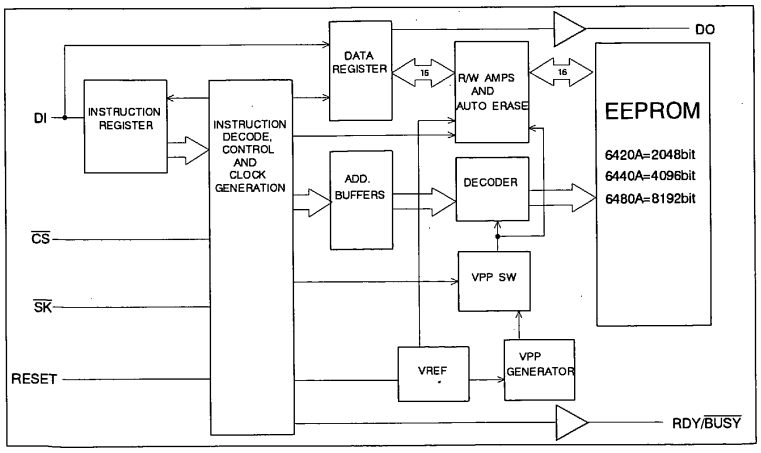
AK6420A / 40A / 80A

2K / 4K / 8Kbit Serial CMOS EEPROM

Features

- ADVANCED CMOS EEPROM TECHNOLOGY
- Wide Vcc (1.8V ~ 5.5V) operation
- AK6420A・・2048 bits: 128 × 16 organization
  AK6440A・・4096 bits: 256 × 16 organization
  AK6480A・・8192 bits: 512 × 16 organization
- ONE CHIP MICROCOMPUTER INTERFACE
  - Interface with one chip microcomputer's serial communication port directly
- LOW POWER CONSUMPTION
  - 0.75mA Max (Read operation)
  - 0.8μA Max (Standby mode)
- HIGH RELIABILITY
  -Endurance : 100K cycles
  -Data Retention : 10 years
- SPECIAL FEATURES
  - High speed operation (f_{MAX}=1MHz: Vcc=2.5V)
  - Automatic write cycle time-out with auto-ERASE
  - Automatic address increment (READ)
  - Ready/$\overline{\text{Busy}}$ status signal
  - Software and Hardware controlled write protection
- IDEAL FOR LOW DENSITY DATA STORAGE
  - Low cost, space saving, 8-pin package (SOP, SSOP)



Block diagram

General Description

The AK6420A/40A/80A is a 2048/4096/8192bit, serial, read/write, non-volatile memory device fabricated using an advanced CMOS EEPROM technology. The AK6420A has 2048bits of memory organized into 128 registers of 16 bits each. The AK6440A has 4096bits of memory organized into 256 registers of 16 bits each. The AK6480A has 8192bits of memory organized into 512 registers of 16 bits each. The AK6420A/40A/80A can operate full function under wide operating voltage range from 1.8V to 5.5V. The charge up circuit is integrated for high voltage generation that is used for write operation.

The AK6420A/40A/80A can connect to the serial communication port of popular one chip microcomputer directly (3 line negative clock synchronous interface). At write operation, AK6420A/40A/80A takes in the write data from data input pin (DI) to a register synchronously with rising edge of input pulse of serial clock pin ($\overline{SK}$). And at read operation, AK6420A/40A/80A takes out the read data from a register to data output pin (DO) synchronously with falling edge of $\overline{SK}$.

The AK6420A/40A/80A has 4 instructions such as READ, WRITE, WREN (write enable) and WRDS (write disable). Each instruction is organized by op-code block (8bits), address block (8bits) and data (8bits × 2). When input level of $\overline{SK}$ pin is high level and input level of chip select ($\overline{CS}$) pin is changed from high level to low level, AK6420A/40A/80A can receive the instructions.

Special features of the AK6420A/40A/80A include : automatic write time-out with auto-ERASE, Ready/$\overline{Busy}$ status signal output and ultra-low standby power mode when deselected ($\overline{CS}$=high).

