### **Features**

- High Performance, Low Power AVR® 8-bit Microcontroller
- Advanced RISC Architecture
  - 120 Powerful Instructions Most Single Clock Cycle Execution
  - 32 x 8 General Purpose Working Registers
  - Fully Static Operation
- High Endurance, Non-volatile Memory Segments
  - 2K/4K/8K Bytes of In-System, Self-programmable Flash Program Memory
    - Endurance: 10,000 Write/Erase Cycles
  - 128/256/512 Bytes of In-System Programmable EEPROM
    - Endurance: 100,000 Write/Erase Cycles
  - 128/256/512 Bytes of Internal SRAM
  - Data Retention: 20 years at 85°C / 100 years at 25°C
  - Programming Lock for Self-programming Flash & EEPROM Data Security
- Peripheral Features
  - One 8-bit and One 16-bit Timer/Counter with Two PWM Channels, Each
  - 10-bit ADC
    - 8 Single-ended Channels
    - 12 Differential ADC Channel Pairs with Programmable Gain (1x / 20x)
  - Programmable Watchdog Timer with Separate On-chip Oscillator
  - On-chip Analog Comparator
  - Universal Serial Interface
- Special Microcontroller Features
  - debugWIRE On-chip Debug System
  - In-System Programmable via SPI Port
  - Internal and External Interrupt Sources
    - Pin Change Interrupt on 12 Pins
  - Low Power Idle, ADC Noise Reduction, Standby and Power-down Modes
  - Enhanced Power-on Reset Circuit
  - Programmable Brown-out Detection Circuit with Software Disable Function
  - Internal Calibrated Oscillator
  - On-chip Temperature Sensor
- I/O and Packages
  - Available in 20-pin QFN/MLF/VQFN, 14-pin SOIC, 14-pin PDIP and 15-ball UFBGA
  - Twelve Programmable I/O Lines
- Operating Voltage:
  - 1.8 5.5V
- Speed Grade:
  - 0 4 MHz @ 1.8 5.5V
  - 0 10 MHz @ 2.7 5.5V
  - 0 20 MHz @ 4.5 5.5V
- Industrial Temperature Range: -40°C to +85°C
- Low Power Consumption
  - Active Mode:
    - 210 µA at 1.8V and 1 MHz
  - Idle Mode:
    - 33 µA at 1.8V and 1 MHz
  - Power-down Mode:
    - 0.1 μA at 1.8V and 25°C

## 1.1 Pin Descriptions

#### 1.1.1 VCC

Supply voltage.

#### 1.1.2 GND

Ground.

#### 1.1.3 Port B (PB3:PB0)

Port B is a 4-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability except PB3 which has the RESET capability. To use pin PB3 as an I/O pin, instead of RESET pin, program ('0') RSTDISBL fuse. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATtiny24A/44A/84A as listed in Section 10.2 "Alternate Port Functions" on page 58.

#### 1.1.4 **RESET**

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running and provided the reset pin has not been disabled. The minimum pulse length is given in Table 20-4 on page 176. Shorter pulses are not guaranteed to generate a reset.

The reset pin can also be used as a (weak) I/O pin.

#### 1.1.5 Port A (PA7:PA0)

Port A is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A has alternate functions as analog inputs for the ADC, analog comparator, timer/counter, SPI and pin change interrupt as described in "Alternate Port Functions" on page 58.

#### 2. Overview

ATtiny24A/44A/84A are low-power CMOS 8-bit microcontrollers based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATtiny24A/44A/84A achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

Figure 2-1. **Block Diagram** 

The AVR core combines a rich instruction set with 32 general purpose working registers. All 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

# **ATtiny24A/44A/84A**

The ATtiny24A/44A/84A provides the following features: 2K/4K/8K byte of In-System Programmable Flash, 128/256/512 bytes EEPROM, 128/256/512 bytes SRAM, 12 general purpose I/O lines, 32 general purpose working registers, an 8-bit Timer/Counter with two PWM channels, a 16-bit timer/counter with two PWM channels, Internal and External Interrupts, a 8-channel 10-bit ADC, programmable gain stage (1x, 20x) for 12 differential ADC channel pairs, a programmable Watchdog Timer with internal oscillator, internal calibrated oscillator, and four software selectable power saving modes. Idle mode stops the CPU while allowing the SRAM, Timer/Counter, ADC, Analog Comparator, and Interrupt system to continue functioning. ADC Noise Reduction mode minimizes switching noise during ADC conversions by stopping the CPU and all I/O modules except the ADC. In Power-down mode registers keep their contents and all chip functions are disbaled until the next interrupt or hardware reset. In Standby mode, the crystal/resonator oscillator is running while the rest of the device is sleeping, allowing very fast start-up combined with low power consumption.

The device is manufactured using Atmel's high density non-volatile memory technology. The onchip ISP Flash allows the Program memory to be re-programmed in-system through an SPI serial interface, by a conventional non-volatile memory programmer or by an on-chip boot code running on the AVR core.

The ATtiny24A/44A/84A AVR is supported with a full suite of program and system development tools including: C Compilers, Macro Assemblers, Program Debugger/Simulators and Evaluation kits.

## 3. General Information

### 3.1 Resources

A comprehensive set of drivers, application notes, data sheets and descriptions on development tools are available for download at http://www.atmel.com/avr.

## 3.2 Code Examples

This documentation contains simple code examples that briefly show how to use various parts of the device. These code examples assume that the part specific header file is included before compilation. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

For I/O Registers located in the extended I/O map, "IN", "OUT", "SBIS", "SBIC", "CBI", and "SBI" instructions must be replaced with instructions that allow access to extended I/O. Typically, this means "LDS" and "STS" combined with "SBRS", "SBRC", "SBR", and "CBR". Note that not all AVR devices include an extended I/O map.

