care

## CHAPTER 17 RESET FUNCTION

The following two operations are available to generate the reset signal.

- (1) External reset input via  $\overline{\text{RESET}}$  pin
- (2) Internal reset by watchdog timer program loop time detection

External reset and internal reset have no functional differences. In both cases, program execution starts at the address at 0000H and 0001H by  $\overline{\text{RESET}}$  input.

When a low level is input to the  $\overline{\text{RESET}}$  pin or the watchdog timer overflows, a reset is applied and each hardware is set to the status shown in Table 17-1. Each pin has high impedance during reset input or during oscillation stabilization time just after reset clear.

When a high level is input to the  $\overline{\text{RESET}}$  pin, the reset is cleared and program execution starts after the lapse of oscillation stabilization time ( $2^{17}/f_x$ ). The reset applied by watchdog timer overflow is automatically cleared after a reset and program execution starts after the lapse of oscillation stabilization time ( $2^{17}/f_x$ ) (see **Figures 17-2 to 17-4**).

- Cautions**
1. For an external reset, input a low level for 10  $\mu\text{s}$  or more to the  $\overline{\text{RESET}}$  pin.
  2. During reset input, main system clock oscillation remains stopped but subsystem clock oscillation continues.
  3. When the STOP mode is cleared by reset, the STOP mode contents are held during reset input. However, the port pin becomes high-impedance.

Figure 17-1. Block Diagram of Reset Function

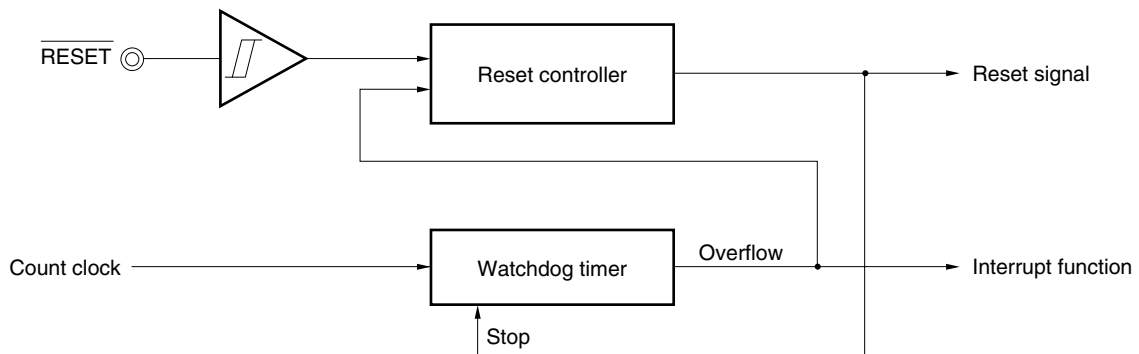

Figure 17-2. Timing of Reset by  $\overline{\text{RESET}}$  Input

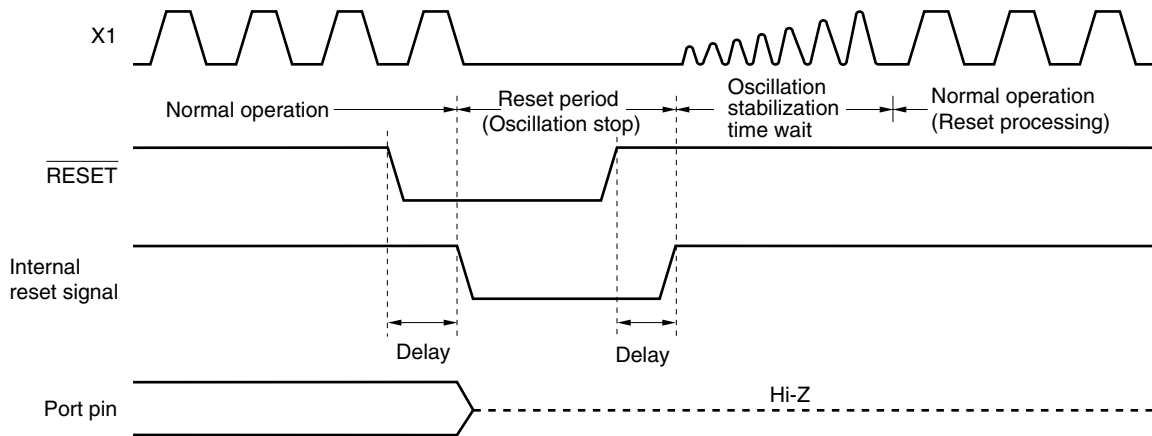

Figure 17-3. Timing of Reset Due to Watchdog Timer Overflow

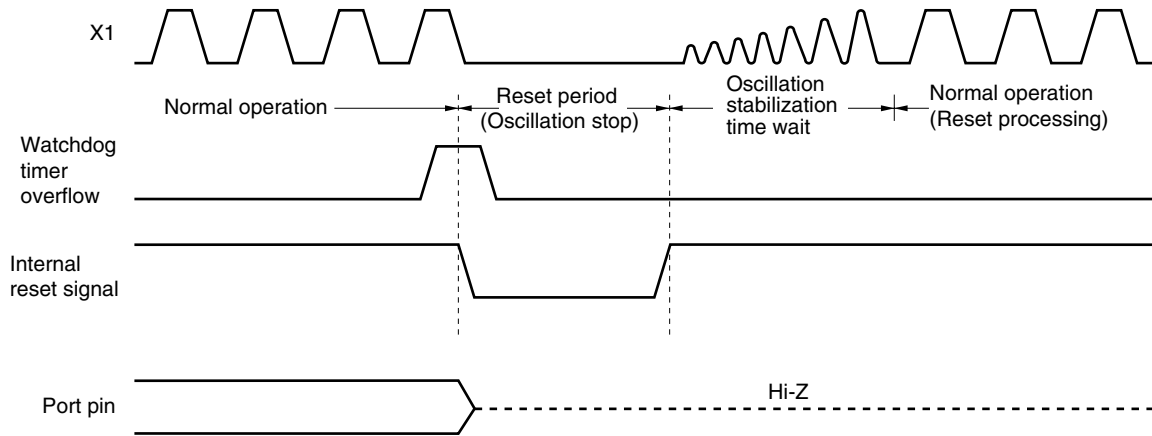

Figure 17-4. Timing of Reset in STOP Mode by  $\overline{\text{RESET}}$  Input

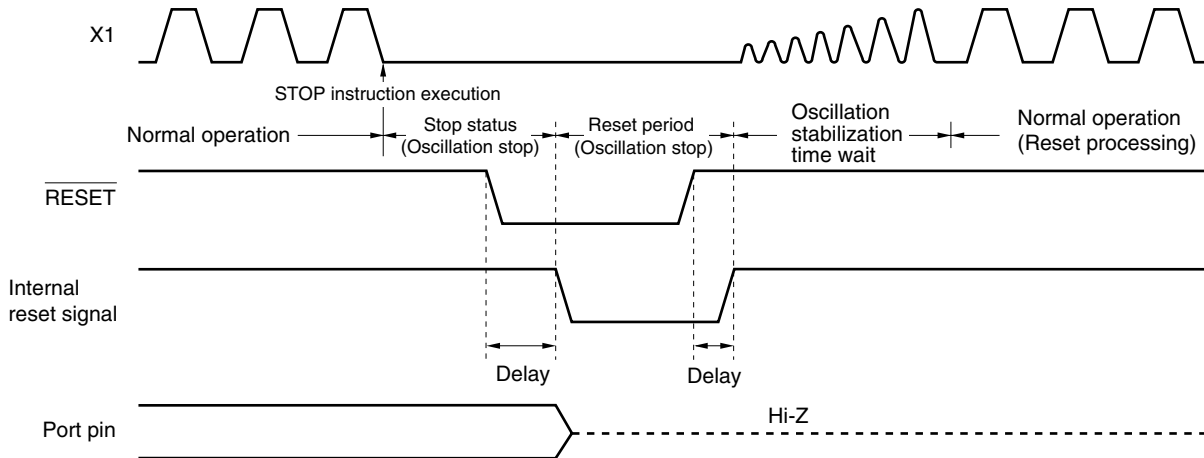

Table 17-1. Hardware Statuses After Reset (1/2)

Hardware		Status After Reset
Program counter (PC) <sup>Note 1</sup>		Contents of reset vector table (0000H, 0001H) are set.
Stack pointer (SP)		Undefined
Program status word (PSW)		02H
RAM	Data memory	Undefined <sup>Note 2</sup>
	General-purpose register	Undefined <sup>Note 2</sup>
Port (output latch)		00H
Port mode registers 0, 2 to 5, 7 (PM0, PM2 to PM5, PM7)		FFH
Pull-up resistor option registers 0, 2 to 5, 7 (PU0, PU2 to PU5, PU7)		00H
Processor clock control register (PCC)		04H
Memory size switching register (IMS)		CFH <sup>Note 3</sup>
Memory expansion mode register (MEM)		00H
Oscillation stabilization time select register (OSTS)		04H
16-bit timer/event counter	Timer counter 0 (TM0)	0000H
	Capture/compare registers 00, 01 (CR00, CR01)	Undefined
	Prescaler mode register 0 (PRM0)	00H
	Capture/compare control register 0 (CRC0)	00H
	Mode control register 0 (TMC0)	00H
	Output control register 0 (TOC0)	00H
8-bit timer/event counter	Timer counters 50, 51 (TM50, TM51)	00H
	Compare registers 50, 51 (CR50, CR51)	Undefined
	Clock select registers 50, 51 (TCL50, TCL51)	00H
	Mode control registers 50, 51 (TMC50, TMC51)	00H
Watch timer	Operation mode register (WTM)	00H
Watchdog timer	Clock select register (WDCS)	00H
	Mode register (WDTM)	00H

- Notes**
1. During reset input or oscillation stabilization time wait, only the PC contents among the hardware statuses become undefined. All other hardware statuses remain unchanged after reset.
  2. When a reset is executed in the standby mode, the pre-reset status is held even after reset.
  3. Although the initial value is CFH, use the following value to be set for each version.  
 $\mu$ PD780021AS, 780031AS: 42H  
 $\mu$ PD780022AS, 780032AS: 44H  
 $\mu$ PD780023AS, 780033AS: C6H  
 $\mu$ PD780024AS, 780034AS: C8H  
 $\mu$ PD78F0034BS: Value for mask ROM versions

**Table 17-1. Hardware Statuses After Reset (2/2)**

Hardware		Status After Reset
Clock output/buzzer output controller	Clock output select register (CKS)	00H
A/D converter	Conversion result register 0 (ADCR0)	00H
	Mode register 0 (ADM0)	00H
	Analog input channel specification register 0 (ADS0)	00H
Serial interface UART0	Asynchronous serial interface mode register 0 (ASIM0)	00H
	Asynchronous serial interface status register 0 (ASIS0)	00H
	Baud rate generator control register 0 (BRGC0)	00H
	Transmit shift register 0 (TXS0)	FFH
	Receive buffer register 0 (RXB0)	
Serial interfaces SIO30, SIO31	Shift registers 30, 31 (SIO30, SIO31)	Undefined
	Operating mode registers 30, 31 (CSIM30, CSIM31)	00H
Interrupt	Request flag registers (IF0L, IF0H, IF1L)	00H
	Mask flag registers (MK0L, MK0H, MK1L)	FFH
	Priority specification flag registers (PR0L, PR0H, PR1L)	FFH
	External interrupt rising edge enable register (EGP)	00H
	External interrupt falling edge enable register (EGN)	00H

## CHAPTER 18 $\mu$ PD78F0034BS

The  $\mu$ PD78F0034BS is provided as the flash memory version of the  $\mu$ PD780024AS, 780034AS Subseries.

The  $\mu$ PD78F0034BS is a product that incorporates flash memory in which the program can be written, erased, and rewritten while it is mounted on the board.

Writing to flash memory can be performed with the memory mounted on the target system (on board). A dedicated flash programmer is connected to the target system to perform writing.

★

The following can be considered as the development environment and the applications using flash memory.

- Software can be altered after the  $\mu$ PD78F0034BS is solder-mounted on the target system.
- Small scale production of various models is made easier by differentiating software.
- Data adjustment in starting mass production is made easier.

Table 18-1 shows the differences between the  $\mu$ PD78F0034BS and the mask ROM versions.

**Table 18-1. Differences Among  $\mu$ PD78F0034BS and Mask ROM Versions**

Item	$\mu$ PD78F0034BS	Mask ROM Versions	
		$\mu$ PD780034AS Subseries	$\mu$ PD780024AS Subseries
Internal ROM configuration	Flash memory	Mask ROM	
Internal ROM capacity	32 KB <sup>Note</sup>	$\mu$ PD780031AS: 8 KB $\mu$ PD780032AS: 16 KB $\mu$ PD780033AS: 24 KB $\mu$ PD780034AS: 32 KB	$\mu$ PD780021AS: 8 KB $\mu$ PD780022AS: 16 KB $\mu$ PD780023AS: 24 KB $\mu$ PD780024AS: 32 KB
Internal high-speed RAM capacity	1024 bytes <sup>Note</sup>	$\mu$ PD780031AS: 512 bytes $\mu$ PD780032AS: 512 bytes $\mu$ PD780033AS: 1024 bytes $\mu$ PD780034AS: 1024 bytes	$\mu$ PD780021AS: 512 bytes $\mu$ PD780022AS: 512 bytes $\mu$ PD780023AS: 1024 bytes $\mu$ PD780024AS: 1024 bytes
Resolution of A/D converter	10 bits		8 bits
IC pin	None	Available	
V <sub>PP</sub> pin	Available	None	
Electrical specifications, recommended soldering conditions	Refer to <b>CHAPTER 20 ELECTRICAL SPECIFICATIONS</b> and <b>CHAPTER 22 RECOMMENDED SOLDERING CONDITIONS</b> .		

**Note** The same capacity as the mask ROM versions can be specified by means of the memory size switching register (IMS).

**Caution** There are differences in noise immunity and noise radiation between the flash memory and mask ROM versions. When pre-producing an application set with the flash memory version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluations for the commercial samples (not engineering samples) of the mask ROM version.

