
HN29W25611S Series

256M AND type Flash Memory
More than 16,057-sector (271,299,072-bit)

HITACHI

ADE-203-1233B (Z)

Rev. 2.0

Mar. 8, 2001

Description

The Hitachi HN29W25611S Series is CMOS Flash Memory with AND type memory cells. It has fully automatic programming and erase capabilities with a single 3.3 V power supply. The functions are controlled by simple external commands. To fit the I/O card applications, the unit of programming and erase is as small as (2048 + 64) bytes. Initial available sectors of HN29W25611S are more than 16,057 (98% of all sector address).

Features

- On-board single power supply (V_{CC}): $V_{CC} = 2.7\text{ V to }3.6\text{ V}$
- Organization
 - AND Flash Memory: (2048 + 64) bytes \times (More than 16,057 sectors)
 - Data register: (2048 + 64) bytes
- Multi-level memory cell
 - 2 bit/per memory cell
- Automatic programming
 - Sector program time: 3.0 ms (typ)
 - System bus free
 - Address, data latch function
 - Internal automatic program verify function
 - Status data polling function
- Automatic erase
 - Single sector erase time: 1.5 ms (typ)
 - System bus free
 - Internal automatic erase verify function
 - Status data polling function

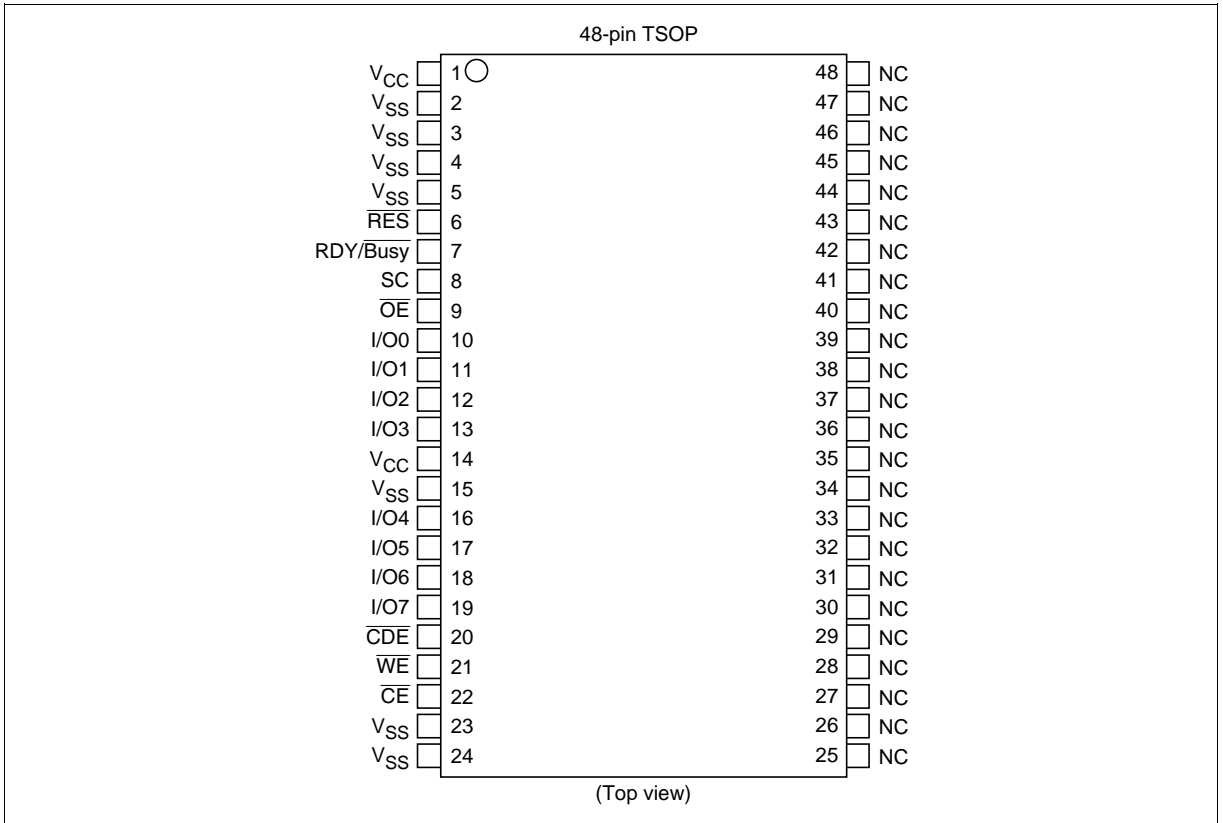

HN29W25611S Series

- Erase mode
 - Single sector erase ((2048 + 64) byte unit)
- Fast serial read access time:
 - First access time: 50 μ s (max)
 - Serial access time : 80 ns (max) ($V_{CC} = 2.7$ V to 3.6 V)
: 60 ns (max) ($V_{CC} = 3.0$ V to 3.6 V)
- Low power dissipation:
 - $I_{CC2} = 50$ mA (max) (Read)
 - $I_{SB2} = 50$ μ A (max) (Standby)
 - $I_{CC3}/I_{CC4} = 40$ mA (max) (Erase/Program)
 - $I_{SB3} = 5$ μ A (max) (Deep standby)
- The following architecture is required for data reliability.
 - Error correction: more than 3-bit error correction per each sector read
 - Spare sectors: 1.8% (290 sectors)/chip within usable sectors

Ordering Information

Type No.	Available sector	Package
HN29W25611ST-80	More than 16,057 sectors	12.0 \times 18.40 mm ² 0.5 mm pitch 48-pin plastic TSOP I (TFP-48D)