- Software and Hardware controlled write protection

The AK6420A/40A/80A has 2 (hardware and software) write protection functions.

After power on or after execution of WRDS (write disable) instruction, execution of WRITE instruction will be disabled. This write protection condition continues until WREN instruction is executed or Vcc is removed from the part.

Execution of READ instruction is independent of both WREN and WRDS instructions.

Reset pin should be low level when WRITE instruction is executed. When the Reset pin is high level, the WRITE instruction is not executed.

- Ready/$\overline{Busy}$ status signal

During the automatic write time-out period ($\overline{BUSY}$ status), the AK6420A/40A/80A can't accept the other instructions.

The AK6420A/40A/80A has 2 functions to know the $\overline{Busy}$ status from exterior.

The RDY/$\overline{BUSY}$ pin indicates the $\overline{Busy}$ status regardless of the $\overline{CS}$ pin status. The RDY/$\overline{BUSY}$ pin outputs the low level regardless of the $\overline{CS}$ pin status during $\overline{Busy}$ status. Except the above status, this pin outputs high level.

Also the DO pin indicates the $\overline{Busy}$ status. When input level of $\overline{SK}$ pin is low level and input level of $\overline{CS}$ pin is changed from high level to low level, the AK6420A/40A/80A is in the status output mode and the DO pin indicates the Ready/$\overline{Busy}$ status. The Ready/$\overline{Busy}$ status outputs on DO pin until $\overline{CS}$ pin is changed from low level to high level, or first bit ("1") of op-code of next instruction is given to the part. Except when the device is in the status output mode or outputs data, the DO pin is in the high impedance state.

■ Type of Products

Model	Memory size	Temp.Range	Vcc	Package
AK6420AF	2Kbits	-40°C~85°C	1.8V ~ 5.5V	8pin Plastic SOP
AK6420AM		-40°C~85°C	1.8V ~ 5.5V	8pin Plastic SSOP
AK6440AF	4Kbits	-40°C~85°C	1.8V ~ 5.5V	8pin Plastic SOP
AK6440AM		-40°C~85°C	1.8V ~ 5.5V	8pin Plastic SSOP

Note

I : Input pin

O: Output pin

■ Pin Description

$\overline{\text{CS}}$ (Chip Select)
When $\overline{\text{SK}}$ is high level and $\overline{\text{CS}}$ is changed from high level to low level, AK6420A/40A/80A can receive the instructions. $\overline{\text{CS}}$ should be kept low level while receiving op-code, address and data and while outputting data. If $\overline{\text{CS}}$ is changed to high level during the above period, AK6420A/40A/80A stops the instruction execution. When $\overline{\text{SK}}$ is low and $\overline{\text{CS}}$ is changed from high level to low level, AK6420A/40A/80A will be in status output mode. The $\overline{\text{CS}}$ need not be low level during the automatic write time-out period ($\overline{\text{BUSY}}$ status).

$\overline{\text{SK}}$ (Serial Clock)
The $\overline{\text{SK}}$ clock pin is the synchronous clock input for input/output data. At write operation, AK6420A/40A/80A takes in the write data from data input pin (DI) synchronously with rising edge of input pulse of serial clock pin ($\overline{\text{SK}}$). And at read operation, AK6420A/40A/80A takes out the read data to data output pin (DO) synchronously with falling edge of $\overline{\text{SK}}$. The $\overline{\text{SK}}$ clock is not needed during the automatic write time-out period ($\overline{\text{BUSY}}$ status), the status output period and when the device isn't selected ($\overline{\text{CS}}$ = high level).

DI (Data Input)
The op-code, address and write data is input to the DI pin.

DO (Data Output)
The DO pin outputs the read data and status signal and will be high impedance except for this timing.

RDY/$\overline{\text{BUSY}}$ (Ready/$\overline{\text{Busy}}$ status)
This pin outputs the internal programming status. When the AK6420A/40A/80A is in the automatic write time-out period, this pin outputs the low level ($\overline{\text{BUSY}}$ status), and outputs the high level except for this timing.

