CMOS
80 MHz, Triple 10-Bit Video DACs

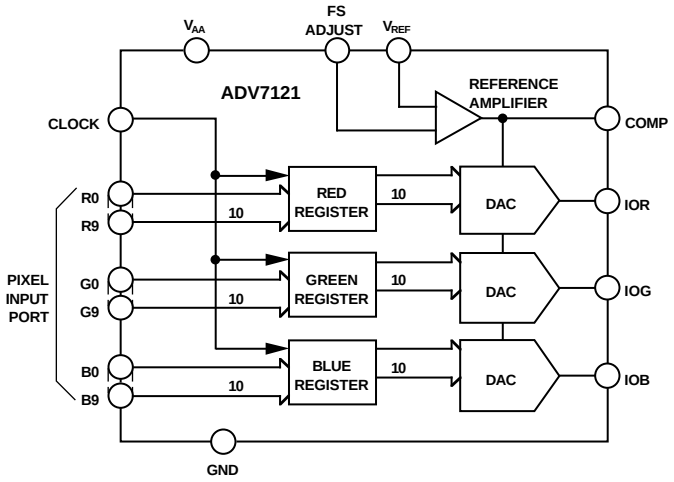
ADV7121/ADV7122

FEATURES
80 MHz Pipelined Operation
Triple 10-Bit D/A Converters
RS-343A/RS-170 Compatible Outputs
TTL Compatible Inputs
+5 V CMOS Monolithic Construction
40-Pin DIP Package (ADV7121)
44-Pin PLCC Package (ADV7122)
48-Lead TQFP (ADV7122)

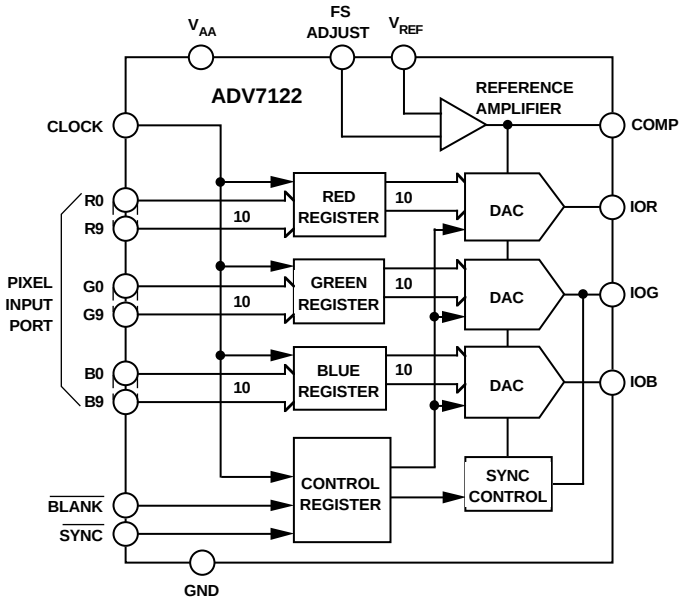
APPLICATIONS
High Definition Television (HDTV)
High Resolution Color Graphics
CAE/CAD/CAM Applications
Image Processing
Instrumentation
Video Signal Reconstruction
Direct Digital Synthesis (DDS)
I/Q Modulation

SPEED GRADES
80 MHz
50 MHz
30 MHz

ADV7121 FUNCTIONAL BLOCK DIAGRAM



ADV7122 FUNCTIONAL BLOCK DIAGRAM



GENERAL DESCRIPTION

The ADV7121/ADV7122 (ADV®) is a video speed, digital-to-analog converter on a single monolithic chip. The part is specifically designed for high resolution color graphics and video systems including high definition television (HDTV). It is also ideal for any application requiring a low cost, high speed DAC function especially in communications. It consists of three, high speed, 10-bit, video D/A converters (RGB), a standard TTL input interface and high impedance, analog output, current sources.

The ADV7121/ADV7122 has three separate, 10-bit, pixel input ports, one each for red, green and blue video data. A single +5 V power supply, an external 1.23 V reference and pixel clock input is all that is required to make the part operational. The ADV7122 has additional video control signals, composite $\overline{\text{SYNC}}$ and $\overline{\text{BLANK}}$.

The ADV7121/ADV7122 is capable of generating RGB video output signals which are compatible with RS-343A, RS-170 and most proposed production system HDTV video standards, including SMPTE 240M.

The ADV7121/ADV7122 is fabricated in a +5 V CMOS process. Its monolithic CMOS construction ensures greater functionality with low power dissipation. The ADV7121 is packaged in a 0.6", 40-pin plastic DIP package. The ADV7122 is packaged in a 44-pin plastic leaded (J-lead) chip carrier, PLCC, and 48-lead thin quad flatpack (TQFP).