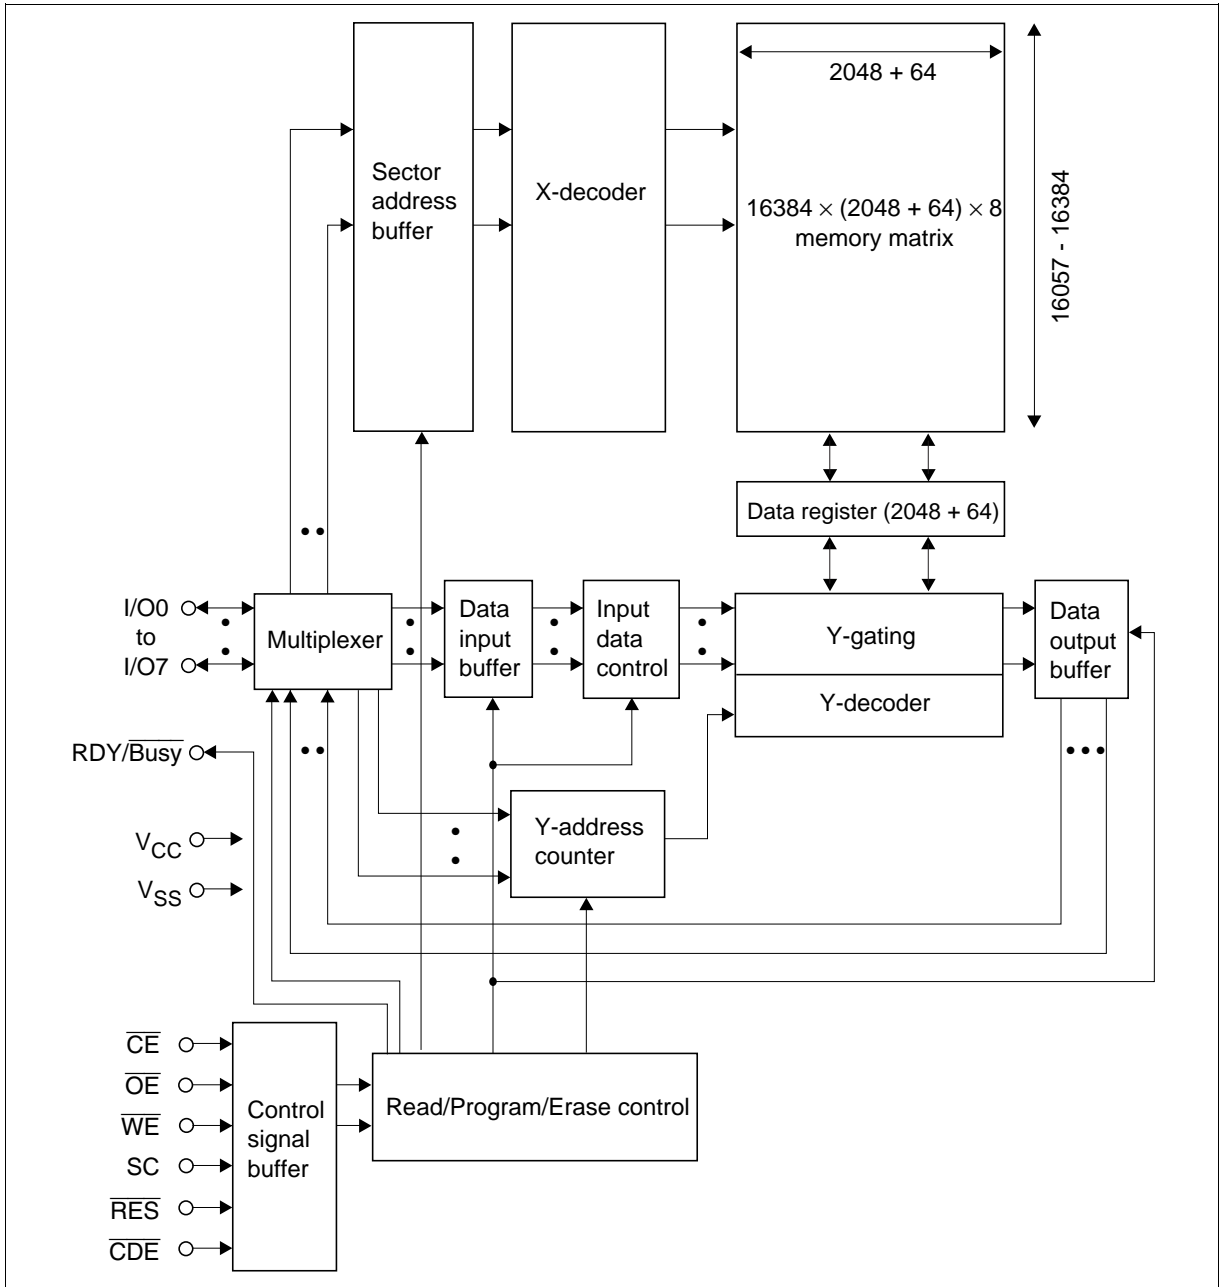

Pin Arrangement

Pin Description

Pin name	Function
I/O0 to I/O7	Input/output
CE	Chip enable
OE	Output enable
WE	Write enable
CDE	Command data enable
V _{cc}	Power supply
V _{ss}	Ground
RDY/Busy	Ready/Busy
RES	Reset
SC	Serial clock
NC	No connection

Block Diagram

Memory Map and Address

Address	Cycles	I/O0	I/O1	I/O2	I/O3	I/O4	I/O5	I/O6	I/O7
Sector address	SA (1): First cycle	A0	A1	A2	A3	A4	A5	A6	A7
	SA (2): Second cycle	A8	A9	A10	A11	A12	A13	×*2	×
Column address	CA (1): First cycle	A0	A1	A2	A3	A4	A5	A6	A7
	CA (2): Second cycle	A8	A9	A10	A11	×	×	×	×

- Notes: 1. Some failed sectors may exist in the device. The failed sectors can be recognized by reading the sector valid data written in a part of the column address 800 to 83F (The specific address is TBD.). The sector valid data must be read and kept outside of the sector before the sector erase. When the sector is programmed, the sector valid data should be written back to the sector.
2. An × means "Don't care". The pin level can be set to either V_{IL} or V_{IH} , referred to DC characteristics.

Pin Function

\overline{CE} : \overline{CE} is used to select the device. The status returns to the standby at the rising edge of \overline{CE} in the reading operation. However, the status does not return to the standby at the rising edge of \overline{CE} in the busy state in programming and erase operation.

\overline{OE} : Memory data and status register data can be read, when \overline{OE} is V_{IL} .

\overline{WE} : Commands and address are latched at the rising edge of \overline{WE} .

SC: Programming and reading data is latched at the rising edge of SC.

\overline{RES} : \overline{RES} pin must be kept at the V_{ILR} ($V_{SS} \pm 0.2$ V) level when V_{CC} is turned on and off. In this way, data in the memory is protected against unintentional erase and programming. \overline{RES} must be kept at the V_{IHR} ($V_{CC} \pm 0.2$ V) level during any operations such as programming, erase and read.

