TSH345

Triple video buffer with selectable filter for HD and SD video applications

Features

- Selectable 6th order filtering of 36 MHz, 18 MHz and 9 MHz
- 5 V single-supply operation
- Internal input DC level shifter
- No input capacitor required
- 3 matched 6 dB amplifiers
- AC or DC output-coupled
- Very low harmonic distortion
- Specified for 150 Ω loads
- Data min. and max. are tested during production

Applications

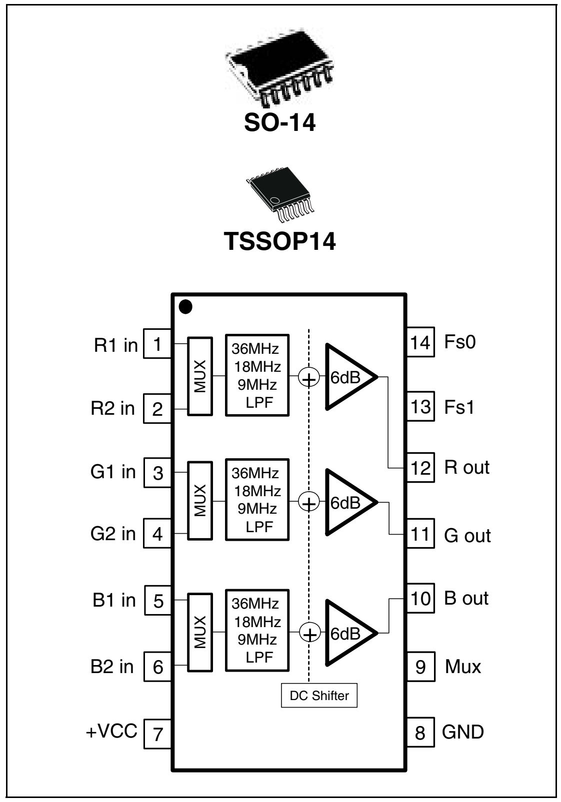
- High-end video systems
- High definition TV (HDTV)
- Broadcast and graphic video
- Multimedia products

Description

The TSH345 is a triple single-supply video buffer featuring an internal gain of 6 dB and selectable filtering for HD and SD video outputs on 75 Ω video lines. The TSH345 is ideal to drive YC, CVBS, YUV, YPbPr or RGB signals from video DAC outputs.

The main advantage of this circuit is its input DC level shifter. It allows driving video signals on 75 Ω video lines without damaging the synchronization tip and without input or output capacitors when using a single 5 V power supply. The DC level shifter is internally fixed and optimized to keep the output video signals between low and high output rails in the best position for the greatest linearity.

The TSH345 is available in SO-14 and TSSOP-14 plastic packages for optimum space saving.



1 Absolute maximum ratings and operating conditions

Table 1. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage (1)	6	V
V_{in}	Input voltage range	2.5	V
T_{oper}	Operating free air temperature range	-40 to +85	°C
T_{stg}	Storage temperature	-65 to +150	°C
T_j	Maximum junction temperature	150	°C
R_{thjc}	Thermal resistance junction to case SO-14 TSSOP14	 22 32	°C/W
R_{thja}	Thermal resistance junction to ambient area SO-14 TSSOP14	 125 110	°C/W
P_{max}	Maximum power dissipation (at T_{amb} = 25° C) for T_j = 150° C SO-14 TSSOP14	 1 1.1	W
ESD	CDM: charged device model HBM: human body model MM: machine model	250 2 100	V kV V

2.1 Power supply considerations: improving the power supply noise rejection

Correct power supply bypassing is very important to optimize performance in low- and high-frequency ranges. Bypass capacitors should be placed as close as possible to the IC pin (pin 4) to improve high-frequency bypassing. A capacitor (C_{LF}) greater than 10 µF is necessary to improve the PSRR in low frequencies. For better quality bypassing, you can add a capacitor of 100 nF (C_{HF}). C_{HF} must be placed as close as possible to the IC pin to improve the noise supply rejection in the higher frequencies. A coil can be added in order to better reject the noise from the supply and to prevent current peaks as much as possible.