PRODUCT HIGHLIGHTS

1. Fast video refresh rate, 80 MHz.
2. Guaranteed monotonic to 10 bits. Ten bits of resolution allows for implementation of linearization functions such as gamma correction and contrast enhancement.
3. Compatible with a wide variety of high resolution color graphics systems including RS-343A/RS-170 and the proposed SMPTE 240M standard for HDTV.

ADV is a registered trademark of Analog Devices, Inc.
*Speed grades up to 140 MHz are also available on special request. Please contact Analog Devices or its representatives for details.

RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min	Typ	Max	Units
Power Supply	V_{AA}	4.75	5.00	5.25	Volts
Ambient Operating Temperature	T_A	0		+70	°C
Output Load	R_L		37.5		Ω
Reference Voltage	V_{REF}	1.14	1.235	1.26	Volts

ABSOLUTE MAXIMUM RATINGS[1]

V_{AA} to GND ..... +7 V
Voltage on Any Digital Pin ..... GND –0.5 V to V_{AA} + 0.5 V
Ambient Operating Temperature (T_A) ..... 0°C to +70°C
Storage Temperature (T_S) ..... –65°C to +150°C
Junction Temperature (T_J) ..... +150°C
Soldering Temperature (5 secs) ..... 220°C
Vapor Phase Soldering (1 minute) ..... 220°C
IOR, IOB, IOG to GND[2] ..... 0 V to V_{AA}

NOTES
[1]Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
[2]Analog output short circuit to any power supply or common can be of an indefinite duration.

PIN CONFIGURATIONS

ADV7122KST30	30 MHz	0°C to +70°C	48-Lead Thin Quad Flatpack (TQFP)	ST-48

*Industrial Temperature range (–40°C to +85°C) parts are also available to special ranges. Please contact your local Analog Devices representative.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADV7121/ADV7122 feature proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

PIN FUNCTION DESCRIPTION

Pin Mnemonic	Function
$\overline{\text{BLANK}}$*	Composite blank control input (TTL compatible). A logic zero on this control input drives the analog outputs, IOR, IOB and IOG, to the blanking level. The $\overline{\text{BLANK}}$ signal is latched on the rising edge of CLOCK. While $\overline{\text{BLANK}}$ is a logical zero, the R0–R9, G0–G9 and R0–R9 pixel inputs are ignored.
$\overline{\text{SYNC}}$*	Composite sync control input (TTL compatible). A logical zero on the $\overline{\text{SYNC}}$ input switches off a 40 IRE current source. This is internally connected to the IOG analog output. $\overline{\text{SYNC}}$ does not override any other control or data input, therefore, it should only be asserted during the blanking interval. $\overline{\text{SYNC}}$ is latched on the rising edge of CLOCK. If sync information is not required on the green channel, the $\overline{\text{SYNC}}$ input should be tied to logical zero.
CLOCK	Clock input (TTL compatible). The rising edge of CLOCK latches the R0–R9, G0–G9, B0–B9, $\overline{\text{SYNC}}$ and $\overline{\text{BLANK}}$ pixel and control inputs. It is typically the pixel clock rate of the video system. CLOCK should be driven by a dedicated TTL buffer.
R0–R9, G0–G9, B0–B9	Red, green and blue pixel data inputs (TTL compatible). Pixel data is latched on the rising edge of CLOCK. R0, G0 and B0 are the least significant data bits. Unused pixel data inputs should be connected to either the regular PCB power or ground plane.
IOR, IOG, IOB	Red, green, and blue current outputs. These high impedance current sources are capable of directly driving a doubly terminated 75 Ω coaxial cable. All three current outputs should have similar output loads whether or not they are all being used.
FS ADJUST	Full-scale adjust control. A resistor (R_{SET}) connected between this pin and GND, controls the magnitude of the full-scale video signal. Note that the IRE relationships are maintained, regardless of the full-scale output current. The relationship between R_{SET} and the full-scale output current on IOG (assuming I_{SYNC} is connected to IOG) is given by: R_{SET} (Ω) = 12,082 × V_{REF} (V)/IOG (mA) The relationship between R_{SET} and the full-scale output current on IOR, IOG and IOB is given by: IOG* (mA) = 12,082 × V_{REF} (V)/R_{SET} (Ω) ($\overline{\text{SYNC}}$ being asserted) IOR, IOB (mA) = 8,628 × V_{REF} (V)/R_{SET} (Ω) The equation for IOG will be the same as that for IOR and IOB when $\overline{\text{SYNC}}$ is not being used, i.e., $\overline{\text{SYNC}}$ tied permanently low. For the ADV7121, all three analog output currents are as described by: IOR, IOG, IOB (mA) = 7,969 × V_{REF} (V)/R_{SET} (Ω)
COMP	Compensation pin. This is a compensation pin for the internal reference amplifier. A 0.1 μF ceramic capacitor must be connected between COMP and V_{AA}.
V_{REF}	Voltage reference input. An external 1.23 V voltage reference must be connected to this pin. The use of an external resistor divider network is not recommended. A 0.1 μF decoupling ceramic capacitor should be connected between V_{REF} and V_{AA}.
V_{AA}	Analog power supply (5 V ± 5%). All V_{AA} pins on the ADV7121/ADV7122 must be connected.
GND	Ground. All GND pins must be connected.