\overline{CDE} : Commands and data are latched when \overline{CDE} is V_{IL} and address is latched when \overline{CDE} is V_{IH} .

RDY/ \overline{Busy} : The RDY/ \overline{Busy} indicates the program/erase status of the flash memory. The RDY/ \overline{Busy} signal is initially at a high impedance state. It turns to a V_{OL} level after the (40H) command in programming operation or the (B0H) command in erase operation. After the erase or programming operation finishes, the RDY/ \overline{Busy} signal turns back to the high impedance state.

I/O0 to I/O7: The I/O pins are used to input data, address and command, and are used to output memory data and status register data.

Mode Selection

Mode	\overline{CE}	\overline{OE}	\overline{WE}	SC	\overline{RES}	\overline{CDE}	RDY/ \overline{Busy} ^{*3}	I/O0 to I/O7
Deep standby	\times ^{*4}	\times	\times	\times	V_{ILR}	\times	V_{OH}	High-Z
Standby	V_{IH}	\times	\times	\times	V_{IHR}	\times	V_{OH}	High-Z
Output disable	V_{IL}	V_{IH}	V_{IH}	\times	V_{IHR}	\times	V_{OH}	High-Z
Status register read ^{*1}	V_{IL}	V_{IL}	V_{IH}	\times	V_{IHR}	\times	V_{OH}	Status register outputs
Command write ^{*2}	V_{IL}	V_{IH}	V_{IL}	V_{IL}	V_{IHR}	V_{IL}	V_{OH}	Din

- Notes: 1. Default mode after the power on is the status register read mode (refer to status transition). From I/O0 to I/O7 pins output the status, when $\overline{CE} = V_{IL}$ and $\overline{OE} = V_{IL}$ (conventional read operation condition).
2. Refer to the command definition. Data can be read, programmed and erased after commands are written in this mode.
3. The RDY/ \overline{Busy} bus should be pulled up to V_{CC} to maintain the V_{OH} level while the RDY/ \overline{Busy} pin outputs a high impedance.
4. An \times means "Don't care". The pin level can be set to either V_{IL} or V_{IH} referred to DC characteristics.

Reset		1				
Clear status register		1				

- Notes:
1. Commands and sector address are latched at rising edge of \overline{WE} pulses. Program data is latched at rising edge of SC pulses.
 2. The chip is in the read status register mode when \overline{RES} is set to V_{IHR} first time after the power up.
 3. Refer to the command read and write mode in mode selection.
 4. SA (1) = Sector address (A0 to A7), SA (2) = Sector address (A8 to A13).
 5. CA (1) = Column address (A0 to A7), CA (2) = Column address (A8 to A11).
(0 A11 to A0 83FH)
 6. The variable h is the input number of times of set of CA (1) and CA (2) (1 h 2048 + 64).
Set of CA (1) and CA (2) can be input without limitation.
 7. By using program (1) and (3), data can additionally be programmed for each sector before erase.
 8. ID = Identifier code; Manufacturer code (07H), Device code (99H).
 9. The manufacturer identifier code is output when \overline{CDE} is low and the device identifier code is output when \overline{CDE} is high.
 10. Before program (2) operations, data in the programmed sector must be erased.
 11. No commands can be written during auto program and erase (when the RDY/Busy pin outputs a V_{OL}).
 12. The fourth or sixth cycle of the auto program comes after the program data input is complete.

Mode Description

Read

Serial Read (1): Memory data D0 to D2111 in the sector of address SA is sequentially read. Output data is not valid after the number of the SC pulse exceeds 2112. When CA is input, memory data D (m) to D (m + j) in the sector of address SA is sequentially read. Then output data is not valid after the number of the SC pulse exceeds (2112 to m). The mode turns back to the standby mode at any time when \overline{CE} is V_{IH} .

Serial Read (2): Memory data D2048 to D2111 in the sector of address SA is sequentially read. Output data is not valid after the number of the SC pulse exceeds 64. The mode turns back to the standby mode at any time when \overline{CE} is V_{IH} .

Automatic Erase

Single Sector Erase: Memory data D0 to D2111 in the sector of address SA is erased automatically by internal control circuits. After the sector erase starts, the erasure completion can be checked through the RDY/\overline{Busy} signal and status data polling. All the bits in the sector are "1" after the erase. The sector valid data stored in a part of memory data D2048 to D2111 must be read and kept outside of the sector before the sector erase.

Automatic Program

Program (1): Program data PD0 to PD2111 is programmed into the sector of address SA automatically by internal control circuits. When CA is input, program data PD (m) to PD (m + j) is programmed from CA into the sector of address SA automatically by internal control circuits. By using program (1), data can additionally be programmed for each sector before the following erase. When the column is programmed, the data of the column must be [FF]. After the programming starts, the program completion can be checked through the RDY/\overline{Busy} signal and status data polling. Programmed bits in the sector turn from "1" to "0" when they are programmed. The sector valid data should be included in the program data PD2048 to PD2111.

Program (2): Program data PD0 to PD2111 is programmed into the sector of address SA automatically by internal control circuits. After the programming starts, the program completion can be checked through the RDY/\overline{Busy} signal and status data polling. Programmed bits in the sector turn from "1" to "0" when they are programmed. The sector must be erased before programming. The sector valid data should be included in the program data PD2048 to PD2111.

Program (3): Program data PD2048 to PD2111 is programmed into the sector of address SA automatically by internal control circuits. By using program (3), data can additionally be programmed for each sector before the following erase. When the column is programmed, the data of the column must be [FF]. After the programming starts, the program completion can be checked through the RDY/\overline{Busy} signal and status data polling. Programmed bits in the sector turn from "1" to "0" when they are programmed.

Program (4): Program data PD0 to PD2111 is programmed into the sector of address SA automatically by internal control circuits. When CA is input, program data PD (m) to PD (m + j) is programmed from CA into the sector of address SA automatically by internal control circuits. By using program (4), data can be rewritten for each sector before the following erase. So the column data before programming operation are either "1" or "0". In this mode, E/W number of times must be counted whenever program (4) execute. After the programming starts, the program completion can be checked through the RDY/Busy signal and status data polling. The sector valid data should be included in the program data PD2048 to PD2111.

Status Register Read

The status returns to the status register read mode from standby mode, when \overline{CE} and \overline{OE} is V_{IL} . In the status register read mode, I/O pins output the same operation status as in the status data polling defined in the function description.