### 18.1 Memory Size Switching Register

The  $\mu$ PD78F0034BS allows users to select the internal memory capacity using the memory size switching register (IMS) so that the same memory map as that of the  $\mu$ PD780021AS, 780022AS, 780023AS, 780024AS and  $\mu$ PD780031AS, 780032AS, 780033AS, 780034AS with a different size of internal memory capacity can be achieved.

IMS is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$  input sets IMS to CFH.

- ★ **Caution** Be sure to set the values of the target mask ROM version as the initial setting of the program. Reset input initializes IMS to CFH. Also be sure to set the values of the target mask ROM version after reset.

**Figure 18-1. Format of Memory Size Switching Register (IMS)**

Address: FFF0H After reset: CFH R/W

Symbol	7	6	5	4	3	2	1	0
IMS	RAM2	RAM1	RAM0	0	ROM3	ROM2	ROM1	ROM0

RAM2	RAM1	RAM0	Internal high-speed RAM capacity selection
0	1	0	512 bytes
1	1	0	1024 bytes
Other than above			Setting prohibited

ROM3	ROM2	ROM1	ROM0	Internal ROM capacity selection
0	0	1	0	8 KB
0	1	0	0	16 KB
0	1	1	0	24 KB
1	0	0	0	32 KB
1	1	1	1	60 KB (setting prohibited)
Other than above				Setting prohibited

The IMS settings to obtain the same memory map as mask ROM versions are shown in Table 18-2.

**Table 18-2. Memory Size Switching Register Settings**

Target Mask ROM Versions	IMS Setting
$\mu$ PD780021AS, 780031AS	42H
$\mu$ PD780022AS, 780032AS	44H
$\mu$ PD780023AS, 780033AS	C6H
$\mu$ PD780024AS, 780034AS	C8H

- Caution** When using the mask ROM versions, be sure to set the value indicated in Table 18-2 to IMS.

## ★ 18.2 Flash Memory Characteristics

Flash memory programming is performed by connecting a dedicated flash programmer (Flashpro III (part no. FL-PR3, PG-FP3)/Flashpro IV (part no. FL-PR4, PG-FP4)) to the target system with the flash memory mounted on the target system (on-board). A flash memory writing adapter (program adapter), which is a target board used exclusively for programming, is also provided.

**Remark** FL-PR3, FL-PR4, and the program adapter are products made by Naito Densai Machida Mfg. Co., Ltd. (TEL +81-45-475-4191).

Programming using flash memory has the following advantages.

- Software can be modified after the microcontroller is solder-mounted on the target system.
- Distinguishing software facilities low-quantity, varied model production
- Easy data adjustment when starting mass production

### 18.2.1 Programming environment

The following shows the environment required for  $\mu$ PD78F0034BS flash memory programming.

When Flashpro III or Flashpro IV is used as a dedicated flash programmer, a host machine is required to control the dedicated flash programmer. Communication between the host machine and flash programmer is performed via RS-232C/USB (Rev. 1.1).

For details, refer to the manuals of Flashpro III/Flashpro IV.

**Remark** USB is supported by Flashpro IV only.

**Figure 18-2. Environment for Writing Program to Flash Memory**

**18.2.2 Communication mode**

Use the communication mode shown in Table 18-3 to perform communication between the dedicated flash programmer and the  $\mu$ PD78F0034BS.

**Table 18-2. Communication Mode List**

Communication Mode	Standard (TYPE) Setting <sup>Note 1</sup>					Pins Used	Number of V <sub>PP</sub> Pulses
	Port (COMM PORT)	Speed (SIO CLOCK)	On Target (CPU CLOCK)	Frequency (Flashpro Clock)	Multiply Rate (Multiple Rate)		
3-wire serial I/O (SIO30)	SIO-ch0 (SIO ch-0)	2.4 kHz to 625 kHz <sup>Note 2</sup> (100 Hz to 1.25 MHz) <sup>Note 2</sup>	Optional	1 to 10 MHz <sup>Note 2</sup>	1.0	S130/P20 SO30/P21 SCK30/P22	0
3-wire serial I/O (SIO31)	SIO-ch1 (SIO ch-1)					S131/P34 SO31/P35 SCK31/P36	1
3-wire serial I/O (SIO30) with handshake	SIO-H/S (SIO ch-3 + handshake)					S130/P20 SO30/P21 SCK30/P22 HS/P25	3
UART (UART0)	UART-ch0 (UART ch-0)	4800 to 76800 Baud <sup>Notes 2, 3</sup> (4800 to 76800 bps) <sup>Notes 2, 3</sup>				RxD0/P23 TxD0/P24	8
Pseudo 3-wire serial I/O	Port-ch0 (Port A)	100 Hz to 1500 Hz <sup>Note 2</sup> (100 Hz to 1.25 MHz) <sup>Note 2</sup>				P70/TI00/TO0 (serial data input) P71/TI01 (serial data output) P72/TI50/TO50 (serial clock input)	12

- Notes**
1. Selection items for Standard settings on Flashpro IV (TYPE settings on Flashpro III).
  2. The possible setting range differs depending on the voltage. For details, refer to **CHAPTER 20 ELECTRICAL SPECIFICATIONS**.
  3. Because factors other than the baud rate error, such as the signal waveform slew, also affect UART communication, thoroughly evaluate the slew as well as the baud rate error.

**Remark** Items enclosed in parentheses in the setting item column are the set value and set item of Flashpro III when they differ from those of Flashpro IV.

**Figure 18-3. Communication Mode Selection Format**

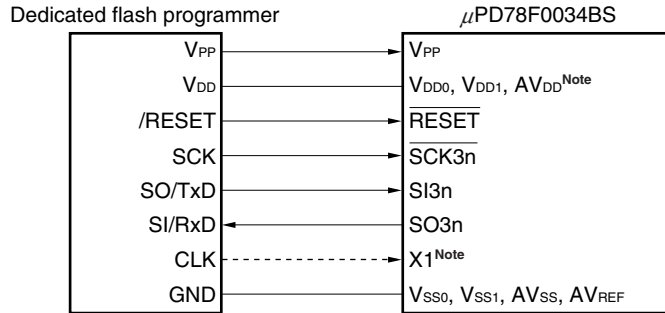

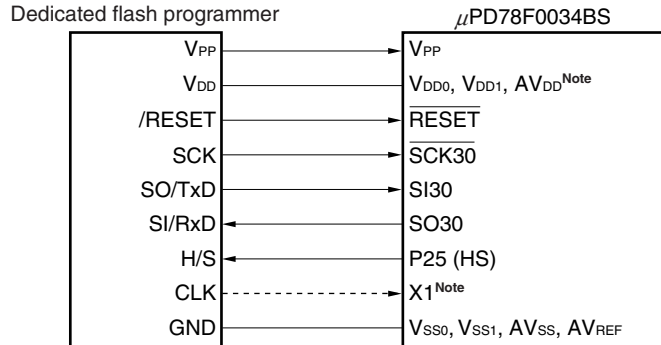

Figure 18-4. Example of Connection with Dedicated Flash Programmer (1/2)

(a) 3-wire serial I/O (SIO3n)

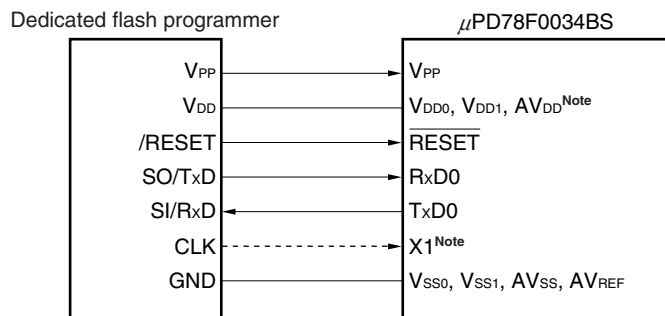

**Remark** n = 0 or 1

(b) 3-wire serial I/O (SIO30) with handshake

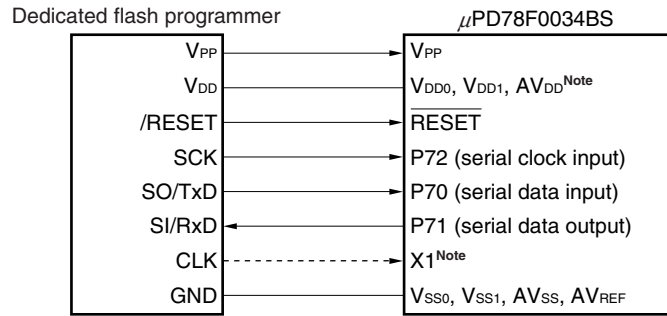

(c) UART (UART0)

**Note** The V<sub>DD0</sub>, V<sub>DD1</sub>, AV<sub>DD</sub>, and X1 pins can be supplied on board. In this case, these pins do not need to be connected to the dedicated flash programmer, but V<sub>DD</sub> voltage must be supplied to these pins (except the X1 pin) before programming is started.

Figure 18-4. Example of Connection with Dedicated Flash Programmer (2/2)

(d) Pseudo 3-wire serial I/O

**Note** The  $V_{DD0}$ ,  $V_{DD1}$ ,  $AV_{DD}$ , and  $X1$  pins can be supplied on board. In this case, these pins do not need to be connected to the dedicated flash programmer, but  $V_{DD}$  voltage must be supplied to these pins (except the  $X1$  pin) before programming is started.

If Flashpro III/Flashpro IV is used as the dedicated flash programmer, the following signals are generated for the  $\mu$ PD78F0034BS. For details, refer to the manual of Flashpro III/Flashpro IV.

Table 18-4. Pin Connection List

Signal Name	I/O	Pin Function	Pin Name	SIO30	SIO31	SIO30 (HS)	UART0	Pseudo 3-Wire
$V_{PP}$	Output	Write voltage	$V_{PP}$	⊙	⊙	⊙	⊙	⊙
$V_{DD}$	I/O	$V_{DD}$ voltage generation/ voltage monitoring	$V_{DD0}$ , $V_{DD1}$ , $AV_{DD}$	Note ⊙	Note ⊙	Note ⊙	Note ⊙	Note ⊙
GND	–	Ground	$V_{SS0}$ , $V_{SS1}$ , $AV_{SS}$ , $AV_{REF}$	⊙	⊙	⊙	⊙	⊙
CLK	Output	Clock output	$X1$	○	○	○	○	○
/RESET	Output	Reset signal	$\overline{RESET}$	⊙	⊙	⊙	⊙	⊙
SI/RxD	Input	Reception signal	SO30/SO31/TxD0/P71	⊙	⊙	⊙	⊙	⊙
SO/TxD	Output	Transmission signal	SI30/SI31/RxD0/P70	⊙	⊙	⊙	⊙	⊙
SCK	Output	Transfer clock	$\overline{SCK30}/\overline{SCK31}/P72$	⊙	⊙	⊙	×	⊙
H/S	Input	Handshake signal	P25 (HS)	×	×	⊙	×	×

**Note**  $V_{DD}$  voltage must be supplied before programming is started.

**Remark** ⊙: Pin must be connected.  
 ○: If the signal is supplied on the target board, pin does not need to be connected.  
 ×: Pin does not need to be connected.

### 18.2.3 On-board pin handling

When performing programming on the target system, provide a connector on the target system to connect the dedicated flash programmer.

An on-board function that allows switching between normal operation mode and flash memory programming mode may be required in some cases.

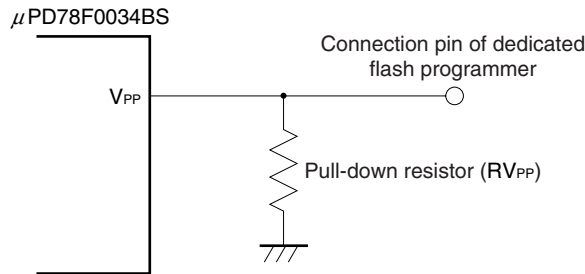

#### <V<sub>PP</sub> pin>

In normal operation mode, input 0 V to the V<sub>PP</sub> pin. In flash memory programming mode, a write voltage of 10.0 V (TYP.) is supplied to the V<sub>PP</sub> pin, so perform the following.

- (1) Connect a pull-down resistor (RV<sub>PP</sub> = 10 k $\Omega$ ) to the V<sub>PP</sub> pin.
- (2) Use the jumper on the board to switch the V<sub>PP</sub> pin input to either the programmer or directly to GND.

A V<sub>PP</sub> pin connection example is shown below.

**Figure 18-5. V<sub>PP</sub> Pin Connection Example**

#### <Serial interface pin>

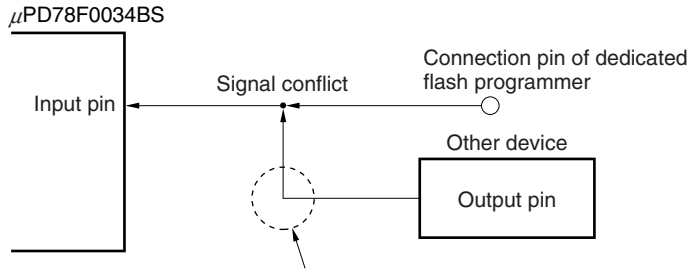

The following shows the pins used by the serial interface.

Serial Interface	Pins Used
3-wire serial I/O (SIO30)	SI30/P20, SO30/P21, $\overline{\text{SCK30}}$ /P22
3-wire serial I/O (SIO31)	SI31/P34, SO31/P35, $\overline{\text{SCK31}}$ /P36
3-wire serial I/O (SIO30) with handshake	SI30/P20, SO30/P21, $\overline{\text{SCK30}}$ /P22, HS/P25
UART (UART0)	RxD0/P23, TxD0/P24
Pseudo 3-wire serial I/O	P70/TI00/TO0 (serial data input), P71/TI01 (serial data output), P72/TI50/TO50 (serial clock input)

When connecting the dedicated flash programmer to a serial interface pin that is connected to another device on-board, signal conflict or abnormal operation of the other device may occur. Care must therefore be taken with such connections.