*$\overline{\text{SYNC}}$ and $\overline{\text{BLANK}}$ functions are not provided on the ADV7121.

TERMINOLOGY

Blanking Level
The level separating the $\overline{SYNC}$ portion from the video portion of the waveform. Usually referred to as the front porch or back porch. At 0 IRE units, it is the level which will shut off the picture tube, resulting in the blackest possible picture.

Color Video (RGB)
This usually refers to the technique of combining the three primary colors of red, green and blue to produce color pictures within the usual spectrum. In RGB monitors, three DACs are required, one for each color.

Sync Signal ($\overline{SYNC}$)
The position of the composite video signal which synchronizes the scanning process.

Gray Scale
The discrete levels of video signal between reference black and reference white levels. A 10-bit DAC contains 1024 different levels, while an 8-bit DAC contains 256.

Raster Scan
The most basic method of sweeping a CRT one line at a time to generate and display images.

Reference Black Level
The maximum negative polarity amplitude of the video signal.

Reference White Level
The maximum positive polarity amplitude of the video signal.

Sync Level
The peak level of the $\overline{SYNC}$ signal.

Video Signal
That portion of the composite video signal which varies in gray scale levels between reference white and reference black. Also referred to as the picture signal, this is the portion which may be visually observed.

CIRCUIT DESCRIPTION & OPERATION

The ADV7121/ADV7122 contains three 10-bit D/A converters, with three input channels, each containing a 10-bit register. Also integrated on board the part is a reference amplifier. CRT control functions $\overline{BLANK}$ and $\overline{SYNC}$ are integrated on board the ADV7122.

Digital Inputs
Thirty bits of pixel data (color information) R0–R9, G0–G9 and B0–B9 are latched into the device on the rising edge of each clock cycle. This data is presented to the three 10-bit DACs and is then converted to three analog (RGB) output waveforms. See Figure 2.

The ADV7122 has two additional control signals, which are latched to the analog video outputs in a similar fashion. $\overline{BLANK}$ and $\overline{SYNC}$ are each latched on the rising edge of CLOCK to maintain synchronization with the pixel data stream.

The $\overline{BLANK}$ and $\overline{SYNC}$ functions allow for the encoding of these video synchronization signals onto the RGB video output. This is done by adding appropriately weighted current sources to the analog outputs, as determined by the logic levels on the $\overline{BLANK}$ and $\overline{SYNC}$ digital inputs. Figure 3 shows the analog output, RGB video waveform of the ADV7121/ADV7122. The influence of $\overline{SYNC}$ and $\overline{BLANK}$ on the analog video waveform is illustrated.

Table I details the resultant effect on the analog outputs of $\overline{BLANK}$ and $\overline{SYNC}$.

All these digital inputs are specified to accept TTL logic levels.

Clock Input
The CLOCK input of the ADV7121/ADV7122 is typically the pixel clock rate of the system. It is also known as the dot rate. The dot rate, and hence the required CLOCK frequency, will be determined by the on-screen resolution, according to the following equation:

$$Dot\ Rate = (Horiz\ Res) \times (Vert\ Res) \times (Refresh\ Rate) / (Retrace\ Factor)$$

Horiz Res	=	Number of Pixels/Line.
Vert Res	=	Number of Lines/Frame.
Refresh Rate	=	Horizontal Scan Rate. This is the rate at which the screen must be refreshed, typically 60 Hz for a noninterlaced system or 30 Hz for an interlaced system.
Retrace Factor	=	Total Blank Time Factor. This takes into account that the display is blanked for a certain fraction of the total duration of each frame (e.g., 0.8).

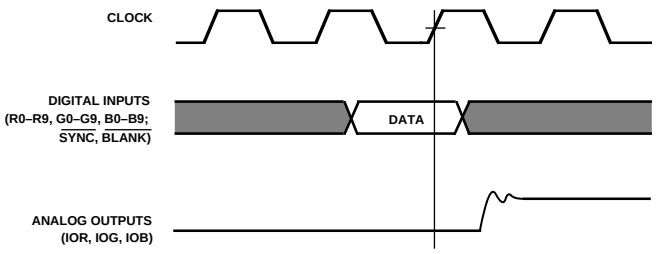

Figure 2. Video Data Input/Output

If we, therefore, have a graphics system with a 1024 × 1024 resolution, a noninterlaced 60 Hz refresh rate and a retrace factor of 0.8, then:

Dot Rate = 1024 × 1024 × 60/0.8
= 78.6 MHz

The required CLOCK frequency is thus 78.6 MHz.