Identifier Read

The manufacturer and device identifier code can be read in the identifier read mode. The manufacturer and device identifier code is selected with $\overline{CDE} V_{IL}$ and V_{IH} , respectively.

Data Recovery Read

When the programming was an error, the program data can be read by using data recovery read. When an additional programming was an error, the data compounded of the program data and the origin data in the sector address SA can be read. Output data are not valid after the number of SA pulse exceeds 2112. The mode turns back to the standby mode at any time when \overline{CE} is V_{IH} . The read data are invalid when addresses are latched at a rising edge of \overline{WE} pulse after the data recovery read command is written.

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit	Notes
V_{CC} voltage	V_{CC}	-0.6 to +4.5	V	1
V_{SS} voltage	V_{SS}	0	V	
All input and output voltages	V_{in} , V_{out}	-0.6 to $V_{CC} + 0.3$	V	1, 2
Operating temperature range	T_{opr}	0 to +70	°C	
Storage temperature range	T_{stg}	-65 to +125	°C	3
Storage temperature under bias	T_{bias}	-10 to +80	°C	

Notes: 1. Relative to V_{SS} .

2. V_{in} , V_{out} = -2.0 V for pulse width 20 ns.

3. Device storage temperature range before programming.

Capacitance ($T_a = 25^\circ\text{C}$, $f = 1\text{ MHz}$)

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Input capacitance	C_{in}	—	—	6	pF	$V_{in} = 0\text{ V}$
Output capacitance	C_{out}	—	—	12	pF	$V_{out} = 0\text{ V}$

DC Characteristics ($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $T_a = 0\text{ to }+70^\circ\text{C}$)

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Input leakage current	I_{LI}	—	—	2	μA	$V_{in} = V_{SS}\text{ to }V_{CC}$
Output leakage current	I_{LO}	—	—	2	μA	$V_{out} = V_{SS}\text{ to }V_{CC}$
Standby V_{CC} current	I_{SB1}	—	0.3	1	mA	$\overline{CE} = V_{IH}$
	I_{SB2}	—	30	50	μA	$\overline{CE} = V_{CC} \pm 0.2\text{ V}$, $\overline{RES} = V_{CC} \pm 0.2\text{ V}$
Deep standby V_{CC} current	I_{SB3}	—	1	5	μA	$\overline{RES} = V_{SS} \pm 0.2\text{ V}$
Operating V_{CC} current	I_{CC1}	—	20	25	mA	$I_{out} = 0\text{ mA}$, $f = 0.2\text{ MHz}$
	I_{CC2}	—	30	50	mA	$I_{out} = 0\text{ mA}$, $f = 20\text{ MHz}$
Operating V_{CC} current (Program)	I_{CC3}	—	20	40	mA	In programming
Operating V_{CC} current (Erase)	I_{CC4}	—	20	40	mA	In erase
Input voltage	V_{IL}	$-0.3^{*1,2}$	—	$V_{CC} \times 0.3$	V	
	V_{IH}	$V_{CC} \times 0.7$	—	$V_{CC} + 0.3^{*3}$	V	
Input voltage (\overline{RES} pin)	V_{ILR}	-0.2	—	0.2	V	
	V_{IHR}	$V_{CC} - 0.2$	—	$V_{CC} + 0.2$	V	
Output voltage	V_{OL}	—	—	0.4	V	$I_{OL} = 2\text{ mA}$
	V_{OH}	$V_{CC} \times 0.8$	—	—	V	$I_{OH} = -2\text{ mA}$
	V_{OH}	2.4	—	—	V	$I_{OH} = -2\text{ mA}$

Notes: 1. V_{IL} min = -1.0 V for pulse width 50 ns in the read operation. V_{IL} min = -2.0 V for pulse width 20 ns in the read operation.

2. V_{IL} min = -0.6 V for pulse width 20 ns in the erase/data programming operation.

3. V_{IH} max = $V_{CC} + 1.5\text{ V}$ for pulse width 20 ns. If V_{IH} is over the specified maximum value, the operations are not guaranteed.

AC Characteristics ($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $T_a = 0\text{ to }+70^\circ\text{C}$)

Test Conditions

- Input pulse levels: 0.7 V/2.7 V
- Input pulse levels for \overline{RES} : 0.2 V/ $V_{CC} - 0.2\text{ V}$
- Input rise and fall time: 5 ns
- Output load: 1 TTL gate + 100 pF (Including scope and jig.)
- Reference levels for measuring timing: 0.8 V, 1.8 V