Figure 26. Circuit for power supply bypassing

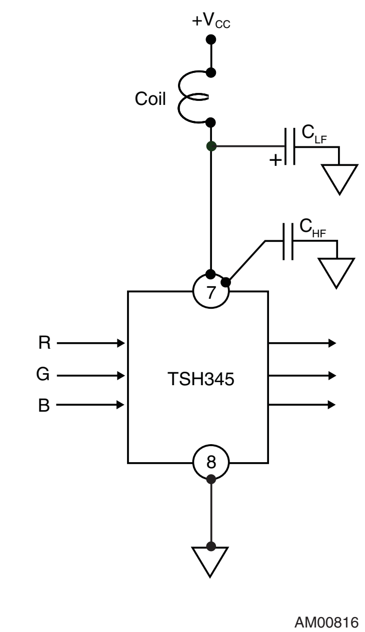

Figure 27. Circuit for noise rejection improvement measurement

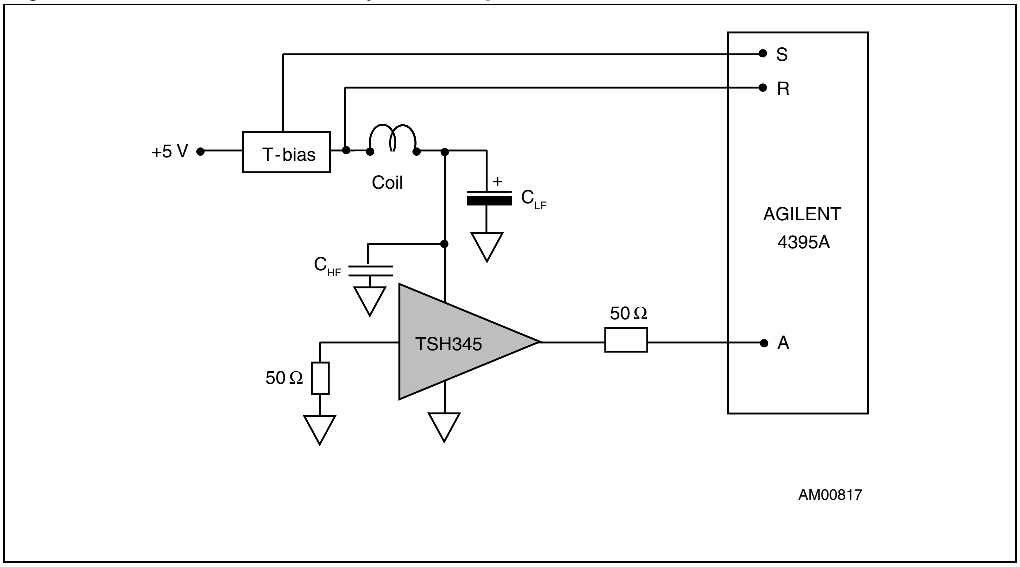

Figure 28 shows how the power supply noise rejection evolves according to the frequency and depending on how carefully power supply decoupling is achieved.