All video data and control inputs are latched into the ADV7121/ADV7122 on the rising edge of CLOCK, as previously described in the "Digital Inputs" section. It is recommended that the CLOCK input to the ADV7121/ADV7122 be driven by a TTL buffer (e.g., 74F244).

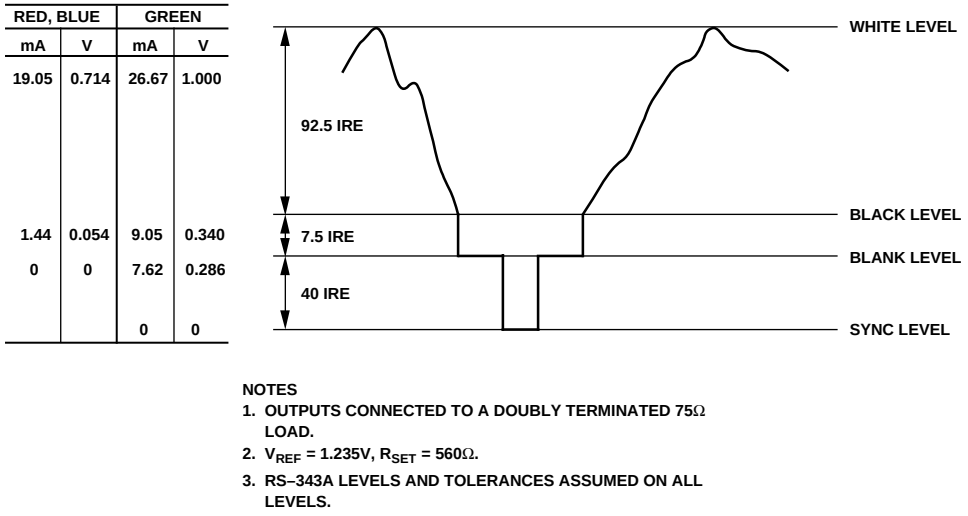

Figure 3. RGB Video Output Waveform

Table Ia. Video Output Truth Table for the ADV7122

Description	IOG (mA)*	IOR, IOB (mA)	$\overline{\text{SYNC}}$	$\overline{\text{BLANK}}$	DAC Input Data
WHITE LEVEL	26.67	19.05	1	1	3FFH
VIDEO	video + 9.05	video + 1.44	1	1	data
VIDEO to BLANK	video + 1.44	video + 1.44	0	1	data
BLACK LEVEL	9.05	1.44	1	1	00H
BLACK to BLANK	1.44	1.44	0	1	00H
BLANK LEVEL	7.62	0	1	0	xxH
SYNC LEVEL	0	0	0	0	xxH

*Typical with full-scale IOG = 26.67 mA. V_{REF} = 1.235 V, R_{SET} = 560 Ω, I_{SYNC} connected to IOG.

Table Ib. Video Output Truth Table for the ADV7121

Description	IOR, IOG, IOB (mA)*	DAC Input Data
WHITE LEVEL	17.62	3FF
VIDEO	video	data
VIDEO to BLACK	video	data
BLACK LEVEL	0	00H

*Typical with full scale = 17.62 mA. V_{REF} = 1.235 V, R_{SET} = 560 Ω.

Video Synchronization & Control

The ADV7122 has a single composite sync ($\overline{SYNC}$) input control. Many graphics processors and CRT controllers have the ability of generating horizontal sync (HSYNC), vertical sync (VSYNC) and composite $\overline{SYNC}$.

In a graphics system which does not automatically generate a composite $\overline{SYNC}$ signal, the inclusion of some additional logic circuitry will enable the generation of a composite $\overline{SYNC}$ signal.

The sync current is internally connected directly to the IOG output, thus encoding video synchronization information onto the green video channel. If it is not required to encode sync information onto the ADV7122, the $\overline{SYNC}$ input should be tied to logic low.

Reference Input

An external 1.23 V voltage reference is required to drive the ADV7121/ADV7122. The AD589 from Analog Devices is an ideal choice of reference. It is a two-terminal, low cost, temperature compensated bandgap voltage reference which provides a fixed 1.23 V output voltage for input currents between 50 µA and 5 mA. Figure 4 shows a typical reference circuit connection diagram. The voltage reference gets its current drive from the ADV7121/ADV7122's V_{AA} through an onboard 1 kΩ resistor to the V_{REF} pin. A 0.1 µF ceramic capacitor is required between the COMP pin and V_{AA}. This is necessary so as to provide compensation for the internal reference amplifier.

