

4-bit constant current power-LED sink driver

Features

- 4 constant current output channels
- Adjustable output current through one external resistor
- Can be driven by a 3.3 V microcontroller
- Serial data IN/parallel data OUT
- Output current: 80-400 mA
- 20 V of output driving capability
- 30 MHz clock frequency
- UVLO (under voltage lockout) and POR (power ON reset)
- TSD, thermal shutdown, output off when junction temperature exceeds limit
- Operating free-air temperature range -40° to 125 °C
- ESD protection 2.5 kV HBM, 200 V MM
- Available in high thermal TSSOP exposed pad.

Description

The STP04CM05 is a high-power LED driver and 4-bit shift register designed for Power-LED applications.

The STP04CM05 contains a 4-bit serial IN, parallel OUT shift register that feeds a 4-bit D-type storage register. In the output stage, four regulated current sources were designed to provide 80-400 mA constant current to drive high power LEDs.

The STP04CM05 guarantees 20 V output driving capability, allowing users to connect more LEDs in series. The high clock frequency, 30 MHz, also satisfies the system requirements which include high volume data transmission.

The STP04CM05 is well suited for very high brightness displays and special lighting applications.

The STP04CM05 is offered in SO-14 and TSSOP16 exposed pad packages.

3 Maximum rating

Stressing the device above the rating listed in the “absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

- Note:
- 1 Latch and output enable are level sensitive and are not synchronized with rising-or-falling edge of CLK signal.
 - 2 When LE terminal is low level, the latch circuit hold previous set of data.
 - 3 When LE terminal is high level, the latch circuit refresh new set of data from SDI chain.
 - 4 When OE terminal is at low level, the output terminal - Out 0 to Out 03 respond to data in the latch circuits, either '1' for ON or '0' for OFF.
 - 5 When OE terminal is at high level, all output terminals will be switched OFF.