**(1) Signal conflict**

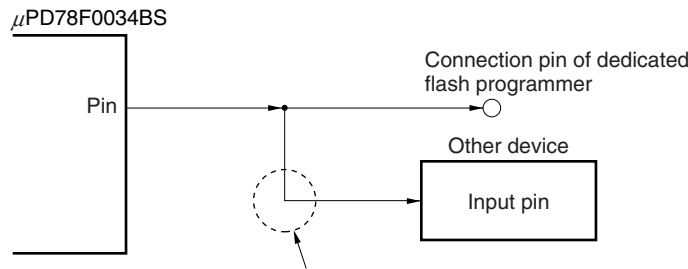

If the dedicated flash programmer (output) is connected to a serial interface pin (input) that is connected to another device (output), a signal conflict occurs. To prevent this, isolate the connection with the other device or set the other device to the output high impedance status.

**Figure 18-6. Signal Conflict (Input Pin of Serial Interface)**

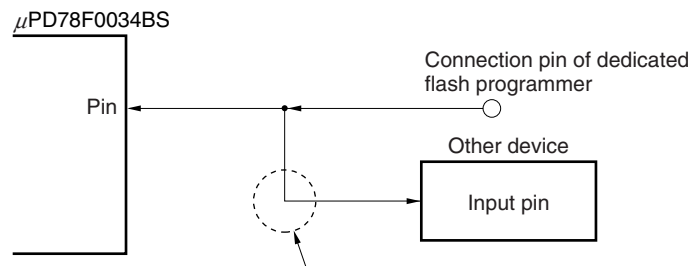

In the flash memory programming mode, the signal output by another device and the signal sent by the dedicated flash programmer conflict, therefore, isolate the signal of the other device.

**(2) Abnormal operation of other device**

If the dedicated flash programmer (output or input) is connected to a serial interface pin (input or output) that is connected to another device (input), a signal is output to the device, which may cause an abnormal operation. To prevent this abnormal operation, isolate the connection with the other device or set so that the input signals to the other device are ignored.

**Figure 18-7. Abnormal Operation of Other Device**

If the signal output by the  $\mu$ PD78F0034BS affects another device in the flash memory programming mode, isolate the signals of the other device.

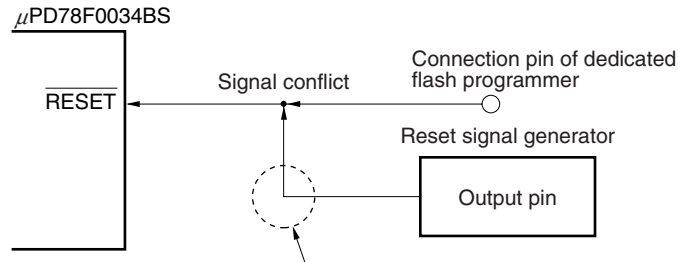

If the signal output by the dedicated flash programmer affects another device in the flash memory programming mode, isolate the signals of the other device.

**<RESET pin>**

If the reset signal of the dedicated flash programmer is connected to the  $\overline{\text{RESET}}$  pin connected to the reset signal generator on-board, a signal conflict occurs. To prevent this, isolate the connection with the reset signal generator.

If the reset signal is input from the user system in the flash memory programming mode, a normal programming operation cannot be performed. Therefore, do not input reset signals from other than the dedicated flash programmer.

**Figure 18-8. Signal Conflict ( $\overline{\text{RESET}}$  Pin)**

The signal output by the reset signal generator and the signal output from the dedicated flash programmer conflict in the flash memory programming mode, so isolate the signal of the reset signal generator.

**<Port pins>**

When the flash memory programming mode is set, all the pins other than those that communicate in flash memory programming are in the same status as immediately after reset.

If the external device does not recognize initial statuses such as the output high impedance status, therefore, connect the external device to  $V_{DD0}$  or  $V_{SS0}$  via a resistor.

**<Oscillator>**

When using the on-board clock, connect X1, X2, XT1, and XT2 as required in the normal operation mode.

When using the clock output of the flash programmer, connect it directly to X1, disconnecting the main oscillator on-board, and leave the X2 pin open. The subsystem clock conforms to the normal operation mode.

**<Power supply>**

To use the power output from the flash programmer, connect the  $V_{DD0}$  and  $V_{DD1}$  pins to  $V_{DD}$  of the flash programmer, and the  $V_{SS0}$  and  $V_{SS1}$  pins to GND of the flash programmer.

To use the on-board power supply, make connections that accord with the normal operation mode. However, because the voltage is monitored by the flash programmer, be sure to connect  $V_{DD}$  of the flash programmer. Supply the same power as in the normal operation mode to the other power supply pins ( $AV_{DD}$ ,  $AV_{REF}$ , and  $AV_{SS}$ ).

18.2.4 Connection of adapter for flash writing

The following figure shows an example of the recommended connection when the adapter for flash writing is used.

Figure 18-9. Wiring Example for Flash Writing Adapter in 3-Wire Serial I/O Mode (1/2)

(a) Example for SIO30

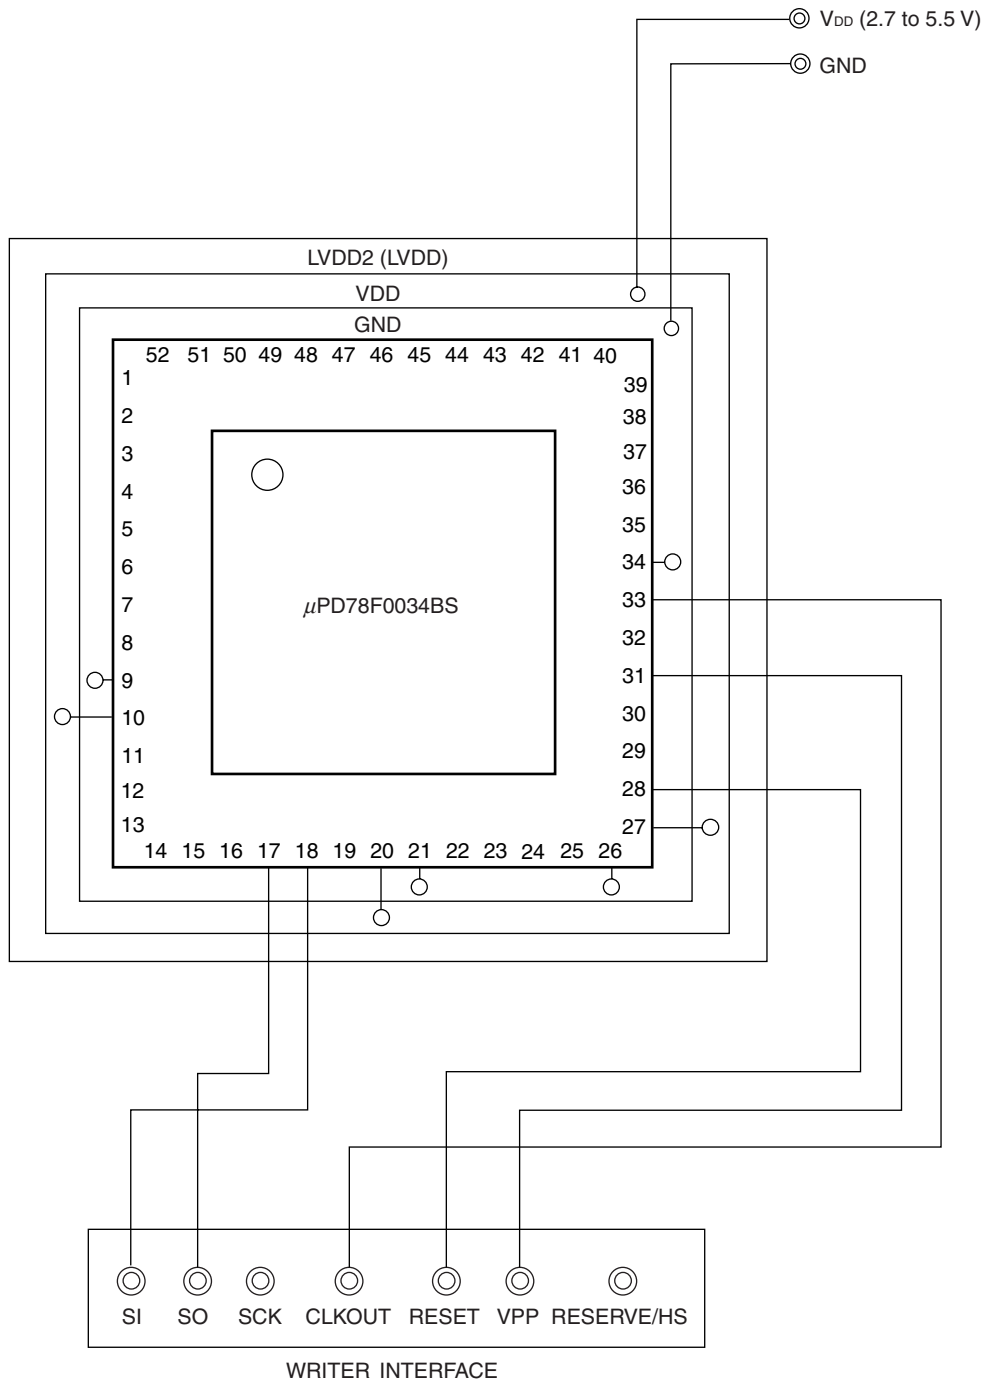

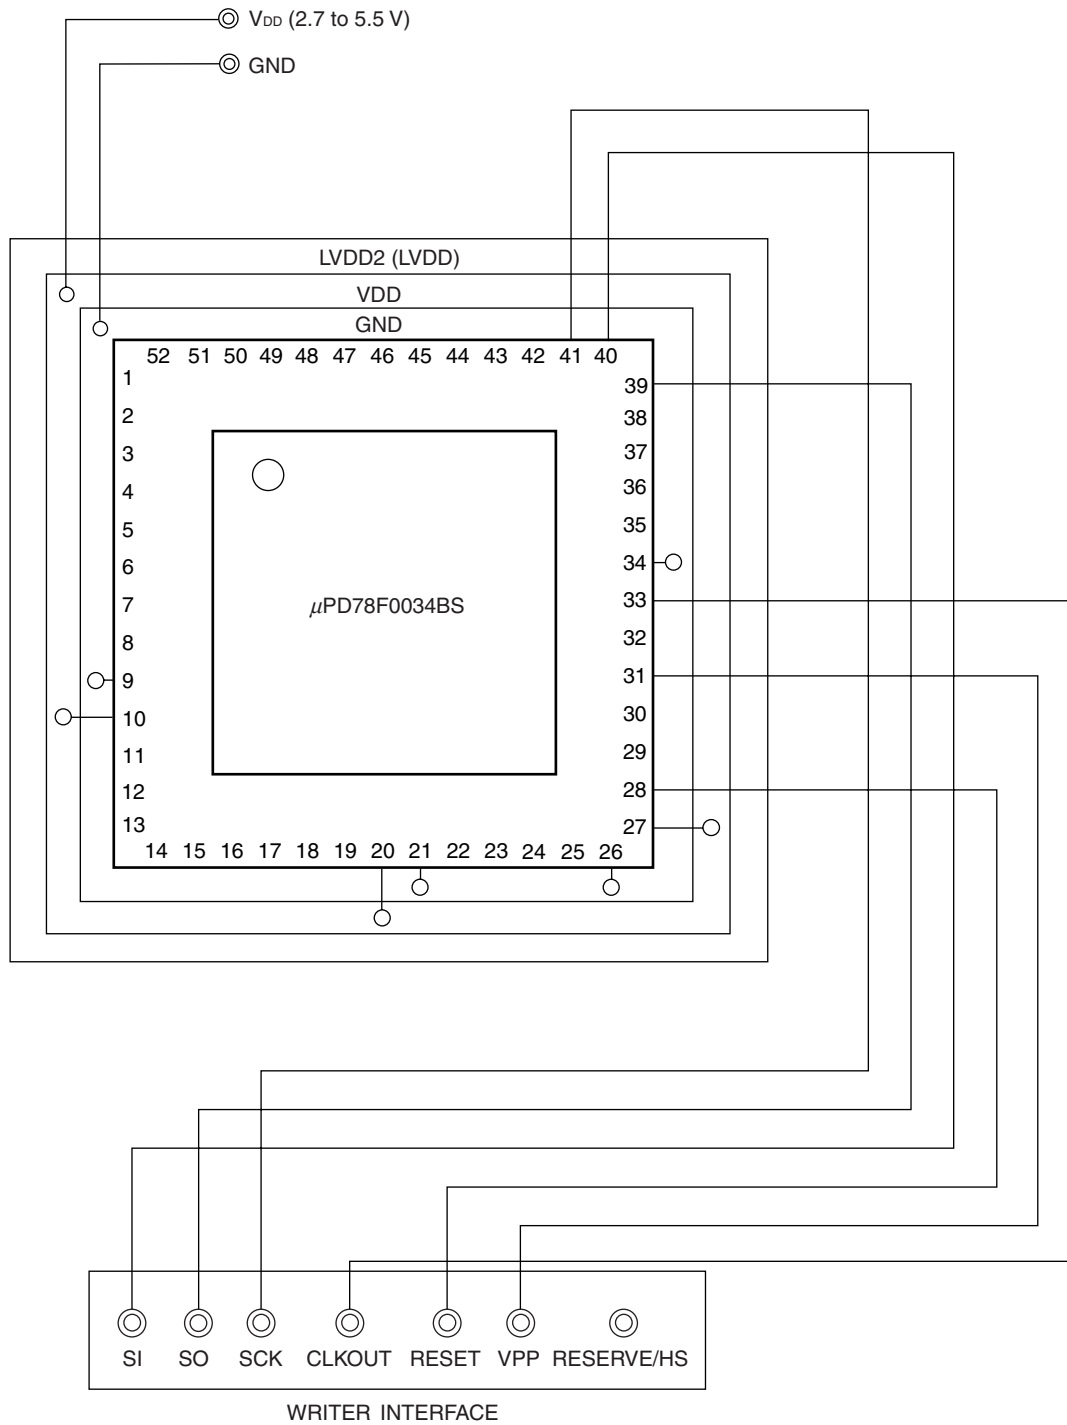

Figure 18-12. Wiring Example for Flash Writing Adapter in Pseudo 3-Wire Serial I/O Mode

## CHAPTER 19 INSTRUCTION SET

This chapter lists each instruction set of the  $\mu$ PD780024AS, 780034AS Subseries in table form. For details of its operation and operation code, refer to the separate document **78K/0 Series Instructions User's Manual (U12326E)**.