RESET (Reset)
The AK6420A/40A/80A stops executing the write instruction when the RESET pin is high level. The RESET pin should be low level while the write instruction input period and the automatic write time-out period. If the RESET pin is high level while the automatic write time-out period, the AK6420A/40A/80A stops execution of internal programming and the device returns to ready status. In this case the word data of the specified address will be incomplete. When inputting the new instruction after RESET, the $\overline{\text{CS}}$ should be set to high level. The read, write enable and write disable instructions are not affected by RESET pin status.

Vcc (Power Supply)

GND (Ground)

Functional Description

The AK6420A/40A/80A has 4 instructions such as READ, WRITE, WREN (write enable) and WRDS (write disable). Each instruction is organized by op-code block (8bits), address block (8bits) and data (8bits × 2). When input level of $\overline{SK}$ pin is high level and input level of chip select ($\overline{CS}$) pin is changed from high level to low level, AK6420A/40A/80A can receive the instructions.
When the instructions are executed consecutively, the $\overline{CS}$ pin should be brought to high level for a minimum of 250ns(Tcs) between consecutive instruction cycle.

■ Instruction Set For 6420A

Instruction	Op-Code	Address	Data
READ	1 0 1 0 1 0 0 0	A6 A5 A4 A3 A2 A1 A0 0	D15 -D0
WRITE	1 0 1 0 0 1 0 0	A6 A5 A4 A3 A2 A1 A0 0	D15 -D0
WREN	1 0 1 0 0 0 1 1	× × × × × × × ×	
WRDS	1 0 1 0 0 0 0 0	× × × × × × × ×	
(WRAL)	1 0 1 0 1 1 1 1	× × × × × × × ×	D15 -D0

■ Instruction Set For 6440A

Instruction	Op-Code	Address	Data
READ	1 0 1 0 1 0 0 0	A7 A6 A5 A4 A3 A2 A1 A0	D15 -D0
WRITE	1 0 1 0 0 1 0 0	A7 A6 A5 A4 A3 A2 A1 A0	D15 -D0
WREN	1 0 1 0 0 0 1 1	× × × × × × × ×	
WRDS	1 0 1 0 0 0 0 0	× × × × × × × ×	
(WRAL)	1 0 1 0 1 1 1 1	× × × × × × × ×	D15 -D0

■ Instruction Set For 6480A

Instruction	Op-Code	Address	Data
READ	1 0 1 0 1 0 0 A8	A7 A6 A5 A4 A3 A2 A1 A0	D15 -D0
WRITE	1 0 1 0 0 1 0 A8	A7 A6 A5 A4 A3 A2 A1 A0	D15 -D0
WREN	1 0 1 0 0 0 1 1	× × × × × × × ×	
WRDS	1 0 1 0 0 0 0 0	× × × × × × × ×	
(WRAL)	1 0 1 0 1 1 1 1	× × × × × × × ×	D15 -D0

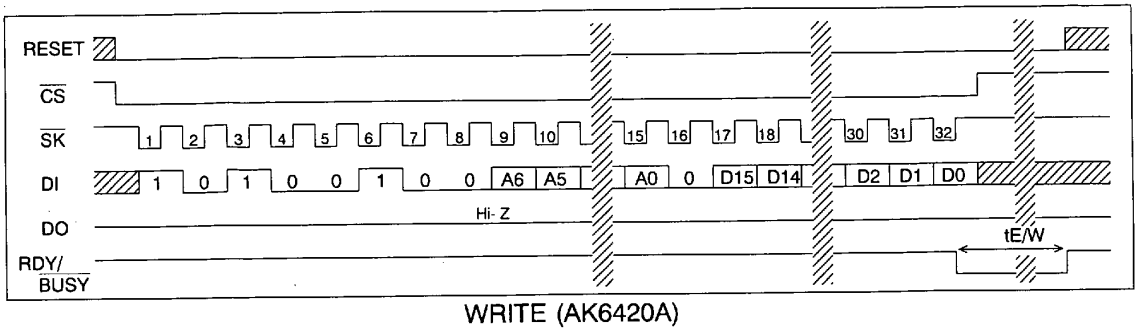
×:don't care

(Note) The WRAL instruction is used for factory function test only. User can't use this instruction .