A resistance R_{SET} connected between FS ADJUST and GND determines the amplitude of the output video level according to Equations 1 and 2 for the ADV7122 and Equation 3 for the ADV7121:

$$IOG^{*}\ (mA) = 12{,}082 \times V_{REF}\ (V)/R_{SET}\ (\Omega) \quad (1)$$

$$IOR,\ IOB\ (mA) = 8{,}628 \times V_{REF}\ (V)/R_{SET}\ (\Omega) \quad (2)$$

$$IOR,\ IOG,\ IOB\ (mA) = 7{,}969 \times V_{REF}\ (V)/R_{SET}\ (\Omega) \quad (3)$$

Only applies to the ADV7122 when $\overline{SYNC}$ is being used. If $\overline{SYNC}$ is not being encoded onto the green channel, then Equation 1 will be similar to Equation 2.

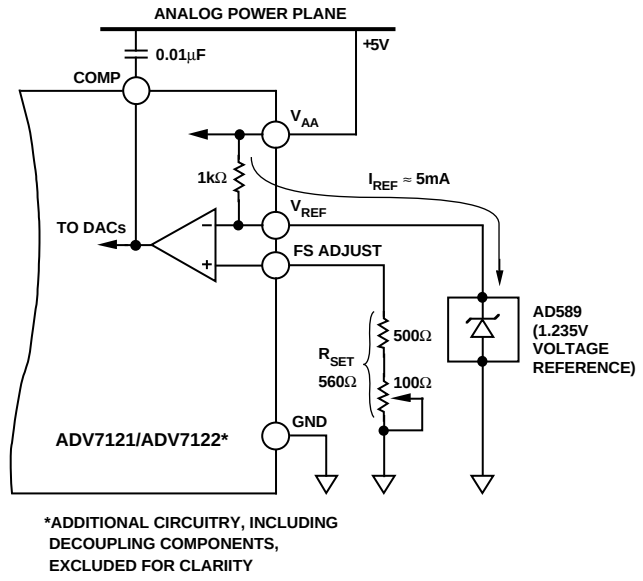

Figure 4. Reference Circuit

Using a variable value of R_{SET}, as shown in Figure 4, allows for accurate adjustment of the analog output video levels. Use of a fixed 560 Ω R_{SET} resistor yields the analog output levels as quoted in the specification page. These values typically correspond to the RS-343A video waveform values as shown in Figure 3.

D/A Converters

The ADV7121/ADV7122 contains three matched 10-bit D/A converters. The DACs are designed using an advanced, high speed, segmented architecture. The bit currents corresponding to each digital input are routed to either the analog output (bit = "1") or GND (bit = "0") by a sophisticated decoding scheme. As all this circuitry is on one monolithic device, matching between the three DACs is optimized. As well as matching, the use of identical current sources in a monolithic design guarantees monotonicity and low glitch. The onboard operational amplifier stabilizes the full-scale output current against temperature and power supply variations.

Analog Outputs

The ADV7121/ADV7122 has three analog outputs, corresponding to the red, green and blue video signals.

The red, green and blue analog outputs of the ADV7121/ADV7122 are high impedance current sources. Each one of these three RGB current outputs is capable of directly driving a 37.5 Ω load, such as a doubly terminated 75 Ω coaxial cable. Figure 5a shows the required configuration for each of the three RGB outputs connected into a doubly terminated 75 Ω load. This arrangement will develop RS-343A video output voltage levels across a 75 Ω monitor.

A suggested method of driving RS-170 video levels into a 75 Ω monitor is shown in Figure 5b. The output current levels of the DACs remain unchanged, but the source termination resistance, Z_S, on each of the three DACs is increased from 75 Ω to 150 Ω.

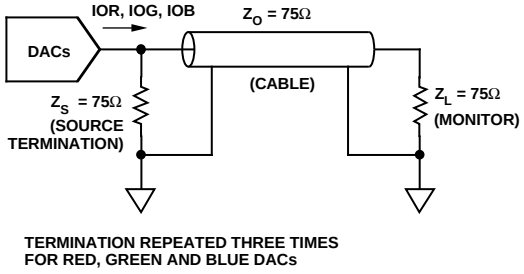

Figure 5a. Analog Output Termination for RS-343A

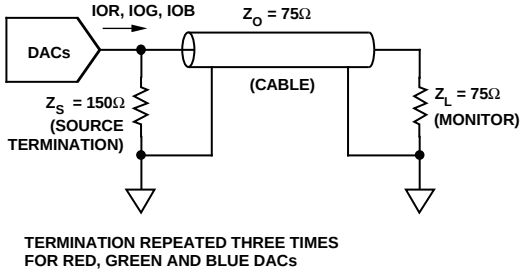

Figure 5b. Analog Output Termination for RS-170

More detailed information regarding load terminations for various output configurations, including RS-343A and RS-170, is available in an Application Note entitled "Video Formats & Required Load Terminations" available from Analog Devices, publication no. E1228–15–1/89.