### 19.1 Conventions

#### 19.1.1 Operand identifiers and specification methods

Operands are written in “Operand” column of each instruction in accordance with the specification method of the instruction operand identifier (refer to the assembler specifications for detail). When there are two or more methods, select one of them. Alphabetic letters in capitals and symbols, #, !, \$ and [ ] are key words and must be written as they are. Each symbol has the following meaning.

- #: Immediate data specification
- !: Absolute address specification
- \$: Relative address specification
- [ ]: Indirect address specification

In the case of immediate data, describe an appropriate numeric value or a label. When using a label, be sure to write the #, !, \$, and [ ] symbols.

For operand register identifiers, r and rp, either function names (X, A, C, etc.) or absolute names (names in parentheses in the table below, R0, R1, R2, etc.) can be used for specification.

**Table 19-1. Operand Identifiers and Specification Methods**

Identifier	Specification Method
r	X (R0), A (R1), C (R2), B (R3), E (R4), D (R5), L (R6), H (R7)
rp	AX (RP0), BC (RP1), DE (RP2), HL (RP3)
sfr	Special function register symbol <sup>Note</sup>
sfrp	Special function register symbol (16-bit manipulatable register even addresses only) <sup>Note</sup>
saddr	FE20H to FF1FH Immediate data or labels
saddrp	FE20H to FF1FH Immediate data or labels (even address only)
addr16	0000H to FFFFH Immediate data or labels (only even addresses for 16-bit data transfer instructions)
addr11	0800H to 0FFFH Immediate data or labels
addr5	0040H to 007FH Immediate data or labels (even address only)
word	16-bit immediate data or label
byte	8-bit immediate data or label
bit	3-bit immediate data or label
RBn	RB0 to RB3

**Note** Addresses from FFD0H to FFDFH cannot be accessed with these operands.

**Remark** For special function register symbols, refer to **Table 3-5 Special Function Register List**.

**19.1.2 Description of “operation” column**

A:	A register; 8-bit accumulator
X:	X register
B:	B register
C:	C register
D:	D register
E:	E register
H:	H register
L:	L register
AX:	AX register pair; 16-bit accumulator
BC:	BC register pair
DE:	DE register pair
HL:	HL register pair
PC:	Program counter
SP:	Stack pointer
PSW:	Program status word
CY:	Carry flag
AC:	Auxiliary carry flag
Z:	Zero flag
RBS:	Register bank select flag
IE:	Interrupt request enable flag
NMIS:	Non-maskable interrupt servicing flag
( ):	Memory contents indicated by address or register contents in parentheses
X <sub>H</sub> , X <sub>L</sub> :	Higher 8 bits and lower 8 bits of 16-bit register
∧:	Logical product (AND)
∨:	Logical sum (OR)
⊕:	Exclusive logical sum (exclusive OR)
— :	Inverted data
addr16:	16-bit immediate data or label
jdisp8:	Signed 8-bit data (displacement value)

**19.1.3 Description of “flag operation” column**

(Blank):	Not affected
0:	Cleared to 0
1:	Set to 1
×:	Set/cleared according to the result
R:	Previously saved value is restored

## 19.2 Operation List

Instruction Group	Mnemonic	Operands	Byte	Clock		Operation	Flag			
				Note 1	Note 2		Z	AC	CY	
8-bit data transfer	<b>MOV</b>	r, #byte	2	4	–	$r \leftarrow \text{byte}$				
		saddr, #byte	3	6	7	$(\text{saddr}) \leftarrow \text{byte}$				
		sfr, #byte	3	–	7	$\text{sfr} \leftarrow \text{byte}$				
		A, r	Note 3	1	2	–	$A \leftarrow r$			
		r, A	Note 3	1	2	–	$r \leftarrow A$			
		A, saddr		2	4	5	$A \leftarrow (\text{saddr})$			
		saddr, A		2	4	5	$(\text{saddr}) \leftarrow A$			
		A, sfr		2	–	5	$A \leftarrow \text{sfr}$			
		sfr, A		2	–	5	$\text{sfr} \leftarrow A$			
		A, !addr16		3	8	9 + n	$A \leftarrow (\text{addr16})$			
		!addr16, A		3	8	9 + m	$(\text{addr16}) \leftarrow A$			
		PSW, #byte		3	–	7	$\text{PSW} \leftarrow \text{byte}$	x	x	x
		A, PSW		2	–	5	$A \leftarrow \text{PSW}$			
		PSW, A		2	–	5	$\text{PSW} \leftarrow A$	x	x	x
		A, [DE]		1	4	5 + n	$A \leftarrow (\text{DE})$			
		[DE], A		1	4	5 + m	$(\text{DE}) \leftarrow A$			
		A, [HL]		1	4	5 + n	$A \leftarrow (\text{HL})$			
		[HL], A		1	4	5 + m	$(\text{HL}) \leftarrow A$			
		A, [HL + byte]		2	8	9 + n	$A \leftarrow (\text{HL} + \text{byte})$			
		[HL + byte], A		2	8	9 + m	$(\text{HL} + \text{byte}) \leftarrow A$			
	A, [HL + B]		1	6	7 + n	$A \leftarrow (\text{HL} + \text{B})$				
	[HL + B], A		1	6	7 + m	$(\text{HL} + \text{B}) \leftarrow A$				
	A, [HL + C]		1	6	7 + n	$A \leftarrow (\text{HL} + \text{C})$				
	[HL + C], A		1	6	7 + m	$(\text{HL} + \text{C}) \leftarrow A$				
	<b>XCH</b>	A, r	Note 3	1	2	–	$A \leftrightarrow r$			
		A, saddr		2	4	6	$A \leftrightarrow (\text{saddr})$			
		A, sfr		2	–	6	$A \leftrightarrow (\text{sfr})$			
		A, !addr16		3	8	10 + n + m	$A \leftrightarrow (\text{addr16})$			
		A, [DE]		1	4	6 + n + m	$A \leftrightarrow (\text{DE})$			
A, [HL]			1	4	6 + n + m	$A \leftrightarrow (\text{HL})$				
A, [HL + byte]			2	8	10 + n + m	$A \leftrightarrow (\text{HL} + \text{byte})$				
A, [HL + B]			2	8	10 + n + m	$A \leftrightarrow (\text{HL} + \text{B})$				
A, [HL + C]			2	8	10 + n + m	$A \leftrightarrow (\text{HL} + \text{C})$				

- Notes**
1. When the internal high-speed RAM area is accessed or instruction with no data access
  2. When an area except the internal high-speed RAM area is accessed
  3. Except  $r = A$

- Remarks**
1. One instruction clock cycle is one cycle of the CPU clock ( $f_{\text{CPU}}$ ) selected by the processor clock control register (PCC).
  2. This clock cycle applies to internal ROM program.
  3. n is the number of waits when external memory expansion area is read from.
  4. m is the number of waits when external memory expansion area is written to.

Instruction Group	Mnemonic	Operands	Byte	Clock		Operation	Flag			
				Note 1	Note 2		Z	AC	CY	
16-bit data transfer	<b>MOVW</b>	rp, #word	3	6	–	rp ← word				
		saddrp, #word	4	8	10	(saddrp) ← word				
		sfrp, #word	4	–	10	sfrp ← word				
		AX, saddrp	2	6	8	AX ← (saddrp)				
		saddrp, AX	2	6	8	(saddrp) ← AX				
		AX, sfrp	2	–	8	AX ← sfrp				
		sfrp, AX	2	–	8	sfrp ← AX				
		AX, rp	<b>Note 3</b>	1	4	–	AX ← rp			
		rp, AX	<b>Note 3</b>	1	4	–	rp ← AX			
		AX, !addr16		3	10	12 + 2n	AX ← (addr16)			
	!addr16, AX		3	10	12 + 2m	(addr16) ← AX				
	<b>XCHW</b>	AX, rp	<b>Note 3</b>	1	4	–	AX ↔ rp			
8-bit operation	<b>ADD</b>	A, #byte	2	4	–	A, CY ← A + byte	x	x	x	
		saddr, #byte	3	6	8	(saddr), CY ← (saddr) + byte	x	x	x	
		A, r	<b>Note 4</b>	2	4	–	A, CY ← A + r	x	x	x
		r, A		2	4	–	r, CY ← r + A	x	x	x
		A, saddr		2	4	5	A, CY ← A + (saddr)	x	x	x
		A, !addr16		3	8	9 + n	A, CY ← A + (addr16)	x	x	x
		A, [HL]		1	4	5 + n	A, CY ← A + (HL)	x	x	x
		A, [HL + byte]		2	8	9 + n	A, CY ← A + (HL + byte)	x	x	x
		A, [HL + B]		2	8	9 + n	A, CY ← A + (HL + B)	x	x	x
		A, [HL + C]		2	8	9 + n	A, CY ← A + (HL + C)	x	x	x
		<b>ADDC</b>	A, #byte	2	4	–	A, CY ← A + byte + CY	x	x	x
	saddr, #byte		3	6	8	(saddr), CY ← (saddr) + byte + CY	x	x	x	
	A, r		<b>Note 4</b>	2	4	–	A, CY ← A + r + CY	x	x	x
	r, A			2	4	–	r, CY ← r + A + CY	x	x	x
	A, saddr			2	4	5	A, CY ← A + (saddr) + CY	x	x	x
	A, !addr16			3	8	9 + n	A, CY ← A + (addr16) + CY	x	x	x
	A, [HL]			1	4	5 + n	A, CY ← A + (HL) + CY	x	x	x
	A, [HL + byte]			2	8	9 + n	A, CY ← A + (HL + byte) + CY	x	x	x

- Notes**
1. When the internal high-speed RAM area is accessed or instruction with no data access
  2. When an area except the internal high-speed RAM area is accessed
  3. Only when rp = BC, DE or HL
  4. Except r = A

- Remarks**
1. One instruction clock cycle is one cycle of the CPU clock (f<sub>CPU</sub>) selected by the processor clock control register (PCC).
  2. This clock cycle applies to internal ROM program.
  3. n is the number of waits when external memory expansion area is read from.
  4. m is the number of waits when external memory expansion area is written to.

sfrp	MOVW	MOVW						
saddrp	MOVW	MOVW						
!addr16		MOVW						
SP	MOVW	MOVW						

**Note** Only when rp = BC, DE, HL

**(3) Bit manipulation instructions**

MOV1, AND1, OR1, XOR1, SET1, CLR1, NOT1, BT, BF, BTCLR

Second Operand \ First Operand	A.bit	sfr.bit	saddr.bit	PSW.bit	[HL].bit	CY	\$addr16	None
A.bit						MOV1	BT BF BTCLR	SET1 CLR1
sfr.bit						MOV1	BT BF BTCLR	SET1 CLR1
saddr.bit						MOV1	BT BF BTCLR	SET1 CLR1
PSW.bit						MOV1	BT BF BTCLR	SET1 CLR1
[HL].bit						MOV1	BT BF BTCLR	SET1 CLR1
CY	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1			SET1 CLR1 NOT1

**(4) Call instructions/branch instructions**

CALL, CALLF, CALLT, BR, BC, BNC, BZ, BNZ, BT, BF, BTCLR, DBNZ

Second Operand First Operand	AX	!addr16	!addr11	[addr5]	\$addr16
Basic instruction	BR	CALL BR	CALLF	CALLT	BR BC BNC BZ BNZ
Compound instruction					BT BF BTCLR DBNZ

**(5) Other instructions**

ADJBA, ADJBS, BRK, RET, RETI, RETB, SEL, NOP, EI, DI, HALT, STOP

Absolute Maximum Ratings ( $T_A = 25^\circ\text{C}$ )

Parameter	Symbol	Conditions		Ratings	Unit
Supply voltage	$V_{DD}$			-0.3 to +6.5	V
	$AV_{DD}$			-0.3 to $V_{DD} + 0.3$ <sup>Note 1</sup>	V
	$AV_{REF}$			-0.3 to $V_{DD} + 0.3$ <sup>Note 1</sup>	V
	$AV_{SS}$			-0.3 to +0.3	V
	$V_{PP}$	$\mu\text{PD78F0034BS}$ only, <b>Note 2</b>		-0.3 to +10.5	V
Input voltage	$V_{I1}$	P00 to P03, P10 to P13, P20 to P25, P34 to P36, P40 to P47, P50 to P57, P70 to P75, X1, X2, XT1, XT2, RESET		-0.3 to $V_{DD} + 0.3$ <sup>Note 1</sup>	V
Output voltage	$V_O$			-0.3 to $V_{DD} + 0.3$ <sup>Note 1</sup>	V
Analog input voltage	$V_{AN}$	P10 to P13	Analog input pin	$AV_{SS} - 0.3$ to $AV_{REF} + 0.3$ <sup>Note 1</sup> and -0.3 to $V_{DD} + 0.3$ <sup>Note 1</sup>	V
Output current, high	$I_{OH}$	Per pin		-10	mA
		Total for P00 to P03, P40 to P47, P50 to P57, P70 to P75		-15	mA
		Total for P20 to P25, P34 to P36		-15	mA
Output current, low	$I_{OL}$	Per pin for P00 to P03, P20 to P25, P34 to P36, P40 to P47, P70 to P75		20	mA
		Per pin for P50 to P57		30	mA
		Total for P00 to P03, P40 to P47, P70 to P75		50	mA
		Total for P20 to P25		20	mA
		Total for P34 to P36		60	mA
		Total for P50 to P57		100	mA
Operating ambient temperature	$T_A$	During normal operation		-40 to +85	$^\circ\text{C}$
		During flash memory programming		+10 to +80	$^\circ\text{C}$
Storage temperature	$T_{stg}$	Mask ROM version		-65 to +150	$^\circ\text{C}$
		$\mu\text{PD78F0034BS}$		-40 to +125	$^\circ\text{C}$

**Note 1.** 6.5 V or below

(**Note 2** is explained on the following page.)