## 3.3 Capacitive Touch Sensing

Atmel QTouch Library provides a simple to use solution for touch sensitive interfaces on Atmel AVR microcontrollers. The QTouch Library includes support for QTouch® and QMatrix® acquisition methods.

Touch sensing is easily added to any application by linking the QTouch Library and using the Application Programming Interface (API) of the library to define the touch channels and sensors. The application then calls the API to retrieve channel information and determine the state of the touch sensor.

The QTouch Library is free and can be downloaded from the Atmel website. For more information and details of implementation, refer to the QTouch Library User Guide – also available from the Atmel website.

#### 3.4 Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

#### 3.5 Disclaimer

Typical values contained in this datasheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min and Max values will be available after the device has been characterized.

Note:

- 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
- 2. I/O Registers within the address range 0x00 0x1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
- 3. Some of the Status Flags are cleared by writing a logical one to them. Note that, unlike most other AVRs, the CBI and SBI instructions will only operation the specified bit, and can therefore be used on registers containing such Status Flags. The CBI and SBI instructions work with registers 0x00 to 0x1F only.

Note1: Dimension "b" is measured at the maximum ball dia. in a plane parallel to the seating plane.

**BOTTOM VIEW** 

Note2: Dimension "b1" is the solderable surface defined by the opening of the solder resist layer.

## 7.5 20M2

# 8. Errata

The revision letters in this section refer to the revision of the corresponding ATtiny24A/44A/84A device.

# 8.1 ATtiny24A

8.1.1 Rev. H

No known errata.

8.1.2 Rev. G

Not sampled.

8.1.3 Rev. F

Not sampled.

# 8.2 ATtiny44A

8.2.1 Rev. G

No known errata. Yield improvement.

8.2.2 Rev. F

No known errata.

8.2.3 Rev. E

Not sampled.

# 8.3 ATtiny84A

8.3.1 Rev. C

No known errata.

# 9. Datasheet Revision History

#### 9.1 Rev. 8183D - 04/11

1. Added errata for ATtiny44A rev. G in Section 26. "Errata" on page 278

#### 9.2 Rev. 8183C - 03/11

- 1. Added:
  - ATtiny84A, including typical characteristics plots
  - Section 3.3 "Capacitive Touch Sensing" on page 6
  - Table 6-8, "Capacitance of Low-Frequency Crystal Oscillator," on page 28
  - Analog Comparator Offset plots for ATtiny24A (Figure 21.2.10 on page 208) and ATtiny44A (Figure 21.3.11 on page 236)
  - Extended temperature part numbers in Section 24. "Ordering Information" on page 270

#### 2. Updated:

- Bit syntax throughout the datasheet, e.g. from CS02:0 to CS0[2:0]
- Section 6.4 "Clock Output Buffer" on page 30, changed CLKO to CKOUT
- Table 16-4, "Single-Ended Input channel Selections," on page 145, added note for Internal 1.1V Reference
- Table 19-16, "High-voltage Serial Programming Instruction Set for ATtiny24A/44A/84A," on page 170, adjusted notes
- Table 20-1, "DC Characteristics. T<sub>A</sub> = -40°C to +85°C," on page 173, adjusted notes

## 9.3 Rev. 8183B - 03/10

- 1. Updated template.
- 2. Added UFBGA package (15CC1) in: "Features" on page 1, "Pin Configurations" on page 2, Section 24. "Ordering Information" on page 270, and Section 25.3 "15CC1" on page 275.
- 3. Separated typical characteristic plots, added Section 21.2 "ATtiny24A" on page 183.
- 4. Updated sections:
  - Section 14.5.4 "USIBR USI Buffer Register" on page 127, header updated
  - Section 24. "Ordering Information" on page 270, added tape & reel and topside marking, updated notes
- 5. Updated Figures:
  - Figure 4-1 "Block Diagram of the AVR Architecture" on page 7
  - Figure 8-1 "Reset Logic" on page 38
  - Figure 14-1 "Universal Serial Interface, Block Diagram" on page 116, USIDB -> USIBR
  - Figure 19-5 "High-voltage Serial Programming Waveforms" on page 169
- 6. Updated Tables:
  - Table 19-11, "Minimum Wait Delay Before Writing the Next Flash or EEPROM Location," on page 164, updated value for t<sub>WD ERASE</sub>

### 9.4 Rev. 8183A - 12/08

- 1. Initial revision. Created from document 8006H.
- Updated "Ordering Information" on page 278 and page 278. Pb-plated packages are no longer offered and there are no separate ordering codes for commercial operation range, the only available option now is industrial. Also, updated some order codes to reflect changes in leadframe composition and added VQFN package option.
- 3. Updated data sheet template.
- 4. Removed all references to 8K device.
- 5. Updated characteristic plots of section "Typical Characteristics", starting on page 182.
- 6. Added characteristic plots:
  - "Bandgap Voltage vs. Supply Voltage" on page 233
  - "Bandgap Voltage vs. Temperature" on page 233
- 7. Updated sections:
  - "Features" on page 1
  - "Power Reduction Register" on page 35
  - "Analog Comparator" on page 128
  - "Features" on page 132
  - "Operation" on page 133
  - "Starting a Conversion" on page 134
  - "ADC Voltage Reference" on page 139
  - "Speed" on page 174
- 8. Updated Figures:
  - "Program Memory Map" on page 15
  - "Data Memory Map" on page 16
- 9. Update Tables:
  - "Device Signature Bytes" on page 161
  - "DC Characteristics.  $T_A = -40$  "C to +85 "C" on page 173
  - "Additional Current Consumption for the different I/O modules (absolute values)" on page 182
  - "Additional Current Consumption (percentage) in Active and Idle mode" on page 183