Figure 3 shows the video waveforms associated with the three RGB outputs driving the doubly terminated 75 Ω load of Figure 5a. As well as the gray scale levels, Black Level to White Level, the diagram also shows the contributions of $\overline{SYNC}$ and $\overline{BLANK}$ for the ADV7122. These control inputs add appropriately weighted currents to the analog outputs, producing the specific output level requirements for video applications. Table Ia. details how the $\overline{SYNC}$ and $\overline{BLANK}$ inputs modify the output levels.

Gray Scale Operation

The ADV7121/ADV7122 can be used for stand-alone, gray scale (monochrome) or composite video applications (i.e., only one channel used for video information). Any one of the three channels, RED, GREEN or BLUE can be used to input the digital video data. The two unused video data channels should be tied to logical zero. The unused analog outputs should be terminated with the same load as that for the used channel. In other words, if the red channel is used and IOR is terminated with a doubly terminated 75 Ω load (37.5 Ω), IOB and IOG should be terminated with 37.5 Ω resistors. See Figure 6.

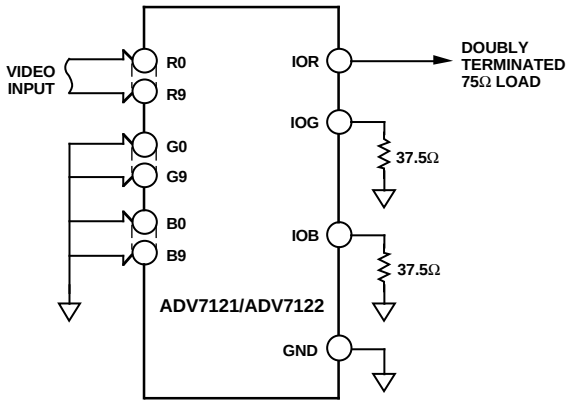

Figure 6. Input and Output Connections for Stand-Alone Gray Scale or Composite Video

Video Output Buffers

The ADV7121/ADV7122 is specified to drive transmission line loads, which is what most monitors are rated as. The analog output configurations to drive such loads are described in the Analog Interface section and illustrated in Figure 5. However, in some applications it may be required to drive long "transmission line" cable lengths. Cable lengths greater than 10 meters can attenuate and distort high frequency analog output pulses. The inclusion of output buffers will compensate for some cable distortion. Buffers with large full power bandwidths and gains between 2 and 4 will be required. These buffers will also need to be able to supply sufficient current over the complete output voltage swing. Analog Devices produces a range of suitable op amps for such applications. These include the AD84x series of monolithic op amps. In very high frequency applications (80 MHz), the AD9617 is recommended. More information on line driver buffering circuits is given in the relevant op amp data sheets.

Use of buffer amplifiers also allows implementation of other video standards besides RS-343A and RS-170. Altering the gain components of the buffer circuit will result in any desired video level.

PC Board Layout Considerations

The ADV7121/ADV7122 is optimally designed for lowest noise performance, both radiated and conducted noise. To complement the excellent noise performance of the ADV7121/ADV7122 it is imperative that great care be given to the PC board layout. Figure 8 shows a recommended connection diagram for the ADV7121/ADV7122.

The layout should be optimized for lowest noise on the ADV7121/ADV7122 power and ground lines. This can be achieved by shielding the digital inputs and providing good decoupling. The lead length between groups of V_{AA} and GND pins should by minimized so as to minimize inductive ringing.

Ground Planes

The ADV7121/ADV7122 and associated analog circuitry, should have a separate ground plane referred to as the analog ground plane. This ground plane should connect to the regular PCB ground plane at a single point through a ferrite bead, as illustrated in Figure 8. This bead should be located as close as possible (within 3 inches) to the ADV7121/ADV7122.

The analog ground plane should encompass all ADV7121/ADV7122 ground pins, voltage reference circuitry, power supply bypass circuitry, the analog output traces and any output amplifiers.