**Caution** Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

**Remark** Unless otherwise specified, the characteristic of alternate-function pins are the same as those of port pins.

**Note 2.** Make sure that the following conditions of the  $V_{PP}$  voltage application timing are satisfied when the flash memory is written.

- **When supply voltage rises**

$V_{PP}$  must exceed  $V_{DD}$   $10\ \mu\text{s}$  or more after  $V_{DD}$  has reached the lower-limit value (1.8 V) of the operating voltage range (see a in the figure below).

- **When supply voltage drops**

$V_{DD}$  must be lowered  $10\ \mu\text{s}$  or more after  $V_{PP}$  falls below the lower-limit value (1.8 V) of the operating voltage range of  $V_{DD}$  (see b in the figure below).

**Capacitance ( $T_A = 25^\circ\text{C}$ ,  $V_{DD} = V_{SS} = 0\ \text{V}$ )**

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
Input capacitance	$C_{IN}$	f = 1 MHz Unmeasured pins returned to 0 V.				15	pF
I/O capacitance	$C_{IO}$	f = 1 MHz Unmeasured pins returned to 0 V.	P00 to P03, P20 to P25, P34 to P36, P40 to P47, P50 to P57, P70 to P75			15	pF

**Remark** Unless otherwise specified, the characteristic of alternate-function pins are the same as those of port pins.

**Main System Clock Oscillator Characteristics (T<sub>A</sub> = -40 to +85°C, V<sub>DD</sub> = 1.8 to 5.5 V)**

Resonator	Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit		
Ceramic resonator		Oscillation frequency (f <sub>x</sub> ) <sup>Note 1</sup>	4.5 V ≤ V <sub>DD</sub> ≤ 5.5 V	1.0		12.0	MHz		
			3.0 V ≤ V <sub>DD</sub> < 4.5 V	1.0		8.38			
			1.8 V ≤ V <sub>DD</sub> < 3.0 V	1.0		5.0			
		Oscillation stabilization time <sup>Note 2</sup>	After V <sub>DD</sub> reaches oscillation voltage range MIN.			4	ms		
Crystal resonator		Oscillation frequency (f <sub>x</sub> ) <sup>Note 1</sup>	4.5 V ≤ V <sub>DD</sub> ≤ 5.5 V	1.0		12.0	MHz		
			3.0 V ≤ V <sub>DD</sub> < 4.5 V	1.0		8.38			
			1.8 V ≤ V <sub>DD</sub> < 3.0 V	1.0		5.0			
				Oscillation stabilization time <sup>Note 2</sup>	4.0 V ≤ V <sub>DD</sub> ≤ 5.5 V			10	ms
			1.8 V ≤ V <sub>DD</sub> < 4.0 V			30			
External clock		X1 input frequency (f <sub>x</sub> ) <sup>Note 1</sup>	4.5 V ≤ V <sub>DD</sub> ≤ 5.5 V	1.0		12.0	MHz		
			3.0 V ≤ V <sub>DD</sub> < 4.5 V	1.0		8.38			
			1.8 V ≤ V <sub>DD</sub> < 3.0 V	1.0		5.0			
				X1 input high-/low-level width (t <sub>xH</sub> , t <sub>xL</sub> )	4.5 V ≤ V <sub>DD</sub> ≤ 5.5 V	38		500	ns
					3.0 V ≤ V <sub>DD</sub> < 4.5 V	50		500	
			1.8 V ≤ V <sub>DD</sub> < 3.0 V	85		500			

- Notes**
1. Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.
  2. Time required to stabilize oscillation after reset or STOP mode release.

**Cautions** 1. When using the main system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

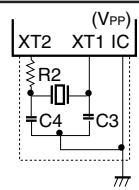

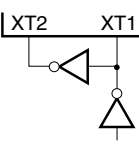

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V<sub>SS1</sub>.
- Do not ground the capacitor to a ground pattern through which a high current flows.
- Do not fetch signals from the oscillator.

2. When the main system clock is stopped and the system is operating on the subsystem clock, wait until the oscillation stabilization time has been secured by the program before switching back to the main system clock.

**Remark** Pin names in parentheses in the figure are intended for the  $\mu$ PD78F0034BS.

Subsystem Clock Oscillator Characteristics ( $T_A = -40$  to  $+85^\circ\text{C}$ ,  $V_{DD} = 1.8$  to  $5.5$  V)

Resonator	Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillation frequency ( $f_{XT}$ ) <sup>Note 1</sup>		32	32.768	35	kHz
		Oscillation stabilization time <sup>Note 2</sup>	$4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$		1.2	2	s
			$1.8\text{ V} \leq V_{DD} < 4.0\text{ V}$			10	
External clock		XT1 input frequency ( $f_{XT}$ ) <sup>Note 1</sup>		32		38.5	kHz
		XT1 input high-/low-level width ( $t_{XTH}$ , $t_{XTL}$ )		12		15	$\mu\text{s}$

- Notes**
1. Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.
  2. Time required to stabilize oscillation after  $V_{DD}$  reaches oscillation voltage range MIN.

**Cautions** 1. When using the subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
  - Do not cross the wiring with the other signal lines.
  - Do not route the wiring near a signal line through which a high fluctuating current flows.
  - Always make the ground point of the oscillator capacitor the same potential as  $V_{SS1}$ .
  - Do not ground the capacitor to a ground pattern through which a high current flows.
  - Do not fetch signals from the oscillator.
2. The subsystem clock oscillator is designed as a low-amplitude circuit for reducing current consumption, and is more prone to malfunction due to noise than the main system clock oscillator. Particular care is therefore required with the wiring method when the subsystem clock is used.

- Remarks**
1. Pin names in parentheses in the figure are intended for the  $\mu\text{PD78F0034BS}$ .
  2. For the resonator selection and oscillator constant of the subsystem clock, customers are required to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

**Caution** The oscillator constant is a reference value based on evaluation in specific environments by the resonator manufacturer. If the oscillator characteristics need to be optimized in the actual application, request the resonator manufacturer for evaluation on the implementation circuit. Note that the oscillation voltage and oscillation frequency merely indicate the characteristics of the oscillator. Use the internal operation conditions of the  $\mu$ PD780024AS and  $\mu$ PD780034AS Subseries within the specifications of the DC and AC characteristics.

**Caution** The oscillator constant is a reference value based on evaluation in specific environments by the resonator manufacturer. If the oscillator characteristics need to be optimized in the actual application, request the resonator manufacturer for evaluation on the implementation circuit. Note that the oscillation voltage and oscillation frequency merely indicate the characteristics of the oscillator. Use the internal operation conditions of the  $\mu$ PD780024AS and  $\mu$ PD780034AS Subseries within the specifications of the DC and AC characteristics.

DC Characteristics (T<sub>A</sub> = -40 to +85°C, V<sub>DD</sub> = 1.8 to 5.5 V) (1/4)

AC Characteristics

(1) Basic operation ( $T_A = -40$  to  $+85^\circ\text{C}$ ,  $V_{DD} = 1.8$  to  $5.5$  V)

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
Cycle time (Min. instruction execution time)	$T_{CY}$	Operating with main system clock	$4.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$	0.166		16	$\mu\text{s}$
			$3.0\text{ V} \leq V_{DD} < 4.5\text{ V}$	0.238		16	$\mu\text{s}$
			$2.7\text{ V} \leq V_{DD} < 3.0\text{ V}$	0.4		16	$\mu\text{s}$
			$1.8\text{ V} \leq V_{DD} < 2.7\text{ V}$	1.6		16	$\mu\text{s}$
		Operating with subsystem clock		103.9 <sup>Note 1</sup>	122	125	$\mu\text{s}$
TI00, TI01 input high-/low-level width	$t_{TIH0}, t_{TIL0}$	$3.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$		$2/f_{sam} + 0.1$ <sup>Note 2</sup>			$\mu\text{s}$
		$2.7\text{ V} \leq V_{DD} < 3.0\text{ V}$		$2/f_{sam} + 0.2$ <sup>Note 2</sup>			$\mu\text{s}$
		$1.8\text{ V} \leq V_{DD} < 2.7\text{ V}$		$2/f_{sam} + 0.5$ <sup>Note 2</sup>			$\mu\text{s}$
TI50, TI51 input frequency	$f_{TI5}$	$2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$		0		4	MHz
		$1.8\text{ V} \leq V_{DD} < 2.7\text{ V}$		0		275	kHz
TI50, TI51 input high-/low-level width	$t_{TIH5}, t_{TIL5}$	$2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$		100			ns
		$1.8\text{ V} \leq V_{DD} < 2.7\text{ V}$		1.8			$\mu\text{s}$
Interrupt request input high-/low- level width	$t_{INTH}, t_{INTL}$	INTP0 to INTP3, P40 to P47	$2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$	1			$\mu\text{s}$
			$1.8\text{ V} \leq V_{DD} < 2.7\text{ V}$	2			$\mu\text{s}$
RESET low-level width	$t_{RSL}$	$2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$		10			$\mu\text{s}$
		$1.8\text{ V} \leq V_{DD} < 2.7\text{ V}$		20			$\mu\text{s}$

**Notes** 1. Value when the external clock is used. When a crystal resonator is used, it is 114  $\mu\text{s}$  (MIN.).

2. Selection of  $f_{sam} = f_x, f_x/4, f_x/64$  is possible using bits 0 and 1 (PRM00, PRM01) of prescaler mode register 0 (PRM0). However, if the TI00 valid edge is selected as the count clock, the value becomes  $f_{sam} = f_x/8$ .

**$T_{CY}$  vs.  $V_{DD}$  (main system clock operation)**

(2) Serial interface ( $T_A = -40$  to  $+85^\circ\text{C}$ ,  $V_{DD} = 1.8$  to  $5.5$  V) (1/2)

 (a) 3-wire serial I/O mode ( $\overline{\text{SCK3n}}$ ... Internal clock output)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$\overline{\text{SCK3n}}$ cycle time	$t_{\text{KCY1}}$	$4.5 \text{ V} \leq V_{\text{DD}} \leq 5.5 \text{ V}$	666			ns
		$3.0 \text{ V} \leq V_{\text{DD}} < 4.5 \text{ V}$	954			ns
		$2.7 \text{ V} \leq V_{\text{DD}} < 3.0 \text{ V}$	1600			ns

## A/D Converter Characteristics

(a) 8-bit A/D converter ( $\mu$ PD780024AS Subseries)(T<sub>A</sub> = -40 to +85°C, V<sub>DD</sub> = AV<sub>DD</sub> = 1.8 to 5.5 V, AV<sub>SS</sub> = V<sub>SS</sub> = 0 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Resolution			8	8	8	bit
Overall error <sup>Notes 1, 2</sup>		4.0 V ≤ AV <sub>REF</sub> ≤ 5.5 V			±0.4	%FSR
		2.7 V ≤ AV <sub>REF</sub> < 4.0 V			±0.6	%FSR
		1.8 V ≤ AV <sub>REF</sub> < 2.7 V			±1.2	%FSR
Conversion time	t <sub>CONV</sub>	4.5 V ≤ AV <sub>DD</sub> ≤ 5.5 V	12		96	μs
		4.0 V ≤ AV <sub>DD</sub> < 4.5 V	14		96	μs
		2.7 V ≤ AV <sub>DD</sub> < 4.0 V	17		96	μs
		1.8 V ≤ AV <sub>DD</sub> < 2.7 V	28		96	μs
Analog input voltage	V <sub>AIN</sub>		0		AV <sub>REF</sub>	V
Reference voltage	AV <sub>REF</sub>		1.8		AV <sub>DD</sub>	V
Resistance between AV <sub>REF</sub> and AV <sub>SS</sub>	R <sub>REF</sub>	During A/D conversion operation	20	40		kΩ

**Notes** 1. Excludes quantization error (±1/2 LSB).

2. This value is indicated as a ratio (%FSR) to the full-scale value.

(b) 10-bit A/D converter ( $\mu$ PD780034AS Subseries)

( $T_A = -40$  to  $+85^\circ\text{C}$ ,  $V_{DD} = AV_{DD} = 1.8$  to  $5.5$  V,  $AV_{SS} = V_{SS} = 0$  V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Resolution			10	10	10	bit
Overall error <sup>Notes 1, 2</sup>		$4.0\text{ V} \leq AV_{REF} \leq 5.5\text{ V}$		$\pm 0.2$	$\pm 0.4$	%FSR
		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$		$\pm 0.3$	$\pm 0.6$	%FSR
		$1.8\text{ V} \leq AV_{REF} < 2.7\text{ V}$		$\pm 0.6$	$\pm 1.2$	%FSR
Conversion time	$t_{CONV}$	$4.5\text{ V} \leq AV_{DD} \leq 5.5\text{ V}$	12		96	$\mu\text{s}$
		$4.0\text{ V} \leq AV_{DD} < 4.5\text{ V}$	14		96	$\mu\text{s}$
		$2.7\text{ V} \leq AV_{DD} < 4.0\text{ V}$	17		96	$\mu\text{s}$
		$1.8\text{ V} \leq AV_{DD} < 2.7\text{ V}$	28		96	$\mu\text{s}$
Zero-scale error <sup>Notes 1, 2</sup>		$4.0\text{ V} \leq AV_{REF} \leq 5.5\text{ V}$			$\pm 0.4$	%FSR
		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$			$\pm 0.6$	%FSR
		$1.8\text{ V} \leq AV_{REF} < 2.7\text{ V}$			$\pm 1.2$	%FSR
Full-scale error <sup>Notes 1, 2</sup>		$4.0\text{ V} \leq AV_{REF} \leq 5.5\text{ V}$			$\pm 0.4$	%FSR
		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$			$\pm 0.6$	%FSR
		$1.8\text{ V} \leq AV_{REF} < 2.7\text{ V}$			$\pm 1.2$	%FSR
Integral linearity error <sup>Note 1</sup>		$4.0\text{ V} \leq AV_{REF} \leq 5.5\text{ V}$			$\pm 2.5$	LSB
		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$			$\pm 4.5$	LSB
		$1.8\text{ V} \leq AV_{REF} < 2.7\text{ V}$			$\pm 8.5$	LSB
Differential linearity error <sup>Note 1</sup>		$4.0\text{ V} \leq AV_{REF} \leq 5.5\text{ V}$			$\pm 1.5$	LSB
		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$			$\pm 2.0$	LSB
		$1.8\text{ V} \leq AV_{REF} < 2.7\text{ V}$			$\pm 3.5$	LSB
Analog input voltage	$V_{AIN}$		0		$AV_{REF}$	V
Reference voltage	$AV_{REF}$		1.8		$AV_{DD}$	V
Resistance between $AV_{REF}$ and $AV_{SS}$	$R_{REF}$	During A/D conversion operation	20	40		k $\Omega$

- Notes**
1. Excludes quantization error ( $\pm 1/2$  LSB).
  2. This value is indicated as a ratio (%FSR) to the full-scale value.

