

Low voltage 8-bit constant current LED sink with full outputs error detection

Features

- Low voltage power supply down to 3 V
- 8 constant current output channels
- Adjustable output current through external resistor
- Short and open output error detection
- Serial data IN/parallel data OUT
- 3.3 V micro driver-able
- Output current: 5-100 mA
- 30 MHz clock frequency
- Available in high thermal efficiency TSSOP exposed pad
- ESD protection 2.5 kV HBM, 200 V MM

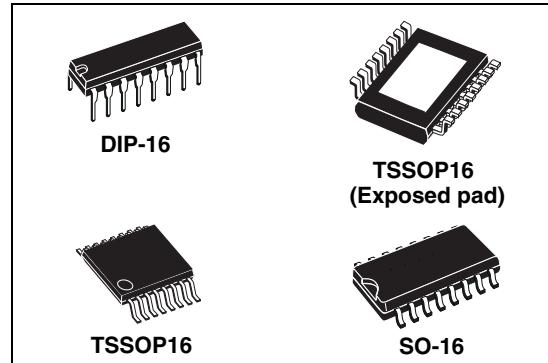

Description

The STP08DP05 is a monolithic, low voltage, low current power 8-bit shift register designed for LED panel displays. The STP08DP05 contains a 8-bit serial-in, parallel-out shift register that feeds a 8-bitD-type storage register. In the output stage, eight regulated current sources were designed to provide 5-100 mA constant current to drive the LEDs.

The STP08DP05 is backward compatible in the functionality and footprint with STP8C/L596 and extends its functionality with open and short detection on the outputs. The detection circuit checks 3 different conditions that can occur on the output line: short to GND, short to V_O or open line.

Table 1. Device summary

Order codes	Package	Packaging
STP08DP05B1R	DIP-16	25 parts per tube
STP08DP05MTR	SO-16 (Tape and reel)	2500 parts per reel
STP08DP05TTR	TSSOP16 (Tape and reel)	2500 parts per reel
STP08DP05XTTR	TSSOP16 exposed-pad (Tape and reel)	2500 parts per reel

The data detection results are loaded in the shift register and shifted out via the serial line output.

The detection functionality is implemented without increasing the pin number, through a secondary function of the output enable and latch pin (DM1 and DM2 respectively), a dedicated logic sequence allows the device to enter or leave from detection mode. Through an external resistor, users can adjust the STP08DP05 output current, controlling in this way the light intensity of LEDs, in addition, user can adjust LED's brightness intensity from 0% to 100% via OE/DM2 pin.

The STP08DP05 guarantees a 20 V output driving capability, allowing users to connect more LEDs in series. The high clock frequency, 30 MHz, also satisfies the system requirement of high volume data transmission. The 3.3 V of voltage supply is well useful for applications that interface any micro from 3.3 V. Compared with a standard TSSOP package, the TSSOP exposed pad increases heat dissipation capability by a 2.5 factor.

3 Maximum rating

Stressing the device above the rating listed in the “absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

3.1 Absolute maximum ratings

Table 4. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{DD}	Supply voltage I_{GND}	0 to 7	V
V_O	Output voltage	-0.5 to 20	V
I_O	Output current	100	mA
I_{GND}	GND terminal current	800	mA
f_{CLK}	Clock frequency	50	MHz