Timing Waveforms

Power on and off Sequence

Program (1) and Status Data Polling Timing Waveform

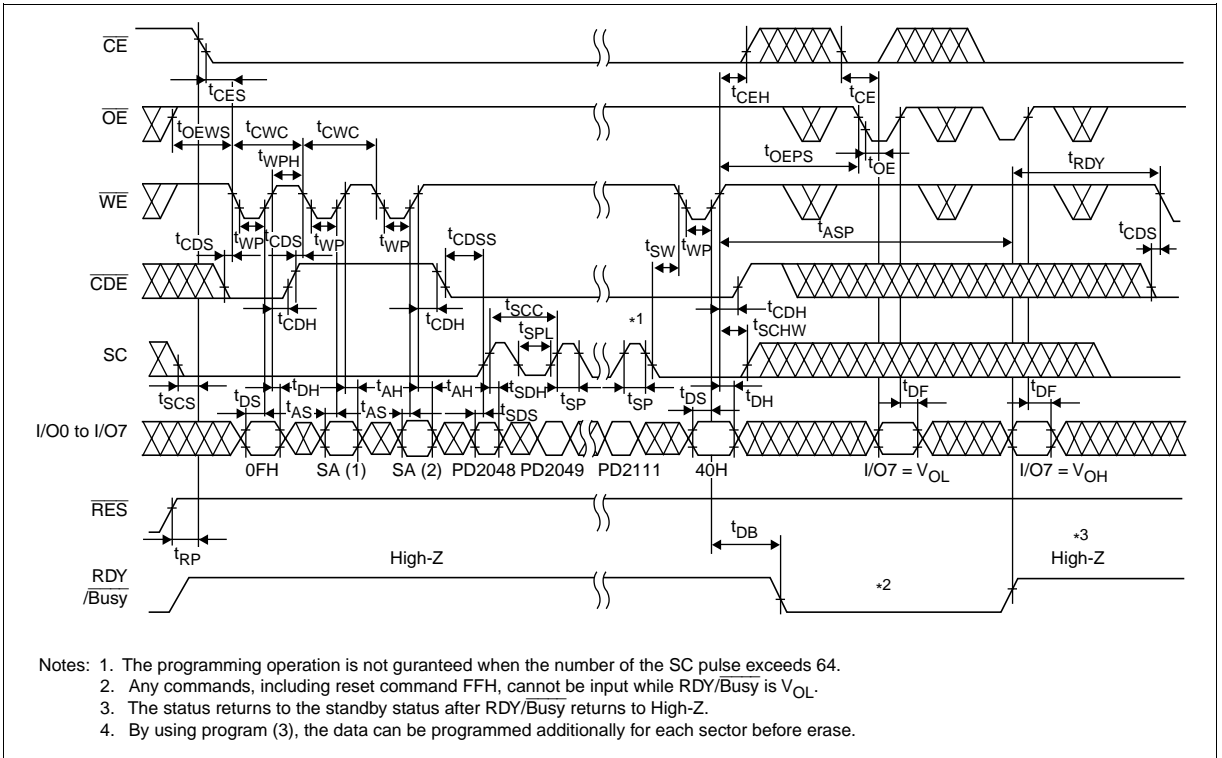

Program (1) with CA before SC and Status Data Polling Timing Waveform

Program (1) with CA after SC and Status Data Polling Timing Waveform

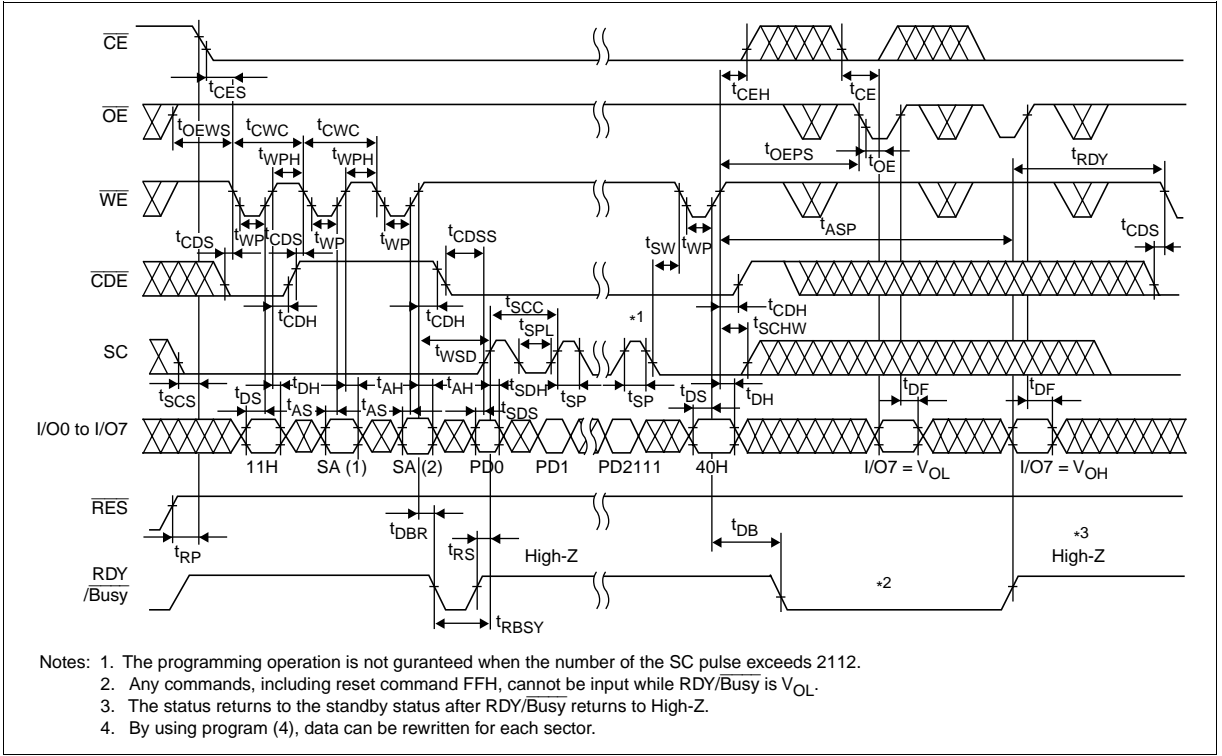

Program (3) and Status Data Polling Timing Waveform

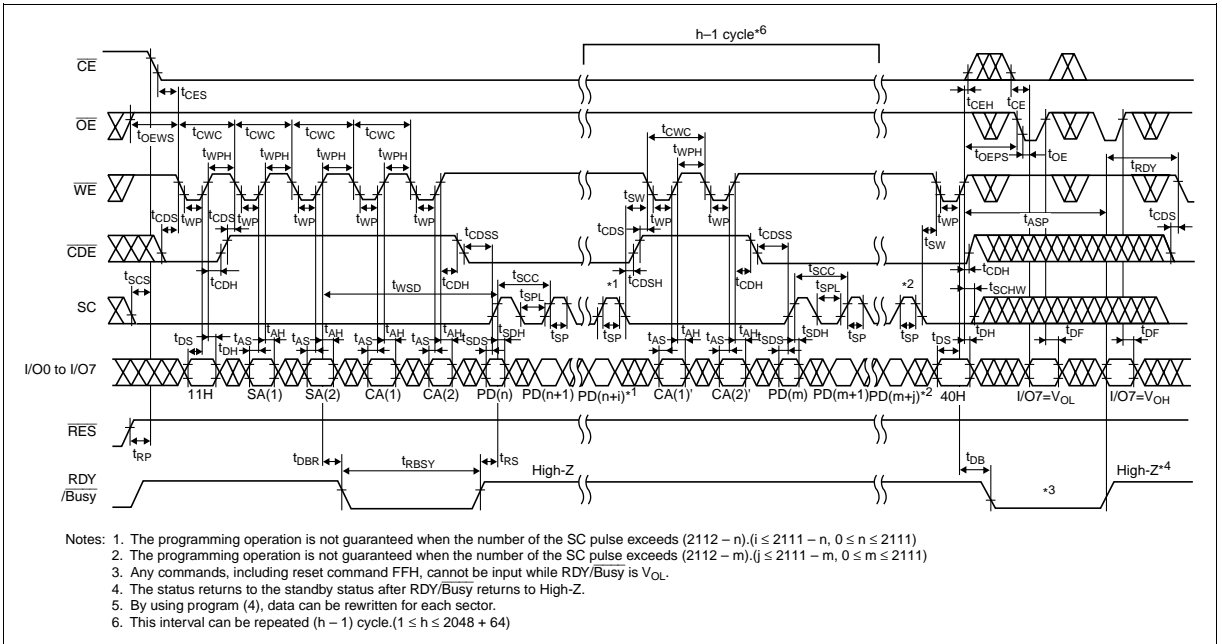

- Notes: 1. The programming operation is not guaranteed when the number of the SC pulse exceeds 64.
- 2. Any commands, including reset command FFH, cannot be input while RDY/Busy is V_{OL} .