**Remark** The impedance of the analog input pins is shown below.

[Equivalent circuit]

[Parameter value]

(TYP.)

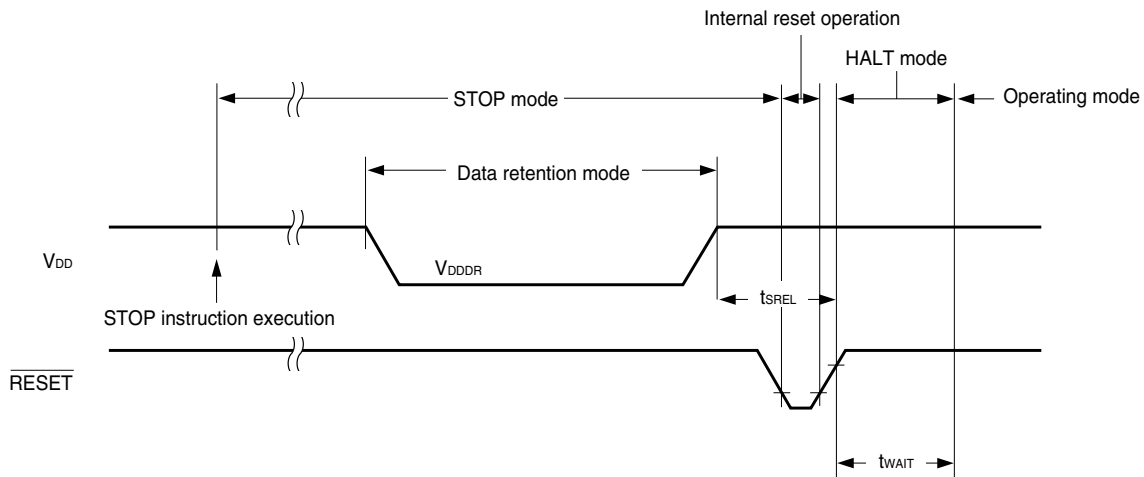

$AV_{DD}$	R1	R2	C1	C2	C3
2.7 V	12 k $\Omega$	8.0 k $\Omega$	3.0 pF	3.0 pF	2.0 pF
4.5 V	4 k $\Omega$	2.7 k $\Omega$	3.0 pF	1.4 pF	2.0 pF

**Data Memory STOP Mode Low Supply Voltage Data Retention Characteristics (T<sub>A</sub> = -40 to +85°C)**

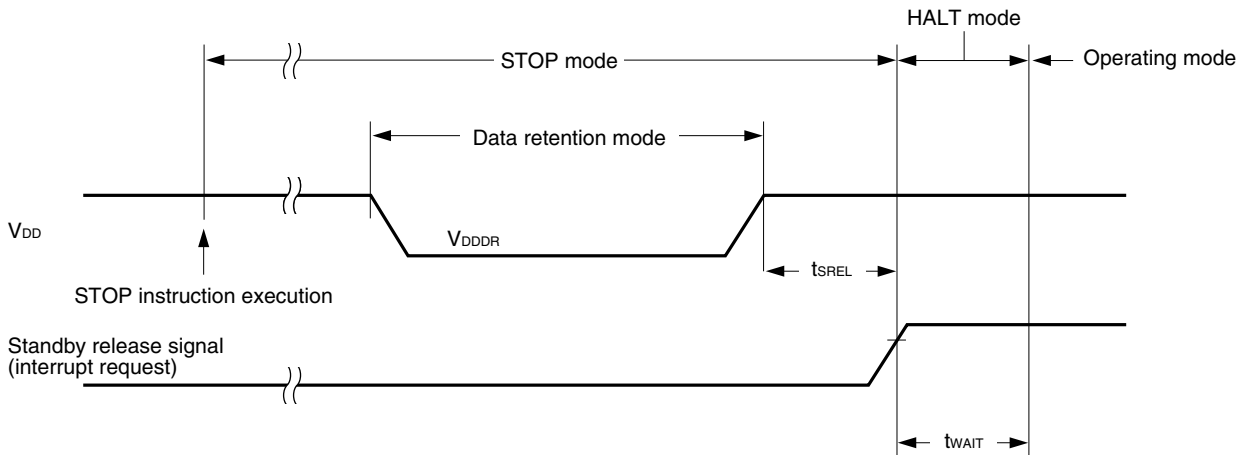

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Data retention power supply voltage	V <sub>DDDR</sub>		1.6		5.5	V
Data retention power supply current	I <sub>DDDR</sub>	V <sub>DDDR</sub> = 1.6 V (Subsystem clock stopped and feedback resistor disconnected)		0.1	30	μA
Release signal set time	t <sub>SREL</sub>		0			μs
Oscillation stabilization wait time	t <sub>WAIT</sub>	Release by $\overline{\text{RESET}}$		2 <sup>17</sup> /f <sub>x</sub>		s
		Release by interrupt request		Note		s

**Note** Selection of 2<sup>12</sup>/f<sub>x</sub>, 2<sup>14</sup>/f<sub>x</sub>, 2<sup>15</sup>/f<sub>x</sub>, 2<sup>16</sup>/f<sub>x</sub>, and 2<sup>17</sup>/f<sub>x</sub> is possible using bits 0 to 2 (OSTS0 to OSTS2) of the oscillation stabilization time select register (OSTS).

**Data Retention Timing (STOP Mode Release by  $\overline{\text{RESET}}$ )**

**Data Retention Timing (Standby Release Signal: STOP Mode Release by Interrupt Request Signal)**

**Flash Memory Programming Characteristics:  $\mu$ PD78F0034BS**  
**( $T_A = +10$  to  $+40^\circ\text{C}$ ,  $V_{DD} = AV_{DD} = 1.8$  to  $5.5$  V,  $V_{SS} = AV_{SS} = 0$  V)**

**(1) Write erase characteristics**

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit	
Operating frequency	$f_x$	4.5 V $\leq$ $V_{DD}$ $\leq$ 5.5 V		1.0		10.0	MHz	
		3.0 V $\leq$ $V_{DD}$ < 4.5 V		1.0		8.38	MHz	
		2.7 V $\leq$ $V_{DD}$ < 3.0 V		1.0		5.00	MHz	
		1.8 V $\leq$ $V_{DD}$ < 2.7 V		1.0		1.25	MHz	
$V_{PP}$ supply voltage	$V_{PP2}$	During flash memory programming		9.7	10.0	10.3	V	
$V_{DD}$ supply current <sup>Note 1</sup>	$I_{DD}$	$V_{PP} = V_{PP2}$	10 MHz crystal oscillation operating mode	$V_{DD} = 5.0$ V $\pm 10\%$			30	mA
			8.38 MHz crystal oscillation operating mode	$V_{DD} = 5.0$ V $\pm 10\%$			24	mA
				$V_{DD} = 3.0$ V $\pm 10\%$			17	mA
$V_{PP}$ supply current	$I_{PP}$	$V_{PP} = V_{PP2}$				100	mA	
Step erase time <sup>Note 2</sup>	$T_{er}$			0.199	0.2	0.201	s	
Overall erase time <sup>Note 3</sup>	$T_{era}$	When step erase time = 0.2 s				20	s/chip	
Writeback time <sup>Note 4</sup>	$T_{wb}$			49.4	50	50.6	ms	
Number of writebacks per 1 writeback command <sup>Note 5</sup>	$C_{wb}$	When writeback time = 50 ms				60	Times	
Number of erases/writebacks	$C_{erwb}$					16	Times	
Step write time <sup>Note 6</sup>	$T_{wr}$			48	50	52	$\mu$ s	
Overall write time per word <sup>Note 7</sup>	$T_{wrw}$	When step write time = 50 $\mu$ s (1 word = 1 byte)		48		520	$\mu$ s	
Number of rewrites per chip <sup>Note 8</sup>	$C_{erwr}$	1 erase + 1 write after erase = 1 rewrite				20	Times/area	

- Notes**
1. The  $AV_{DD}$  current and port current (the current flowing through on-chip pull-up resistors) are not included.
  2. The recommended setting value of the step erase time is 0.2 s.
  3. The prewrite time before erasure and the erase verify time (writeback time) are not included.
  4. The recommended setting value of the writeback time is 50 ms.
  5. Writeback is executed once by the issuance of the writeback command. Therefore, the number of retries must be the maximum value minus the number of commands issued.
  6. The recommended setting value of the step write time is 50  $\mu$ s.
  7. The actual write time per word is 100  $\mu$ s longer. The internal verify time during or after a write is not included.
  8. When a product is first written after shipment, “erase  $\rightarrow$  write” and “write only” are both taken as one rewrite.

Example: P: Write, E: Erase

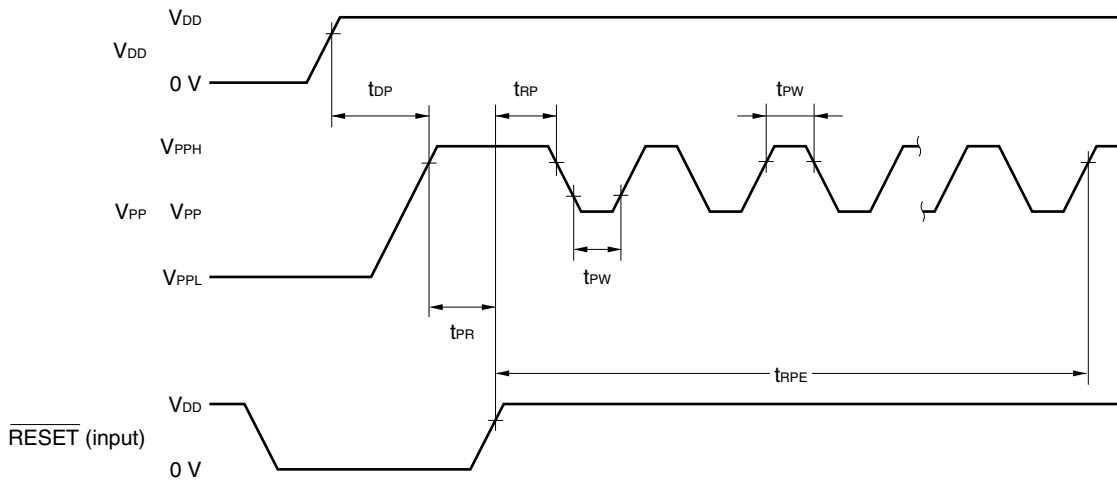

Shipped product  $\rightarrow$  P  $\rightarrow$  E  $\rightarrow$  P  $\rightarrow$  E  $\rightarrow$  P: 3 rewrites

Shipped product  $\rightarrow$  E  $\rightarrow$  P  $\rightarrow$  E  $\rightarrow$  P  $\rightarrow$  E  $\rightarrow$  P: 3 rewrites

(2) Serial write operation characteristics

## CHAPTER 22 RECOMMENDED SOLDERING CONDITIONS

This product should be soldered and mounted under the following recommended conditions.

For soldering methods and conditions other than those recommended below, contact an NEC Electronics sales representative.

For technical information, see the following website.

Semiconductor Device Mount Manual (<http://www.necel.com/pkg/en/mount/index.html>)

**Table 22-1. Surface Mounting Type Soldering Conditions (1/2)**

## APPENDIX B DEVELOPMENT TOOLS

The following development tools are available for the development of systems that employ the  $\mu$ PD780024AS, 780034AS Subseries.

Figure B-1 shows the development tool configuration.

- **Support for PC98-NX series**

Unless otherwise specified, products compatible with IBM PC/AT™ computers are compatible with PC98-NX series computers. When using PC98-NX series computers, refer to the explanation for IBM PC/AT computers.

