General Description

The A62S6308 is a low operating current 524,288-bit static random access memory organized as 65,536 words by 8 bits and operates on a low power supply voltage from 2.7V to 3.6V.

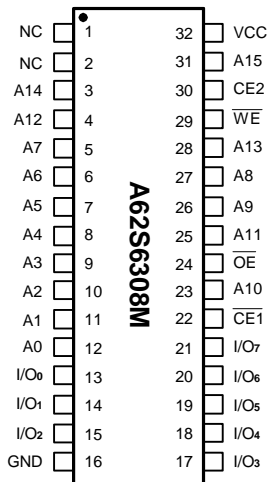

Inputs and three-state outputs are TTL compatible and allow for direct interfacing with common system bus structures.

Two chip enable inputs are provided for POWER-DOWN and a device enable and an output enable input are included for easy interfacing.

Data retention is guaranteed at a power supply voltage as low as 2V.

- Notes:
1. t_{as} is measured from the address valid to the beginning of Write.
 2. A Write occurs during the overlap (t_{wp}) of a low $\overline{CE1}$, a high CE2 and a low \overline{WE} .

 4. If the $\overline{CE1}$ low transition or the CE2 high transition occurs simultaneously with the \overline{WE} low transition or after the \overline{WE} transition, outputs remain in a high impedance state.
 5. t_{cw} is measured from the later of $\overline{CE1}$ going low or CE2 going high to the end of Write.
 6. \overline{OE} is continuously low. ($\overline{OE} = V_{IL}$)
 7. Transition is measured $\pm 500\text{mV}$ from steady state. This parameter is sampled and not 100% tested.