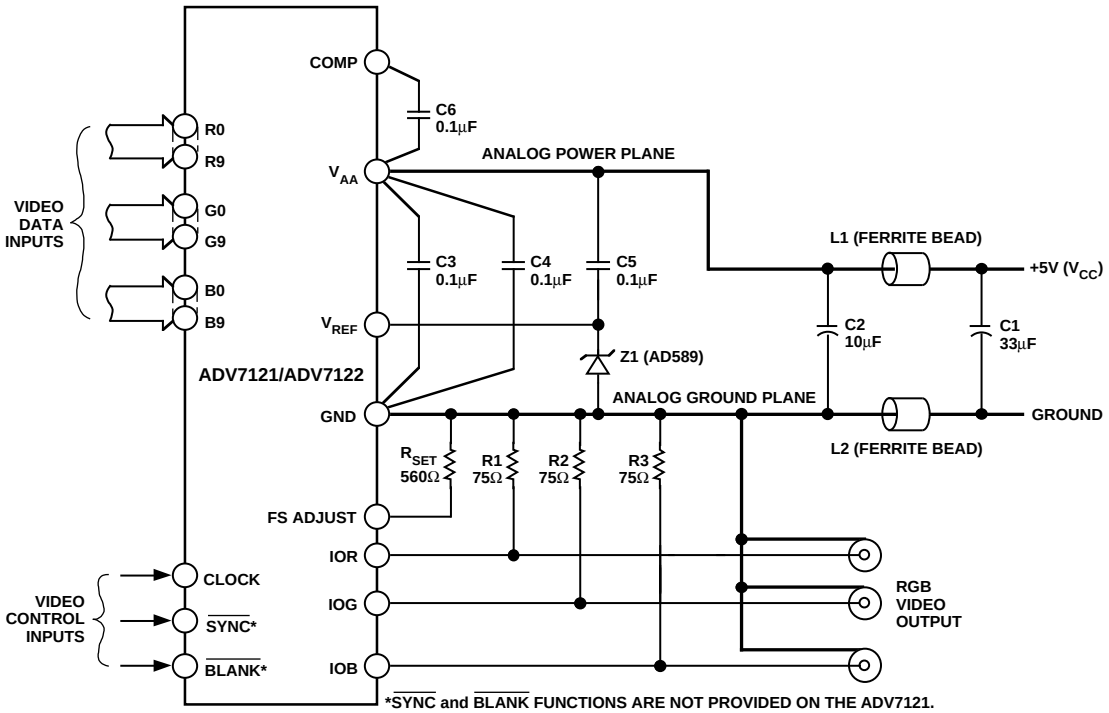
The regular PCB ground plane area should encompass all the digital signal traces, excluding the ground pins, leading up to the ADV7121/ADV7122.

Power Planes

The PC board layout should have two distinct power planes, one for analog circuitry and one for digital circuitry. The analog power plane should encompass the ADV7121/ADV7122 (V_{AA}) and all associated analog circuitry. This power plane should be connected to the regular PCB power plane (V_{CC}) at a single point through a ferrite bead, as illustrated in Figure 8. This bead should be located within three inches of the ADV7121/ADV7122.

The PCB power plane should provide power to all digital logic on the PC board, and the analog power plane should provide power to all ADV7121/ADV7122 power pins, voltage reference circuitry and any output amplifiers.

The PCB power and ground planes should not overlay portions of the analog power plane. Keeping the PCB power and ground planes from overlaying the analog power plane will contribute to a reduction in plane-to-plane noise coupling.



COMPONENT	DESCRIPTION	VENDOR PART NUMBER
C1	33µF TANTALUM CAPACITOR	
C2	10µF TANTALUM	
C3, C4, C5, C6	0.1µF CERAMIC CAPACITOR	
L1, L2	FERRITE BEAD	FAIR-RITE 274300111 OR MURATA BL01/02/03
R1, R2, R3	75Ω 1% METAL FILM RESISTOR	DALE CMF-55C
R_{SET}	560Ω 1% METAL FILM RESISTOR	DALE CMF-55C
Z1	1.235V VOLTAGE REFERENCE	ANALOG DEVICES AD589JH

Supply Decoupling

Noise on the analog power plane can be further reduced by the use of multiple decoupling capacitors (see Figure 8).

Optimum performance is achieved by the use of 0.1 µF ceramic capacitors. Each of the two groups of V_{AA} should be individually decoupled to ground. This should be done by placing the capacitors as close as possible to the device with the capacitor leads as short as possible, thus minimizing lead inductance.

It is important to note that while the ADV7121/ADV7122 contains circuitry to reject power supply noise, this rejection decreases with frequency. If a high frequency switching power supply is used, the designer should pay close attention to reduce ing power supply noise. A dc power supply filter (Murata BNX002) will provide EMI suppression between the switching power supply and the main PCB. Alternatively, consideration could be given to using a three terminal voltage regulator.

Digital Signal Interconnect

The digital signal lines to the ADV7121/ADV7122 should be isolated as much as possible from the analog outputs and other analog circuitry. Digital signal lines should not overlay the analog power plane.

Due to the high clock rates used, long clock lines to the ADV7121/ADV7122 should be avoided so as to minimize noise pickup.

Any active pull-up termination resistors for the digital inputs should be connected to the regular PCB power plane (V_{CC}), and not the analog power plane.

Analog Signal Interconnect

The ADV7121/ADV7122 should be located as close as possible to the output connectors thus minimizing noise pickup and reflections due to impedance mismatch.