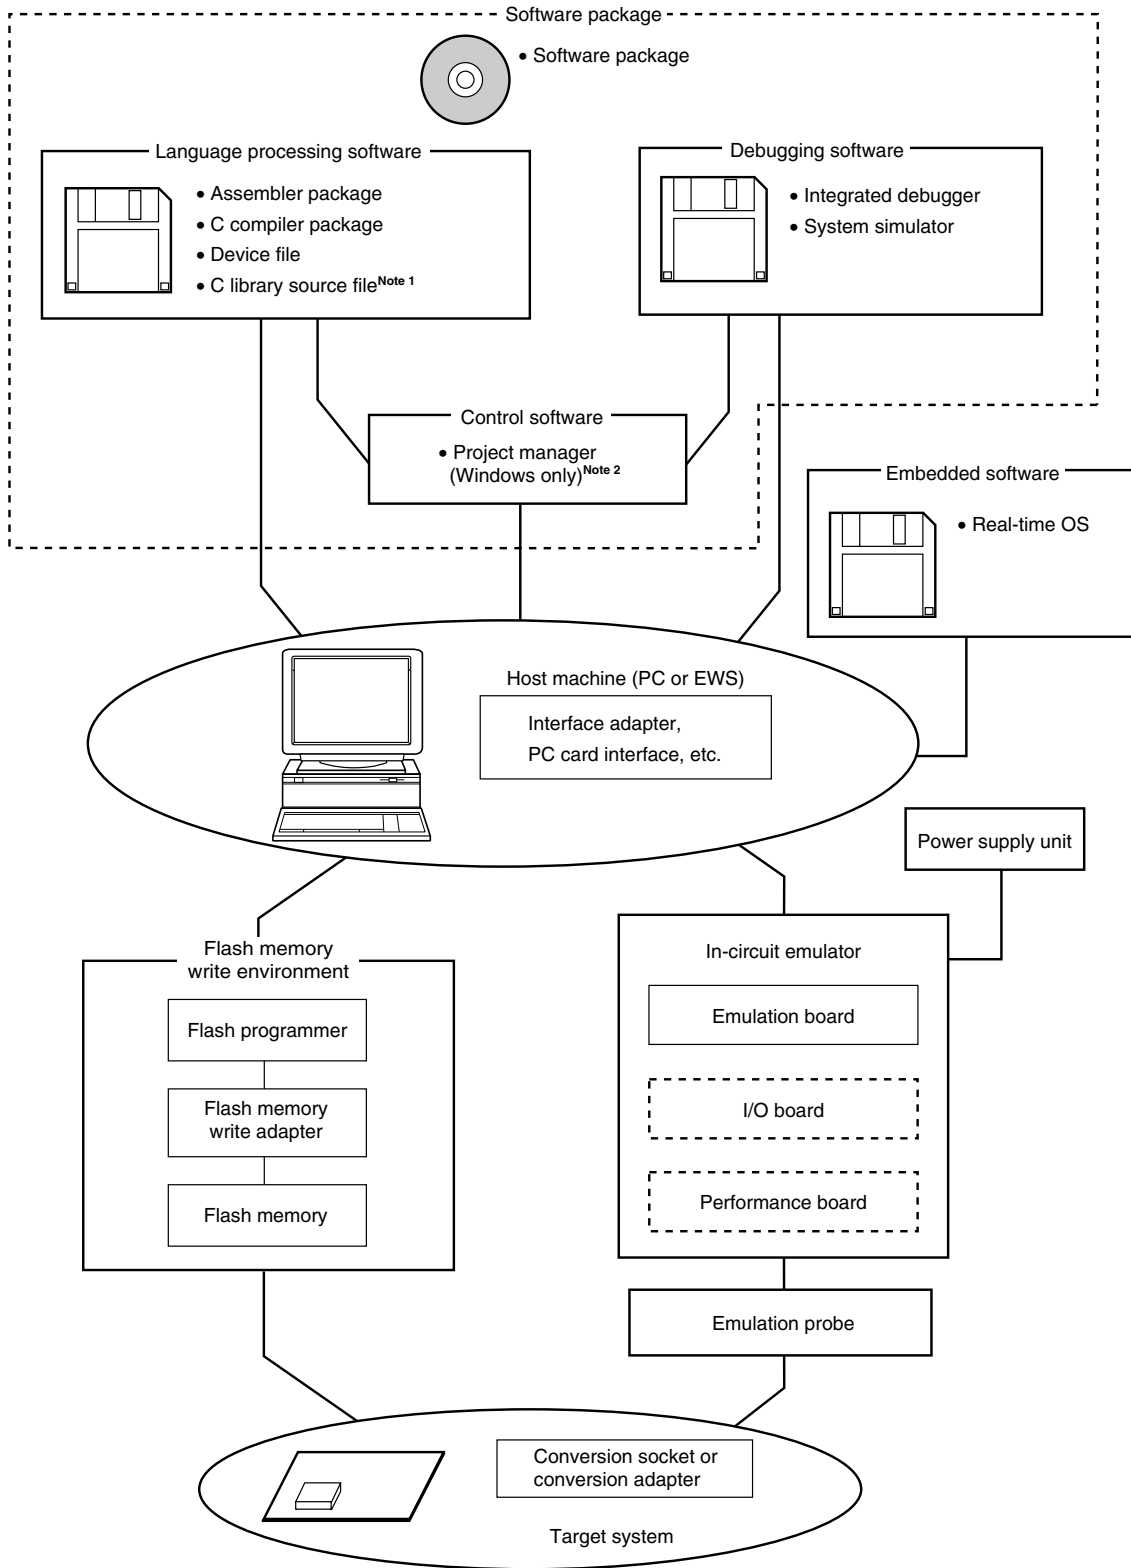

- **Windows**

Unless otherwise specified, "Windows" means the following OSs.

- Windows 3.1
- Windows 95
- Windows 98
- Windows 2000
- Windows NT™ Ver. 4.0

Figure B-1. Development Tool Configuration

- Notes**
1. The C library source file is not included in the software package.
  2. The project manager is included in the assembler package.  
The project manager is only used for Windows.

★ B.1 Software Package

SP78K0 Software package	This package contains various software tools for 78K/0 Series development. The following tools are included. RA78K0, CC78K0, ID78K0-NS, SM78K0, and various device files
	Part Number: $\mu$ SxxxxSP78K0

**Remark** xxxx in the part number differs depending on the OS used.

$\mu$ SxxxxSP78K0

xxxx	Host Machine	OS	Supply Medium
AB17	PC-9800 series,	Windows (Japanese version)	CD-ROM
BB17	IBM PC/AT compatibles	Windows (English version)	

B.2 Language Processing Software

RA78K0 Assembler package	<p>This assembler converts programs written in mnemonics into object codes executable with a microcontroller.</p> <p>Further, this assembler is provided with functions capable of automatically creating symbol tables and branch instruction optimization.</p> <p>This assembler should be used in combination with device file (DF780024 or DF780034) (sold separately).</p> <p><b>&lt;Precaution when using RA78K0 in PC environment&gt;</b> This assembler package is a DOS-based application. It can also be used in Windows, however, by using the project manager (included in the assembler package) on Windows.</p> <p>Part Number: <math>\mu</math>SxxxxRA78K0</p>
CC78K0 C compiler package	<p>This compiler converts programs written in C language into object codes executable with a microcontroller.</p> <p>This compiler should be used in combination with an assembler package and device file (both sold separately).</p> <p><b>&lt;Precaution when using CC78K0 in PC environment&gt;</b> This C compiler package is a DOS-based application. It can also be used in Windows, however, by using the project manager (included in the assembler package) on Windows.</p> <p>Part Number: <math>\mu</math>SxxxxCC78K0</p>
DF780024 <sup>Note 1</sup> DF780034 <sup>Note 1</sup> Device file	<p>This file contains information peculiar to the device.</p> <p>This device file should be used in combination with tool (RA78K0, CC78K0, SM78K0, ID78K0-NS, and RX78K0) (all sold separately). The corresponding OS and host machine differ depending on the tool used.</p> <ul style="list-style-type: none"> <li>DF780024: <math>\mu</math>PD780024A, 780024AY, 780024AS Subseries</li> <li>DF780034: <math>\mu</math>PD780034A, 780034AY, 780034AS Subseries</li> </ul> <p>Part Number: <math>\mu</math>SxxxxDF780024, <math>\mu</math>SxxxxDF780034</p>
CC78K0-L <sup>Note 2</sup> C library source file	<p>This is a source file of functions configuring the object library included in the C compiler package.</p> <p>This file is required to match the object library included in C compiler package to the user's specifications. It does not depend on the operating environment because it is a source file.</p> <p>Part Number: <math>\mu</math>SxxxxCC78K0-L</p>

- Notes**
1. The DF780024 and DF780034 can be used in common with the RA78K0, CC78K0, SM78K0, ID78K0-NS, and RX78K0.
  2. CC78K0-L is not included in the software package (SP78K0).

★ **Remark** xxxx in the part number differs depending on the host machine and OS used.

### B.3 Control Software

Project manager	<p>This is control software designed to enable efficient user program development in the Windows environment. All operations used in development of a user program, such as starting the editor, building, and starting the debugger, can be performed from the project manager.</p> <p><b>&lt;Caution&gt;</b> The project manager is included in the assembler package (RA78K0). It can only be used in Windows.</p>
-----------------	---

## ★ B.4 Flash Memory Writing Tools

Flashpro III (part number: FL-PR3, PG-FP3) Flashpro IV (part number: FL-PR4, PG-FP4) Flash programmer	Flash programmer dedicated to microcontrollers with on-chip flash memory.
FA-52GB-8ET Flash memory writing adapter	Flash memory writing adapter used connected to the Flashpro III and Flashpro IV. • FA-52GB-8ET: 52-pin plastic LQFP (GB-8ET type)

**Remark** FL-PR3, FL-PR4, and FA-52GB-8ET are products of Naito Densai Machida Mfg. Co., Ltd.  
Contact: +81-45-475-4191 Naito Densai Machida Mfg. Co., Ltd.

## B.5 Debugging Tools (Hardware)

IE-78K0-NS In-circuit emulator	The in-circuit emulator serves to debug hardware and software when developing application systems using a 78K/0 Series product. It corresponds to the integrated debugger (ID78K0-NS). This emulator should be used in combination with a power supply unit, emulation probe, and interface adapter which is required to connect this emulator to the host machine.
IE-78K0-NS-PA Performance board	This board is connected to the IE-78K0-NS to expand its functions. Adding this board adds a coverage function and enhances debugging functions such as tracer and timer functions.
★ IE-78K0-NS-A In-circuit emulator	A combination of the IE-78K0-NS and IE-78K0-NS-PA.
IE-70000-MC-PS-B Power supply unit	This adapter is used for supplying power from a receptacle of 100 V to 240 V AC.
IE-70000-98-IF-C Interface adapter	This adapter is required when using a PC-9800 series computer (except notebook type) as the host machine (C bus compatible).
IE-70000-CD-IF-A PC card interface	This is PC card and interface cable required when using a notebook-type computer as the host machine (PCMCIA socket compatible).
IE-70000-PC-IF-C Interface adapter	This adapter is required when using an IBM PC/AT compatible computer as the host machine (ISA bus compatible).
IE-70000-PCI-IF-A Interface adapter	This adapter is required when using a computer with a PCI bus as the host machine.
IE-780034-NS-EM1 Emulation Board	This board emulates the operations of the peripheral hardware peculiar to a device. It should be used in combination with an in-circuit emulator.
780034AS 52Pin Board Conversion Board	This conversion board is used to connect the emulation probe to the emulation board.
NP-H52GB-TQ Emulation Probe	This probe is used to connect the in-circuit emulator to a target system and is designed for use with 52-pin plastic LQFP (GB-8ET type).
TGB-052SBP Conversion Adapter	This conversion socket connects the NP-H52GB-TQ to a target system board designed for a 52-pin plastic LQFP (GB-8ET type).

- Remarks**
1. NP-H52GB-TQ is a product of Naito Densai Machida Mfg. Co., Ltd.  
Inquiry: Naito Densai Machida Mfg. Co., Ltd. (TEL +81-45-475-4191)
  2. TGB-052SBP is a product of TOKYO ELETECH CORPORATION.  
Inquiry: Daimaru Kogyo, Ltd.: Tokyo Electronics Department (TEL +81-3-3820-7112)  
Osaka Electronics Department (TEL +81-6-6244-6672)
  3. TGB-052SBP is sold in one units.

**B.6 Debugging Tools (Software)**

SM78K0 System simulator	This is a system simulator for the 78K/0 Series. The SM78K0 is Windows-based software. It is used to perform debugging at the C source level or assembler level while simulating the operation of the target system on a host machine. Use of the SM78K0 allows the execution of application logical testing and performance testing on an independent basis from hardware development, thereby providing higher development efficiency and software quality. The SM78K0 should be used in combination with the device file (DF780024 or DF780034) (sold separately).
Part Number: $\mu$ SxxxxSM78K0	
ID78K0-NS Integrated debugger (supporting in-circuit emulators IE-78K0-NS and IE-78K0-NS-A)	This debugger supports the in-circuit emulators for the 78K/0 Series. The ID78K0-NS is Windows-based software. It has improved C-compatible debugging functions and can display the results of tracing with the source program using an integrating window function that associates the source program, disassemble display, and memory display with the trace result. It should be used in combination with the device file (sold separately).
Part Number: $\mu$ SxxxxID78K0-NS	

**Remark** xxxx in the part number differs depending on the host machine and OS used.

$\mu$ SxxxxSM78K0

$\mu$ SxxxxID78K0-NS

xxxx	Host machine	OS	Supply medium
AB13	PC-9800 series,	Japanese Windows	3.5-inch 2HD FD
BB13	IBM PC/AT or compatibles	English Windows	
AB17		Japanese Windows	CD-ROM
BB17		English Windows	

**B.7 Embedded Software**

RX78K0 Real-time OS	RX78K0 is a real-time OS conforming to the $\mu$ ITRON specifications. A tool (configurator) for generating the nucleus of RX78K0 and multiple information tables is supplied. It is used in combination with an assembler package (RA78K0) and device file (DF780024 or DF780034) (both sold separately). <b>&lt;Precaution when using RX78K0 in PC environment&gt;</b> The real-time OS is a DOS-based application. It should be used from the DOS prompt when using in Windows. <hr/> Part number: $\mu$ SxxxxRX78013- $\Delta\Delta\Delta\Delta$
------------------------	---

**Caution** When purchasing the RX78K0, fill in the purchase application form in advance and sign the user agreement.

**Remark** xxxx and  $\Delta\Delta\Delta\Delta$  in the part number differ depending on the host machine and OS used.

$\mu$ SxxxxRX78013- $\Delta\Delta\Delta\Delta$

$\Delta\Delta\Delta\Delta$	Product Outline	Maximum Number for Use in Mass Production
001	Evaluation object	Do not use for mass-produced product.
100K	Mass-production object	0.1 million units
001M		1 million units
010M		10 million units
S01	Source program	Source program for mass-produced object

★

xxxx	Host Machine	OS	Supply Medium
AA13	PC-9800 series	Windows (Japanese version)	3.5-inch 2HD FD
AB13	IBM PC/AT compatibles	Windows (Japanese version)	
BB13		Windows (English version)	

The following shows a diagram of the connection conditions between the emulation probe and conversion adapter. Design your system making allowances for conditions such as the shape of parts mounted on the target system, as shown below.