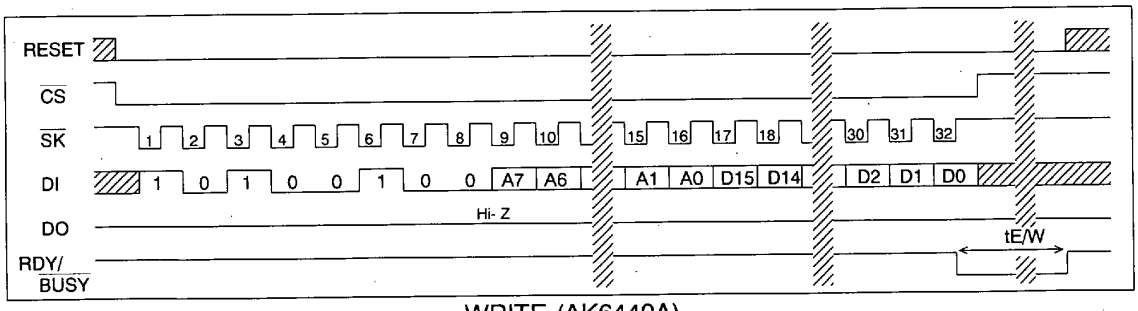
Write

The write instruction is followed by 16 bits of data to be written into the specified address. After the 32nd rising edge of $\overline{SK}$ to read D0 in, the AK6420A/40A/80A will be put into the automatic write time-out period. During the automatic write time-out period ($\overline{Busy}$ status)and while entering write instruction, the RESET pin should be low level. If the RESET pin is set to high level during the automatic write time-out period, the AK6420A/40A/80A stops execution of internal programming and the device returns to ready status. In this case the word data of the specified address will be incomplete. When inputting the new instruction after RESET, the $\overline{CS}$ should be set to high level. When the RESET pin is kept at high level, the write is not executed. This becomes write protection function.

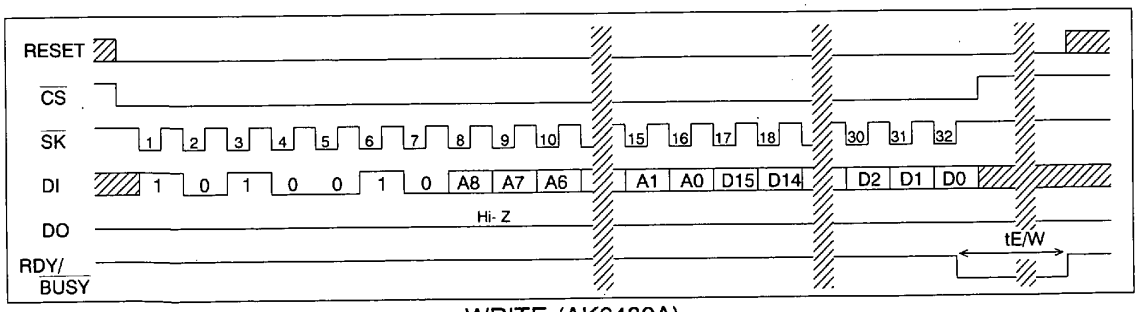
The $\overline{CS}$ pin need not be high level during automatic write time-out period ($\overline{BUSY}$ status).