- 3. The status returns to the standby status after RDY/Busy returns to High-Z.
- 4. By using program (3), the data can be programmed additionally for each sector before erase.

Program (4) and Status Data Polling Timing Waveform

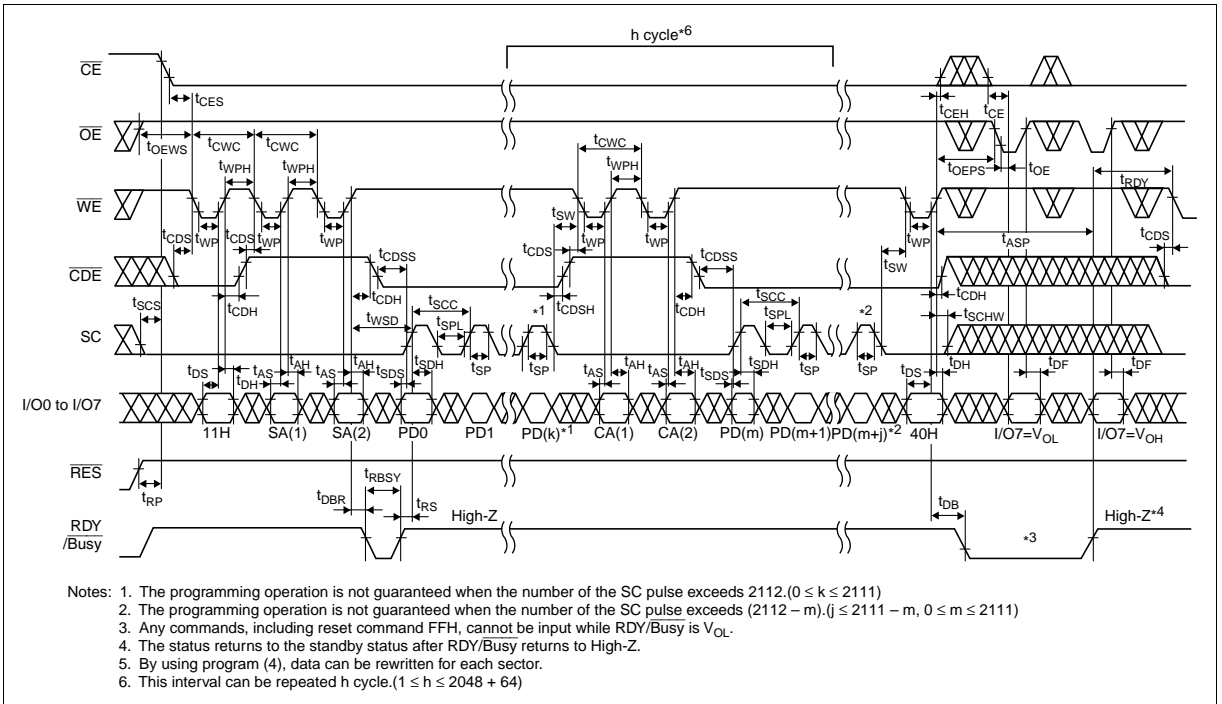

- Notes: 1. The programming operation is not guaranteed when the number of the SC pulse exceeds 2112.
- 2. Any commands, including reset command FFH, cannot be input while RDY/Busy is V_{OL} .
- 3. The status returns to the standby status after RDY/Busy returns to High-Z.
- 4. By using program (4), data can be rewritten for each sector.