Of the products described in this chapter, the emulation probe is a product of Naito Densetsu Machida Mfg. Co., Ltd., and the conversion adapter is a product of TOKYO ELETECH CORPORATION.

**Table C-1. Distance Between IE System and Conversion Adapter**

Emulation Probe	Conversion Adapter	Distance Between IE System and Conversion Adapter
NP-H52GB-TQ	TGB-052SBP	370 mm

Timer clock select register 50 (TCL50) ... 143  
Timer clock select register 51 (TCL51) ... 143  
Transmit shift register 0 (TXS0) ... 223

**[W]**

Watch timer operation mode register (WTM) ... 164  
Watchdog timer clock select register (WDCS) ... 168  
Watchdog timer mode register (WDTM) ... 169

## D.2 Register Symbol Index

### [A]

ADCR0: A/D conversion result register 0 ... 179, 201  
ADM0: A/D converter mode register 0 ... 181, 203  
ADS0: Analog input channel specification register 0 ... 182, 204  
ASIM0: Asynchronous serial interface mode register 0 ... 225  
ASIS0: Asynchronous serial interface status register 0 ... 224

### [B]

BRGC0: Baud rate generator control register 0 ... 227

### [C]

CKS: Clock output select register ... 173  
CR00: 16-bit timer capture/compare register 00 ... 109  
CR01: 16-bit timer capture/compare register 01 ... 110  
CR50: 8-bit timer compare register 50 ... 142  
CR51: 8-bit timer compare register 51 ... 142  
CRC0: Capture/compare control register 0 ... 112  
CSIM30: Serial operation mode register 30 ... 250  
CSIM31: Serial operation mode register 31 ... 250

### [E]

EGN: External interrupt falling edge enable register ... 267  
EGP: External interrupt rising edge enable register ... 267

### [I]

IF0H: Interrupt request flag register 0H ... 264  
IF0L: Interrupt request flag register 0L ... 264  
IF1L: Interrupt request flag register 1L ... 264  
IMS: Memory size switching register ... 292

### [M]

MEM: Memory expansion mode register ... 267  
MK0H: Interrupt mask flag register 0H ... 265  
MK0L: Interrupt mask flag register 0L ... 265  
MK1L: Interrupt mask flag register 1L ... 265

### [O]

OSTS: Oscillation stabilization time select register ... 97, 280

### [P]

P0: Port 0 ... 73  
P1: Port 1 ... 75  
P2: Port 2 ... 76  
P3: Port 3 ... 79  
P4: Port 4 ... 82  
P5: Port 5 ... 83

P7: Port 7 ... 84  
PCC: Processor clock control register ... 95  
PM0: Port mode register 0 ... 87  
PM2: Port mode register 2 ... 87, 228, 253  
PM3: Port mode register 3 ... 87, 253  
PM4: Port mode register 4 ... 87  
PM5: Port mode register 5 ... 87  
PM7: Port mode register 7 ... 87, 115, 147, 175  
PR0H: Priority specification flag register 0H ... 266  
PR0L: Priority specification flag register 0L ... 266  
PR1L: Priority specification flag register 1L ... 266  
PRM0: Prescaler mode register 0 ... 114  
PSW: Program status word ... 51, 268  
PU0: Pull-up resistor option register 0 ... 90  
PU2: Pull-up resistor option register 2 ... 90  
PU3: Pull-up resistor option register 3 ... 90

WDTM: Watchdog timer mode register ... 169  
WTM: Watch timer operation mode register ... 164

## APPENDIX E REVISION HISTORY

The following table shows the revision history up to the previous editions. The “Applied to:” column indicates the chapters of each edition in which the revision was applied.

(1/3)

Edition	Major Revision from Previous Edition	Applied to:
2nd	<ul style="list-style-type: none"> <li>• Addition of following products to target devices  <math>\mu</math>PD780021AS(A), 780022AS(A), 780023AS(A), 780024AS(A), 780031AS(A),  780032AS(A), 780033AS(A), 780034AS(A), 78F0034BS(A)</li> <li>• Change of status of all products from “under development” to “developed”</li> </ul>	Throughout
	<ul style="list-style-type: none"> <li>• Addition of <b>1.4 Quality Grade</b></li> <li>• Modification of <b>1.6 78K/0 Series Lineup</b></li> <li>• Addition of <b>1.9 Difference Between Standard Grade and Special Grade</b></li> </ul>	<b>CHAPTER 1 OUTLINE</b>
	Addition of description to <b>18.2 Flash Memory Programming</b>	<b>CHAPTER 18</b> $\mu$ PD78F0034BS
	Addition of chapter	<b>CHAPTER 20</b> <b>ELECTRICAL</b> <b>SPECIFICATIONS</b>
	Addition of chapter	<b>CHAPTER 21</b> <b>PACKAGE DRAWING</b>
	Addition of chapter	<b>CHAPTER 22</b> <b>RECOMMENDED</b> <b>SOLDERING</b> <b>CONDITIONS</b>
	Addition of description to <b>B.2 Flash Memory Writing Tools</b>	<b>APPENDIX B</b> <b>DEVELOPMENT TOOLS</b>
	Addition of chapter	<b>APPENDIX E</b> <b>REVISION HISTORY</b>
3rd	Addition of description of expanded specification (12 MHz)	Throughout
	Revision of <b>1.6 78K/0 Series Lineup</b>	<b>CHAPTER 1 OUTLINE</b>
	Addition of description about pin handling to <b>2.2.16 V<sub>PP</sub> (flash memory versions only)</b>	<b>CHAPTER 2 PIN</b> <b>FUNCTION</b>
	Modification of description in <b>Table 2-1 Pin I/O Circuit Types</b>	
	Addition of description about programming area to <b>3.1.2 Internal data memory space</b>	<b>CHAPTER 3 CPU</b> <b>ARCHITECTURE</b>
	Modification of <b>Figure 3-14 Data to Be Saved to Stack Memory</b> and <b>Figure 3-15 Data to Be Restored from Stack Memory</b>	
	Modification of [Description example] in <b>3.4.4 Short direct addressing</b>	
	Addition of [Illustration] to <b>3.4.7 Based addressing, 3.4.8 Based indexed addressing, and 3.4.9 Stack addressing</b>	
	Modification of port block diagrams ( <b>Figure 4-2 to Figure 4-15</b> )	<b>CHAPTER 4 PORT</b> <b>FUNCTIONS</b>
	Addition of <b>Table 4-3 Port Mode Registers and Output Latch Setting When Alternate Function Is Used</b>	
	Addition of description of internal feedback resistor and oscillation stabilization time select register (OSTS) to <b>5.3 Registers Controlling Clock Generator</b>	<b>CHAPTER 5 CLOCK</b> <b>GENERATOR</b>

Edition	Major Revision from Previous Edition	Applied to:
3rd	Modification of <b>Figure 6-1 Block Diagram of 16-Bit Timer/Event Counter 0</b>	<b>CHAPTER 6 16-BIT TIMER/EVENT COUNTER 0</b>
	Change of <b>Table 6-2 TI00/TO0/P70 Pin Valid Edge and CR00, CR01 Capture Trigger</b> and <b>Table 6-3 TI01/P71 Pin Valid Edge and CR00 Capture Trigger</b> in the previous edition to <b>Table 6-2 CR00 Capture Trigger and Valid Edges of TI00 and TI01 Pins</b> and <b>Table 6-3 CR01 Capture Trigger and Valid Edge of TI00 Pin (CRC02 = 1)</b>	
	Change of explanation order of each function in <b>6.4 Operations of 16-Bit Timer/Event Counter 0</b>	
	Addition of <b>Figure 6-26 PPG Output Configuration Diagram</b> and <b>Figure 6-27 PPG Output Operation Timing</b>	
	Addition of <b>6.5 Program List</b>	
	Modification of <b>6.6 (3) Capture register data retention timing</b> Addition of <b>(11) STOP mode or main system clock stop mode setting</b>	
	Modification of <b>Figure 7-1 Block Diagram of 8-Bit Timer/Event Counter 50</b> and <b>Figure 7-2 Block Diagram of 8-Bit Timer/Event Counter 51</b>	<b>CHAPTER 7 8-BIT TIMER/EVENT COUNTERS 50, 51</b>
	Deletion of <b>Caution</b> in <b>Figure 7-5 Format of 8-Bit Timer Mode Control Register 5n (TMC5n)</b>	
	Addition of <b>[Setting]</b> to <b>7.4.2 Operation as external event counter</b>	
	Addition of description about frequency to <b>[Setting]</b> in <b>7.4.3 Operation as square-wave output (8-bit resolution)</b>	
	Addition of descriptions about frequency and duty ratio to <b>7.4.4 Operation as 8-bit PWM output</b>	
	Addition of <b>7.5 Program List</b>	
	Deletion of <b>7.5 (2) Operation after compare register change during timer count operation</b> in the previous edition	
	Deletion of oscillation stabilization time select register (OSTS) from <b>9.3 Registers to Control Watchdog Timer</b> in the previous edition	<b>CHAPTER 9 WATCHDOG TIMER</b>
	Modification of <b>Figure 10-1 Block Diagram of Clock Output/Buzzer Output Controller</b>	<b>CHAPTER 10 CLOCK OUTPUT/BUZZER OUTPUT CONTROL CIRCUITS</b>
	Modification of description in <b>11.2 (3) Sample &amp; hold circuit</b> and <b>(4) Voltage comparator</b> , and addition of <b>(10) ADTRG pin</b>	<b>CHAPTER 11 8-BIT A/D CONVERTER (<math>\mu</math>PD780024AS SUBSERIES)</b>
	Addition of <b>Table 11-2 Sampling Time and A/D Conversion Start Delay Time of A/D Converter</b>	
	Deletion of <b>11.6 (4) Noise countermeasures</b> (those deleted are added to <b>Figure 11-19 Example of Connecting Capacitor to AV<sub>REF</sub> Pin</b> and <b>Figure 11-21 Example of Connection When Signal Source Impedance Is High</b> ) Addition of <b>(14) Input impedance of ANI0 to ANI3 pins</b>	
	Addition of <b>Figure 12-2 Format of A/D Conversion Result Register 0 (ADCR0)</b>	<b>CHAPTER 12 10-BIT A/D CONVERTER (<math>\mu</math>PD780034AS SUBSERIES)</b>
	Modification of description in <b>12.2 (3) Sample &amp; hold circuit</b> and <b>(4) Voltage comparator</b> , and addition of <b>(10) ADTRG pin</b>	
	Addition of <b>Table 12-2 Sampling Time and A/D Conversion Start Delay Time of A/D Converter</b>	
	Deletion of <b>12.6 (4) Noise countermeasures</b> (those deleted are added to <b>Figure 12-20 Example of Connecting Capacitor to AV<sub>REF</sub> Pin</b> and <b>Figure 12-22 Example of Connection When Signal Source Impedance Is High</b> ) Addition of <b>(14) Input impedance of ANI0 to ANI3 pins</b>	

Edition	Major Revision from Previous Edition	Applied to:
3rd	Modification of <b>Figure 13-1 Block Diagram of Serial Interface UART0</b>	<b>CHAPTER 13 SERIAL INTERFACE UART0</b>
	Shift of description about asynchronous serial interface status register 0 (ASIS0) from <b>13.3 Registers Controlling Serial Interface UART0</b> to <b>13.2 Configuration of Serial Interface UART0</b>	
	Addition of <b>Caution</b> to <b>Figure 13-7 Error Tolerance (When k = 0), Including Sampling Errors</b>	
	Modification of <b>Caution</b> in <b>Figure 13-10 Timing of Asynchronous Serial Interface Receive Completion Interrupt Request</b>	
	Addition of <b>(1) Registers to be used</b> and <b>(3) Relationship between main system clock and baud rate</b> to <b>13.4.3 Infrared data transfer mode</b>	
	Addition of <b>Table 13-6 Register Settings</b>	
3rd	Modification of <b>Figure 14-1 Block Diagram of Serial Interface SIO3n</b>	<b>CHAPTER 14 SERIAL INTERFACES SIO30 AND SIO31</b>
	Addition of <b>Notes 1 and 3</b> and <b>Caution</b> to <b>Figure 14-2 Format of Serial Operation Mode Register 30 (CSIM30)</b> and <b>Figure 14-3 Format of Serial Operation Mode Register 31 (CSIM31)</b>	
	Addition of <b>Table 14-2 Register Settings</b>	
3rd	Modification of <b>(E) Software interrupt</b> in <b>Figure 15-1 Basic Configuration of Interrupt Function</b>	<b>CHAPTER 15 INTERRUPT FUNCTIONS</b>
	Addition of <b>Caution 5</b> to <b>Figure 15-2 Format of Interrupt Request Flag Register (IF0L, IF0H, IF1L)</b>	
	Addition of <b>Caution</b> to <b>Figure 15-5 Format of External Interrupt Rising Edge Enable Register (EGP), External Interrupt Falling Edge Enable Register (EGN)</b>	
	Addition of description and <b>Remark</b> to <b>15.4.1 Non-maskable interrupt request acknowledge operation</b>	
	Addition of description to <b>15.4.2 Maskable interrupt acknowledge operation</b>	
	Addition of item to <b>Table 15-4 Interrupt Requests Enabled for Multiple Interrupts During Interrupt Servicing</b>	
3rd	Addition of clock output and buzzer output in <b>Table 16-1 HALT Mode Operating Status</b>	<b>CHAPTER 16 STANDBY FUNCTION</b>
	Modification of clock output in <b>Table 16-3 STOP Mode Operating Status</b>	
3rd	Modification of chapter	<b>CHAPTER 18</b> <b>μPD78F0034BS</b>
		<b>CHAPTER 20</b> <b>ELECTRICAL SPECIFICATIONS</b>
		<b>APPENDIX B</b> <b>DEVELOPMENT TOOLS</b>
3rd	Addition of chapter	<b>APPENDIX C NOTES ON TARGET SYSTEM DESIGN</b>