WRITE (AK6420A)



WRITE (AK6440A)



WRITE (AK6480A)

Read

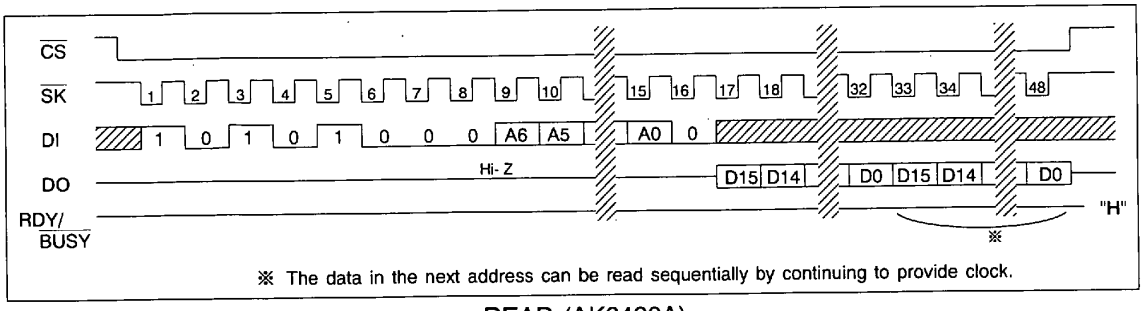
The read instruction is the only instruction which outputs serial data on the DO pin. When the 17th falling edge of $\overline{SK}$ is received , the DO pin will come out of high impedance state and shift out the data from D15 first in descending order which is located at the address specified in the instruction.

The data in the next address can be read sequentially by continuing to provide clock. The address automatically cycles to the next higher address after the 16bit data shifted out.

AK6420A・・ When the highest address is reached ($7F), the address counter rolls over to address $00 allowing the read cycle to be continued indefinitely.

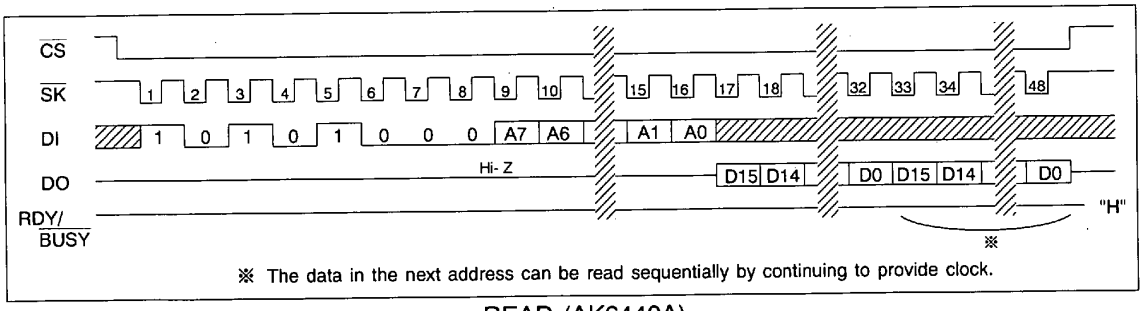
AK6440A・・ When the highest address is reached ($FF), the address counter rolls over to address $00 allowing the read cycle to be continued indefinitely.

AK6480A・・ When the highest address is reached ($1FF), the address counter rolls over to address $000 allowing the read cycle to be continued indefinitely.



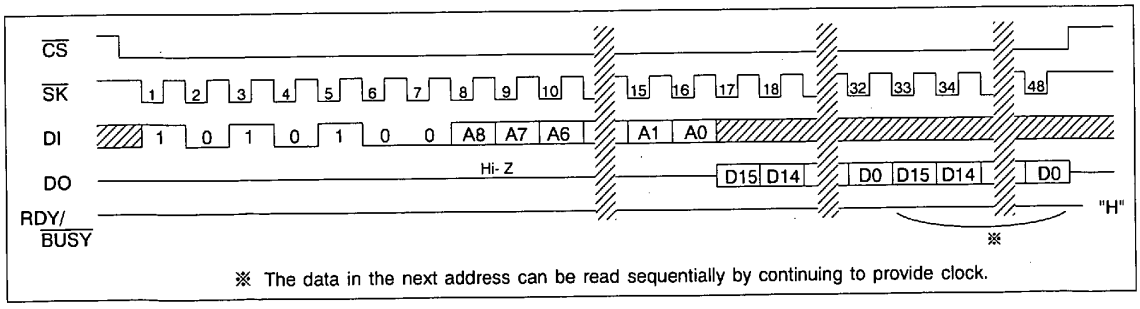
※ The data in the next address can be read sequentially by continuing to provide clock.