The video output signals should overlay the ground plane, and not the analog power plane, thereby maximizing the high frequency power supply rejection.

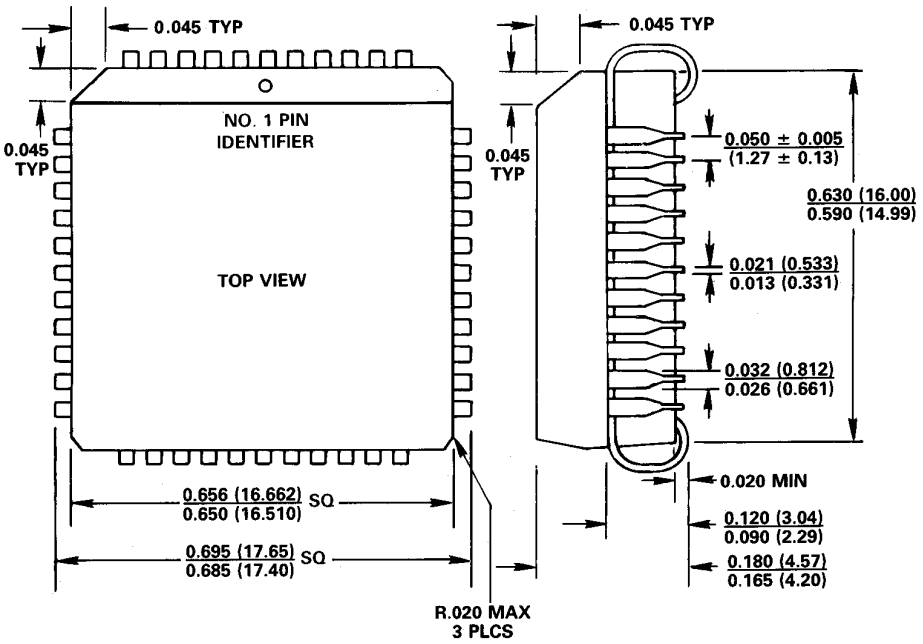
For optimum performance, the analog outputs should each have a source termination resistance to ground of 75 Ω (doubly terminated 75 Ω configuration). This termination resistance should be as close as possible to the ADV7121/ADV7122 so as to minimize reflections.

Additional information on PCB design is available in an application note entitled “Design and Layout of a Video Graphics System for Reduced EMI.” This application note is available from Analog Devices, publication no. E1309–15–10/89.

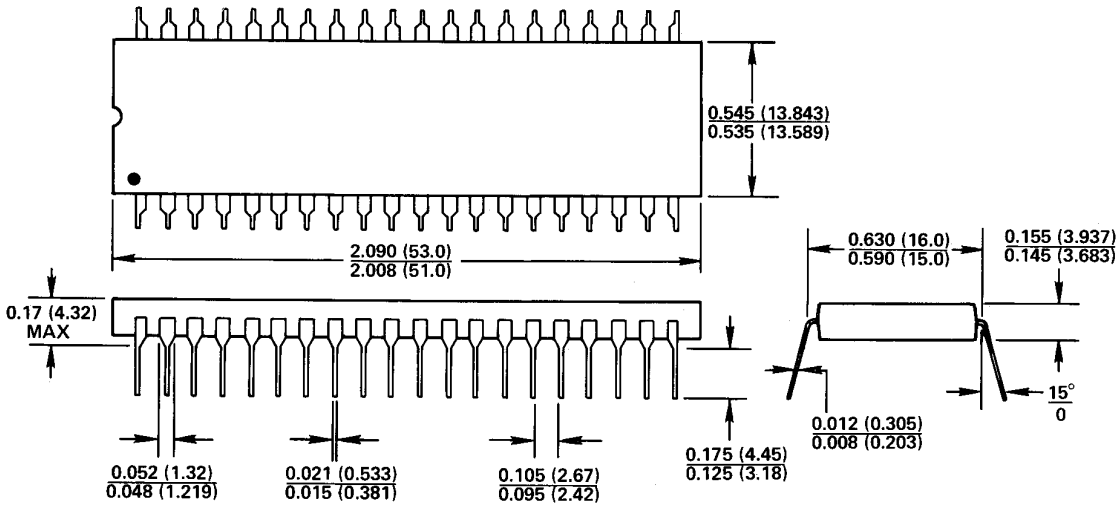
OUTLINE DIMENSIONS

Dimensions shown in inches and (mm).

44-Terminal Plastic Leaded Chip Carrier
(P-44A)



40-Pin Plastic DIP
(N-40A)



LEAD NO. 1 IDENTIFIED BY DOT, NOTCH OR "1."
LEADS ARE SOLDER PLATED KOVAR OR ALLOY 42.