Program (4) with CA after SC and Status Data Polling Timing Waveform

ID and Status Register Read Timing Waveform

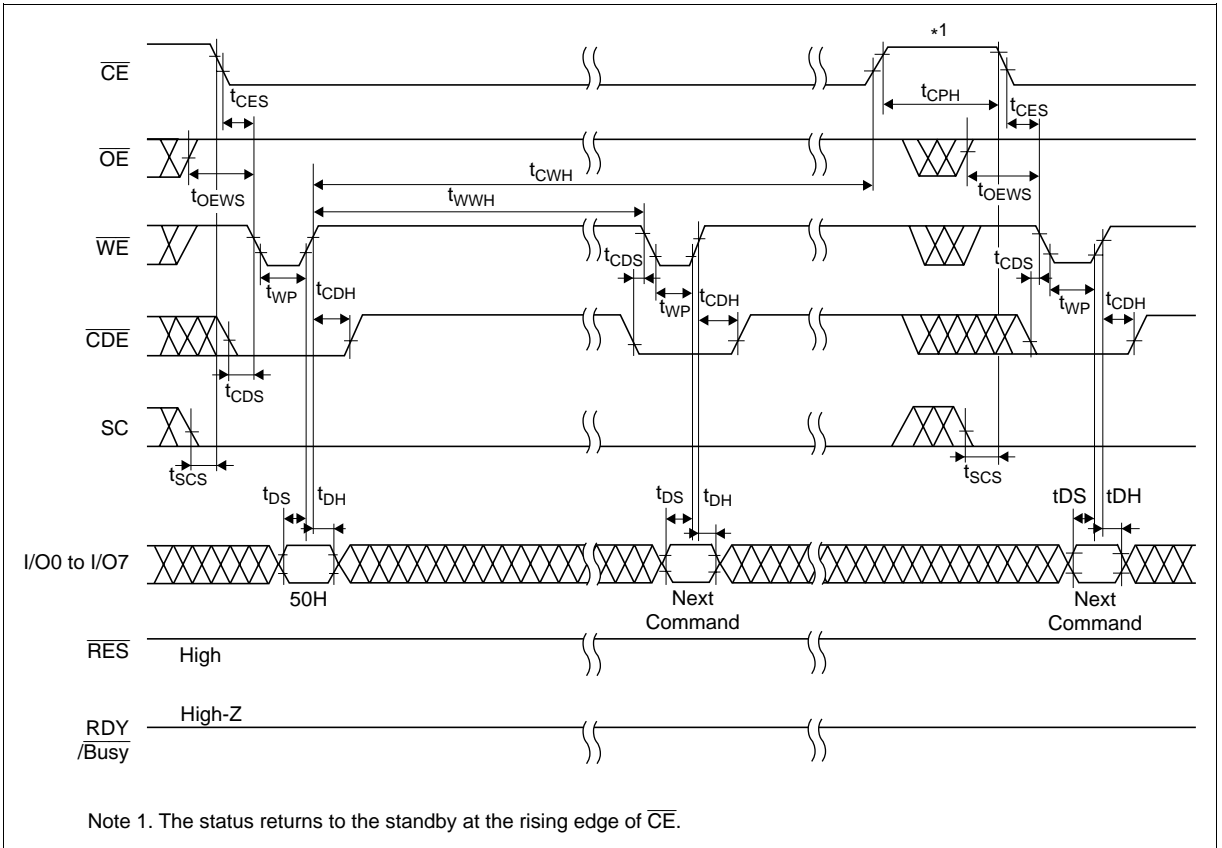

Data Recovery Read Timing Waveform

HN29W25611S Series

Clear Status Register Timing Waveform

Function Description

Status Register: The HN29W25611S outputs the operation status data as follows: I/O7 pin outputs a V_{OL} to indicate that the memory is in either erase or program operation. The level of I/O7 pin turns to a V_{OH} when the operation finishes. I/O5 and I/O4 pins output V_{OLS} to indicate that the erase and program operations complete in a finite time, respectively. If these pins output V_{OHS} , it indicates that these operations have timed out. When these pins monitor, I/O7 pin must turn to a V_{OH} . To execute other erase and program operation, the status data must be cleared after a time out occurs. From I/O0 to I/O3 pins are reserved for future use. The pins output V_{OLS} and should be masked out during the status data read mode. The function of the status register is summarized in the following table.

I/O	Flag definition	Definition
I/O7	Ready/ $\overline{\text{Busy}}$	V_{OH} = Ready, V_{OL} = Busy
I/O6	Reserved	Outputs a V_{OL} and should be masked out during the status data polling mode.
I/O5	Erase check	V_{OH} = Fail, V_{OL} = Pass
I/O4	Program check	V_{OH} = Fail, V_{OL} = Pass
I/O3	Reserved	Outputs a V_{OL} and should be masked out during the status data polling mode.
I/O2	Reserved	
I/O1	Reserved	
I/O0	Reserved	

Requirement for System

Specifications

Item	Min	Typ	Max	Unit
Usable sectors (initially)	16,057	—	16,384	sector
Spare sectors	290	—	—	sector
ECC (Error Correction Code)	3	—	—	bit/sector
Program/Erase endurance	—	—	3×10^5	cycle

Unusable Sector

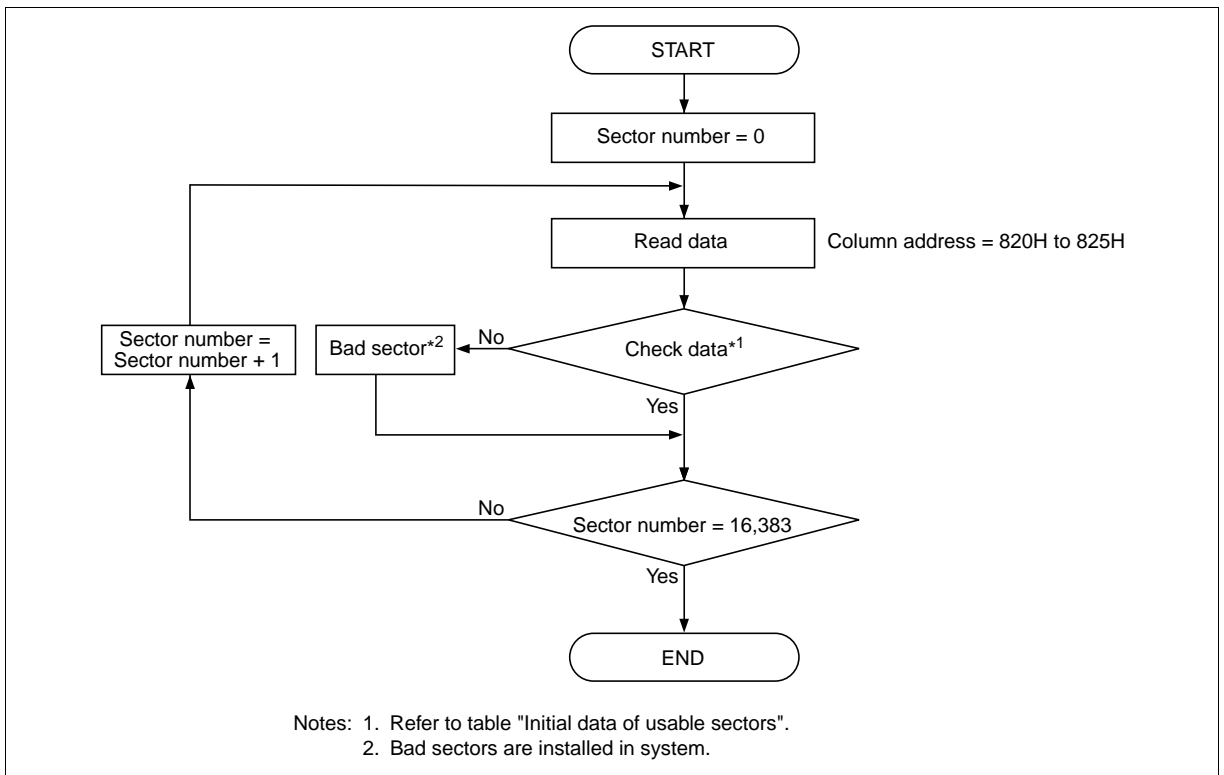

Initially, the HN29W25611S includes unusable sectors. The unusable sectors must be distinguished from the usable sectors by the system as follows.