READ (AK6420A)



※ The data in the next address can be read sequentially by continuing to provide clock.

READ (AK6440A)

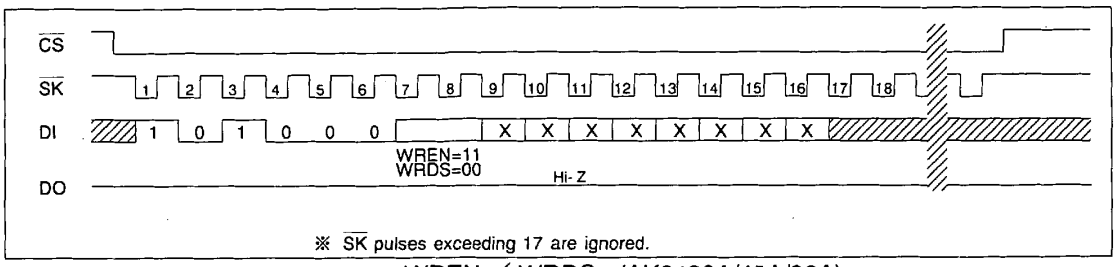


※ The data in the next address can be read sequentially by continuing to provide clock.

READ (AK6480A)

WREN / WRDS (Write Enable and Write Disable)

When Vcc is applied to the part, it powers up in the programming disable (WRDS) state. Programming must be preceded by a programming enable (WREN) instruction. Programming remains enabled until a programming disable (WRDS) instruction is executed or Vcc is removed from the part. The programming disable instruction is provided to protect against accidental data disturb. Execution of a read instruction is not affected by both WREN and WRDS instructions.



WREN ／ WRDS (AK6420A/40A/80A)

Absolute Maximum Ratings

Parameter	Symbol	Min	Max	Unit
Power Supply	VCC	-0.6	+7.0	V
All Input Voltages with Respect to Ground	VIO	-0.6	VCC+0.6	V
Ambient storage temperature	Tst	-65	+150	°C

Stress above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum conditions for extended periods may affect device reliability.

Recommended Operating Condition

IMPORTANT NOTICE

- These products and their specifications are subject to change without notice. Before considering any use or application, consult the Asahi Kasei Microsystems Co., Ltd. (AKM) sales office or authorized distributor concerning their current status.
- AKM assumes no liability for infringement of any patent, intellectual property, or other right in the application or use of any information contained herein.
- Any export of these products, or devices or systems containing them, may require an export license or other official approval under the law and regulations of the country of export pertaining to customs and tariffs, currency exchange, or strategic materials.
- AKM products are neither intended nor authorized for use as critical components in any safety, life support, or other hazard related device or system, and AKM assumes no responsibility relating to any such use, except with the express written consent of the Representative Director of AKM. As used here:
  (a) A hazard related device or system is one designed or intended for life support or maintenance of safety or for applications in medicine, aerospace, nuclear energy, or other fields, in which its failure to function or perform may reasonably be expected to result in loss of life or in significant injury or damage to person or property.
  (b) A critical component is one whose failure to function or perform may reasonably be expected to result, whether directly or indirectly, in the loss of the safety or effectiveness of the device or system containing it, and which must therefore meet very high standards of performance and reliability.
- It is the responsibility of the buyer or distributor of an AKM product who distributes, disposes of, or otherwise places the product with a third party to notify that party in advance of the above content and conditions, and the buyer or distributor agrees to assume any and all responsibility and liability for and hold AKM harmless from any and all claims arising from the use of said product in the absence of such notification.