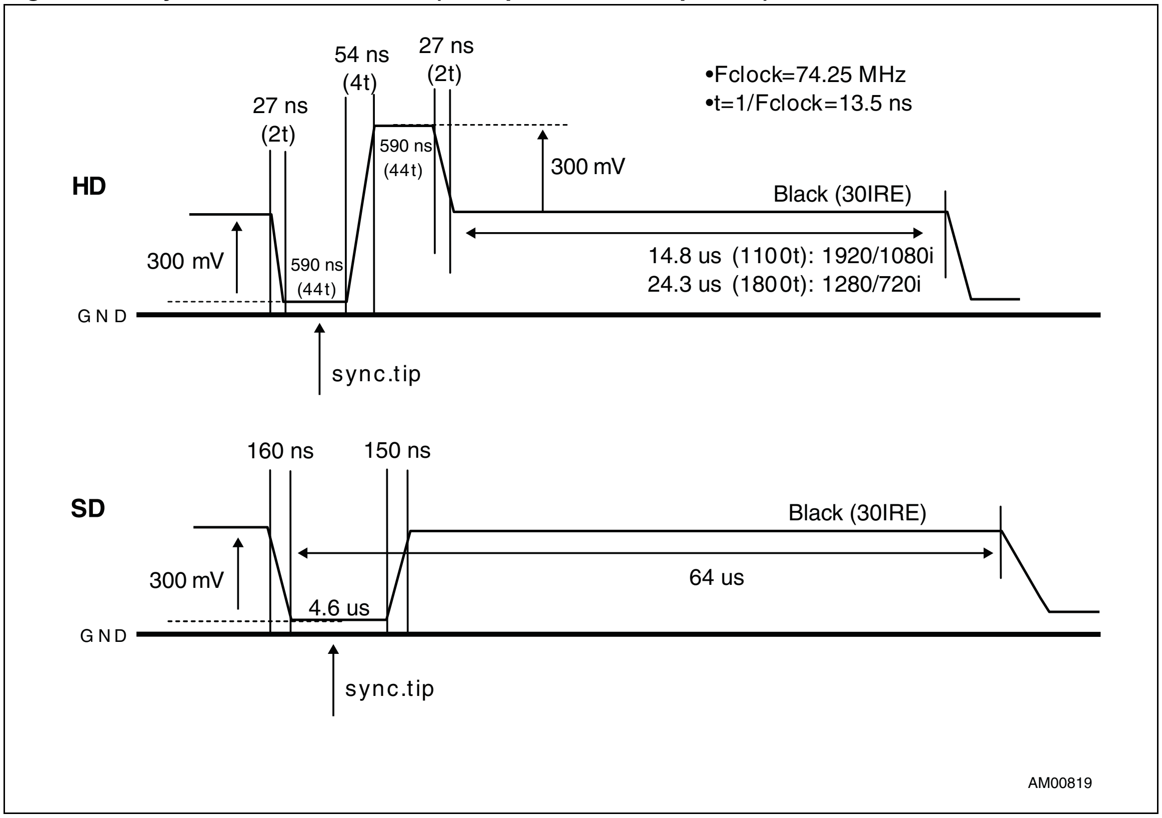

Figure 31. HD video signal

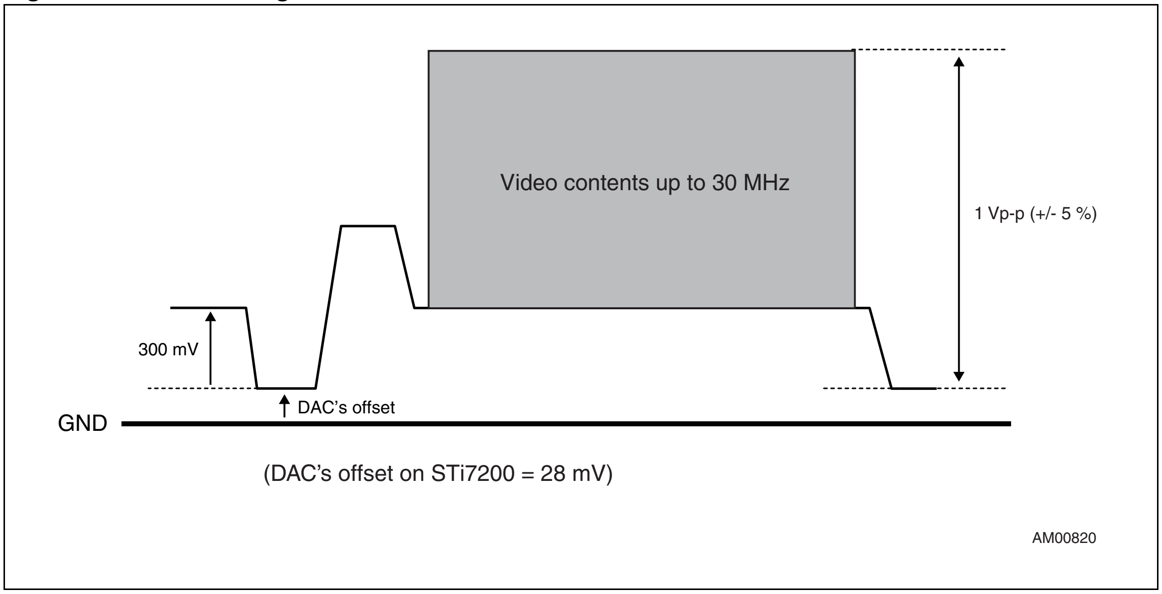

Figure 32. Standard video signal

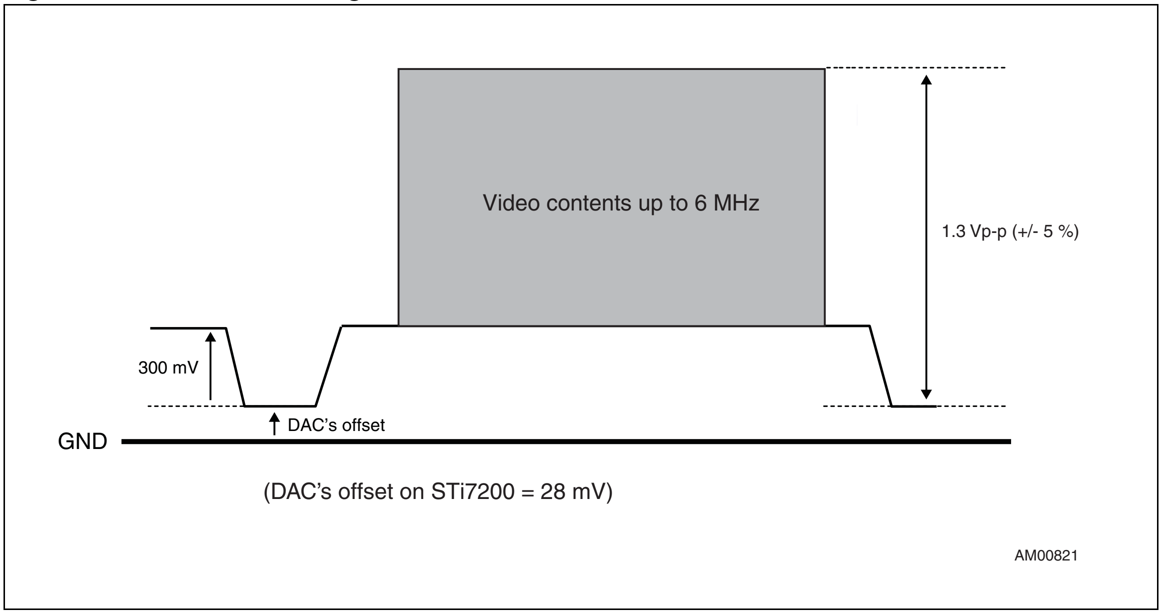

Figure 33. Flexibility of the TSH345 for SD and HD signals

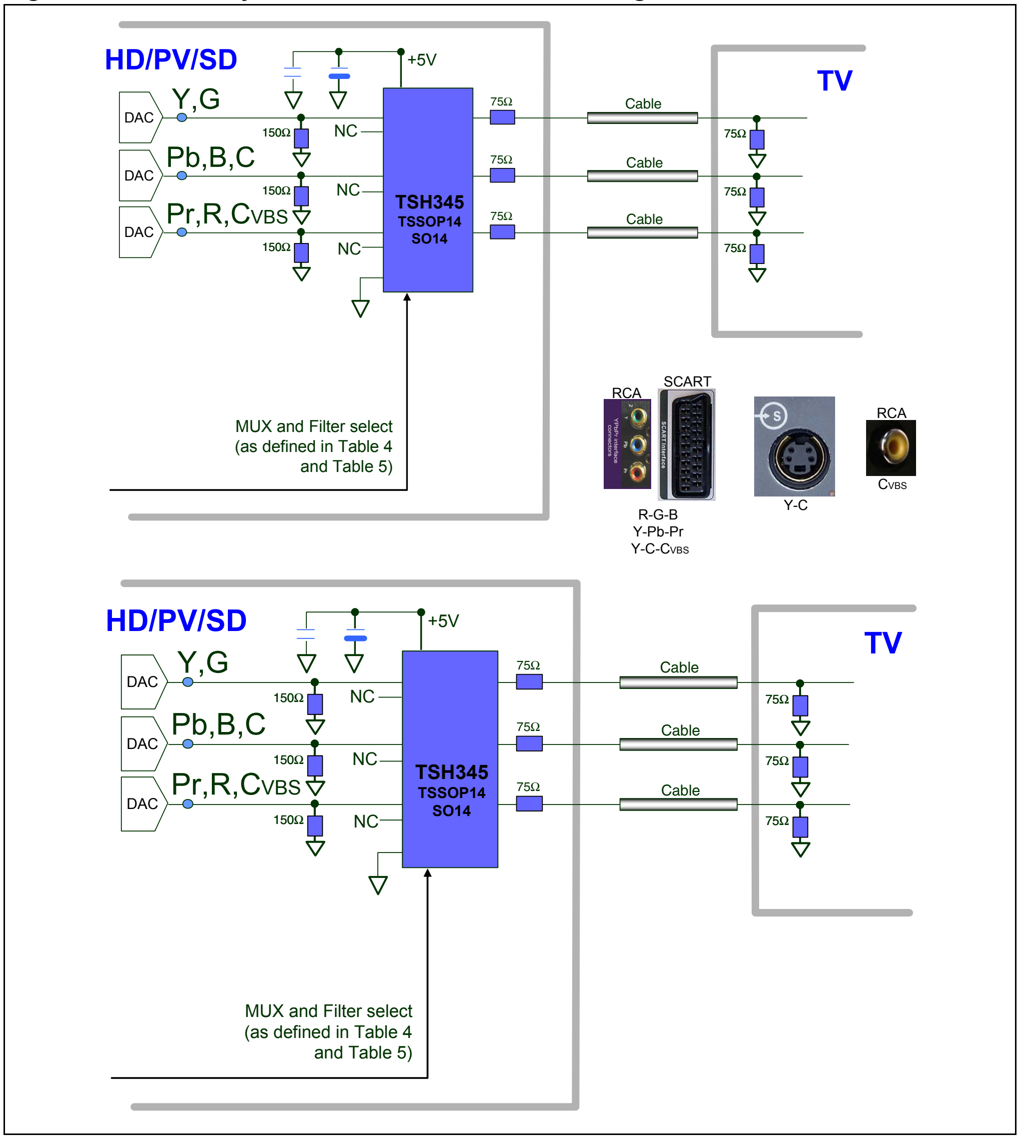

The TSH345 is used to drive either high-definition video signals up to 30 MHz or progressive and interlaced standard definition video signals on 75-Ω video lines. It can drive a large panel of signals such as YC and CVBS, YUV, YPbPr and RGB, where the bottom of the signal (the synchronization tip in the case of Y and CVBS signals) is close to zero volts. An internal input DC value is added to the video signal in order to shift the bottom from GND.