1. Check the partial invalid sectors in the devices on the system. The usable sectors were programmed the following data. Refer to the flowchart "The Unusable Sector Indication Flow".

Initial Data of Usable Sectors

Column address	0H to 81FH	820H	821H	822H	823H	824H	825H	826H to 83FH
Data	FFH	1CH	71H	C7H	1CH	71H	C7H	FFH

2. Do not erase and program to the partial invalid sectors by the system.

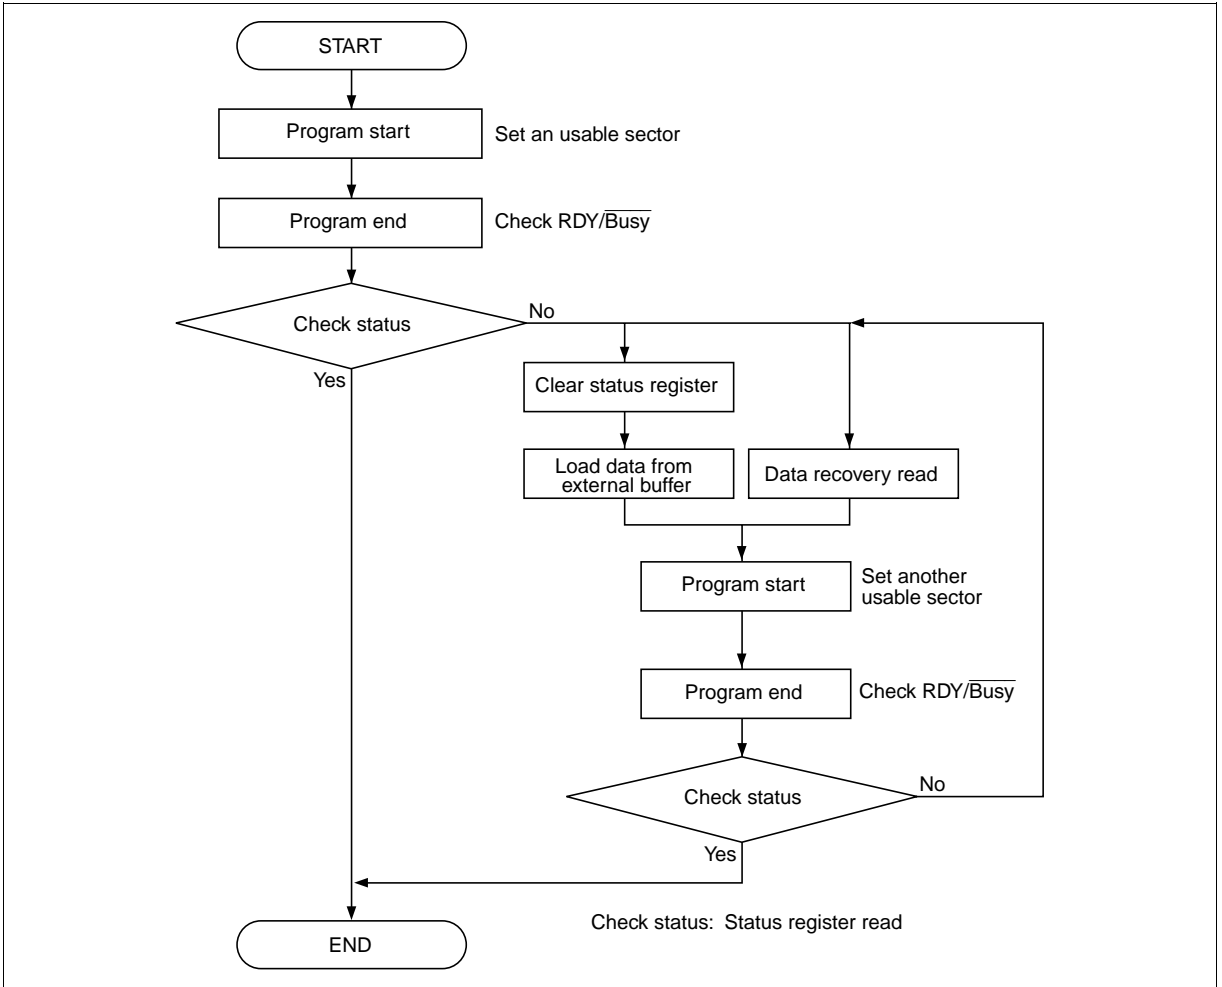

The Unusable Sector Indication Flow

Requirements for High System Reliability

The device may fail during a program, erase or read operation due to write or erase cycles. The following architecture will enable high system reliability if a failure occurs.

1. For an error in read operation: An error correction more than 3-bit error correction per each sector read is required for data reliability.
2. For errors in program or erase operations: The device may fail during a program or erase operation due to write or erase cycles. The status register indicates if the erase and program operation complete in a finite time. When an error occurred in the sector, try to reprogram the data into another sector. Avoid further system access to the sector that error happens. Typically, recommended number of a spare sectors are 1.8% of initial usable 16,057 sectors by each device. If the number of failed sectors exceeds the number of the spare sectors, usable data area in the device decreases. For the reprogramming, do not use the data from the failed sectors, because the data from the failed sectors are not fixed. So the reprogram data must be the data reloaded from external buffer, or use the Data recovery read mode (see the “Mode Description” and under figure “Spare Sector Replacement Flow after Program Error”). To avoid consecutive sector failures, choose addresses of spare sectors as far as possible from the failed sectors.

Spare Sector Replacement Flow after Program Error

Memory Structure

Bit: Minimum unit of data.

Byte: Input/output data unit in programming and reading. (1 byte = 8 bits)

Sector: Page unit in erase, programming and reading. (1 sector = 2,112 bytes = 16,896 bits)

Device: 1 device = 16,384 sectors.

Cautions

1. Hitachi neither warrants nor grants licenses of any rights of Hitachi's or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Hitachi bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
3. Hitachi makes every attempt to ensure that its products are of high quality and reliability. However, contact Hitachi's sales office before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
4. Design your application so that the product is used within the ranges guaranteed by Hitachi particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Hitachi bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Hitachi product does not cause bodily injury, fire or other consequential damage due to operation of the Hitachi product.
5. This product is not designed to be radiation resistant.
6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Hitachi.
7. Contact Hitachi's sales office for any questions regarding this document or Hitachi semiconductor products.
