

# P4C148, P4C149 ULTRA HIGH SPEED 1K x 4 STATIC CMOS RAMS

## FEATURES

- Full CMOS, 6T Cell
- High Speed (Equal Access and Cycle Times)
  - 10/12/15/20/25/35/45/55 ns (Commercial)
  - 15/20/25/35/45/55 ns (P4C148 Military)
- Low Power Operation
- Single 5V ± 10% Power Supply
- Two Options
  - P4C148 Low Power Standby Mode
  - P4C149 Fast Chip Select Control
- Common Input/Output Ports
- Three-State Outputs
- Fully TTL Compatible Inputs and Outputs
- Standard Pinout (JEDEC Approved)
  - 18 Pin 300 mil DIP
  - 18 Pin LCC (295 x 335 mil) [P4C148 only]
  - 18 Pin LCC (290 x 430 mil)

## DESCRIPTION

The P4C148 and P4C149 are 4,096-bit ultra high-speed static RAMs organized as 1K x 4. Both devices have common input/output ports. The P4C148 enters the standby mode when the chip enable ( $\overline{CE}$ ) goes HIGH; with CMOS input levels, power consumption is extremely low in this mode. The P4C149 features a fast chip select capability using  $\overline{CS}$ . The CMOS memories require no clocks or refreshing, and have equal access and cycle times. Inputs are fully TTL-compatible. The RAMs operate from a single 5V ± 10% tolerance power supply.

Access times as fast as 10 nanoseconds are available, permitting greatly enhanced system operating speeds.

CMOS is used to reduce power consumption when active; for the P4C148, consumption is further reduced in the standby mode.

The P4C148 and P4C149 are available in 18-pin 300 mil DIP packages, as well as 2 different LCC packages, providing excellent board level densities.

### TIMING WAVEFORM OF READ CYCLE

### TIMING WAVEFORM OF READ CYCLE NO. 2<sup>(6)</sup>

#### Notes:

- Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to MAXIMUM rating conditions for extended periods may affect reliability.
- Extended temperature operation guaranteed with 400 linear feet per minute of air flow.
- Transient inputs with  $V_L$  and  $I_L$  not more negative than  $-3.0V$  and

- $-100mA$ , respectively, are permissible for pulse widths up to 20ns.
- This parameter is sampled and not 100% tested.
- $\overline{CE}$  is LOW and  $\overline{WE}$  is HIGH for READ cycle.
- $\overline{WE}$  is HIGH, and address must be valid prior to or coincident with  $\overline{CE}$  transition LOW.
- Transition is measured  $\pm 200mV$  from steady state voltage prior to change with specified loading in Figure 1. This parameter is sampled and not 100% tested.
- Read Cycle Time is measured from the last valid address to the first transitioning address.

### TIMING WAVEFORM OF WRITE CYCLE NO. 2 ( $\overline{CE}/\overline{CS}$ CONTROLLED)<sup>(9)</sup>

**Notes:**

9.  $\overline{CE}$  and  $\overline{WE}$  must be LOW for WRITE cycle.
10. If  $\overline{CE}$  goes HIGH simultaneously with  $\overline{WE}$  high, the output remains in a high impedance state.
11. Write Cycle Time is measured from the last valid address to the first transition address.

**Note:**

Due to the ultra-high speed of the P4C148/149, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the V<sub>CC</sub> and ground planes directly up to the contactor fingers. A 0.01 μF high frequency

capacitor is also required between V<sub>CC</sub> and ground. To avoid signal reflections, proper termination must be used; for example, a 50Ω test environment should be terminated into a 50Ω load with 1.73V (Thevenin Voltage) at the comparator input, and a 116Ω resistor must be used in series with D<sub>OUT</sub> to match 166Ω (Thevenin Resistance).