The shift is not based on the average of the signal, but is an analog summation of a DC component to the video signal. Therefore, no input capacitors are required, which provides a real advantage in terms of cost and board space.

Under these conditions, it is possible to drive the signal in single supply without any saturation of the driver against the lower rail.

Since half of the signal is lost through output impedance matching, in order to properly drive the video line the shifted signal is multiplied by a gain of 2 or +6 dB.

3.1 Output capacitor

The output can be either DC-coupled or AC-coupled. The output can be directly connected to the line via a 75-Ω resistor (see *Figure 34*), or an output capacitor can be used to remove any DC components in the load. Assuming the load is 150 Ω, a coupling capacitor of 220 µF can be used to provide a very low cut-off frequency close to 5 Hz (see *Figure 35*).

Figure 34. DC output coupling for SD, PV and HD

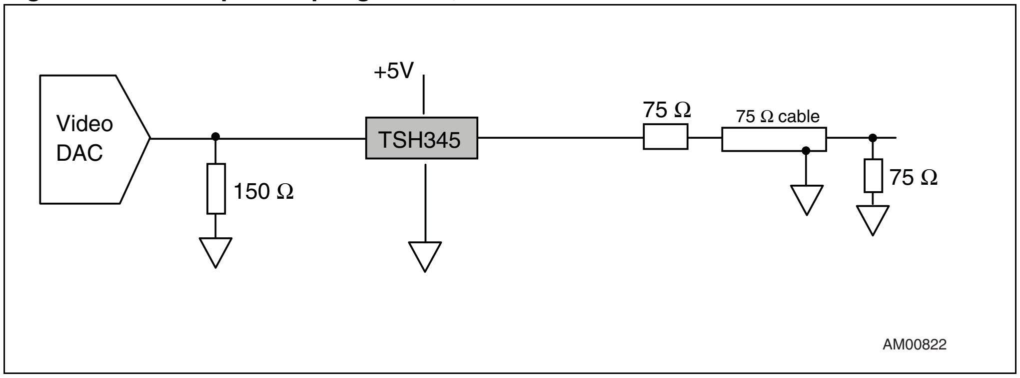

Figure 35. AC output coupling

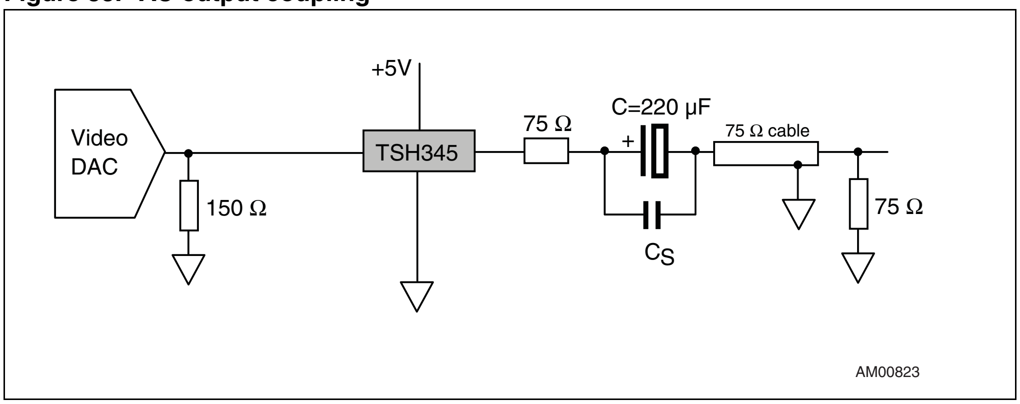

1. C_S is 100 nF used to decrease the parasitic components of C in high frequencies. It is preferable to limit the use of this output AC-coupling to the standard definition only.
2. The 75-Ω resistor must be as close as possible to the output of the driver to minimize the effect of parasitic capacitance.

4 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.