9 Test circuit

Figure 14. DC characteristics

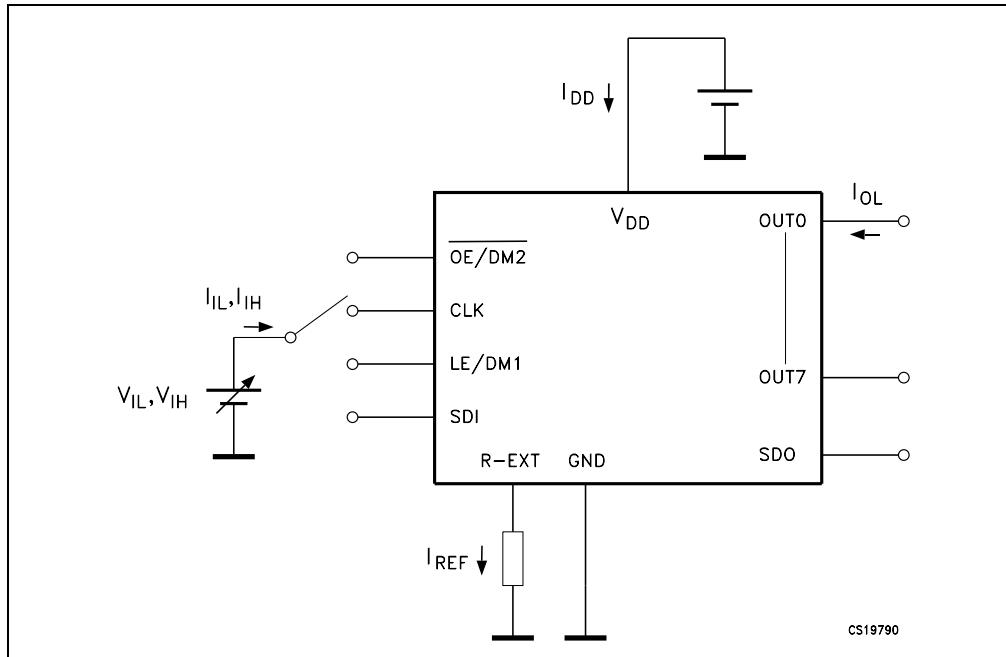

Figure 15. AC characteristics

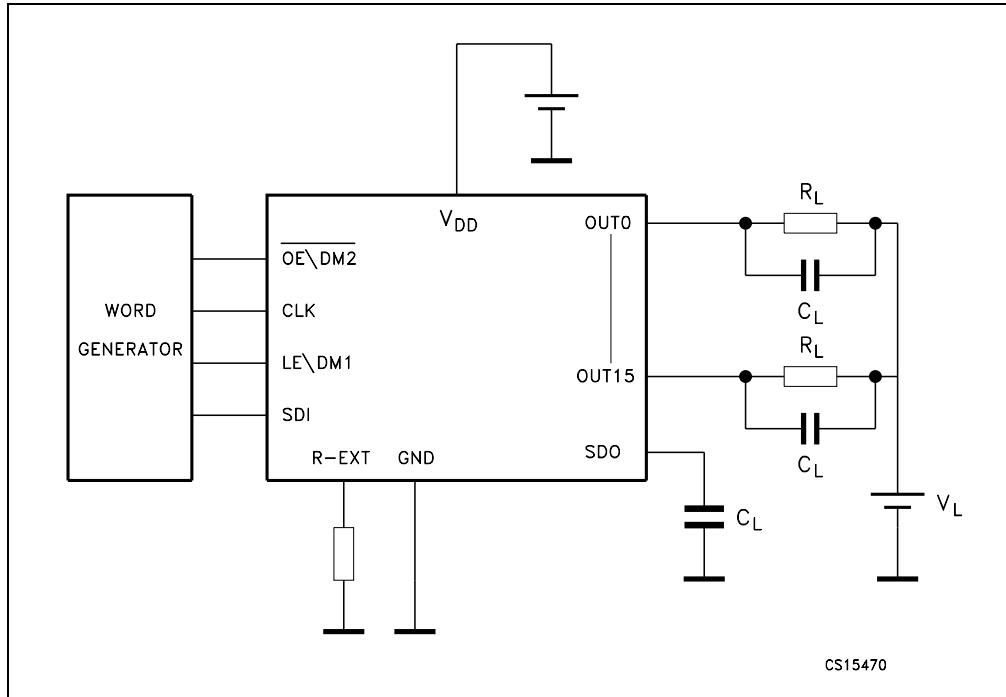

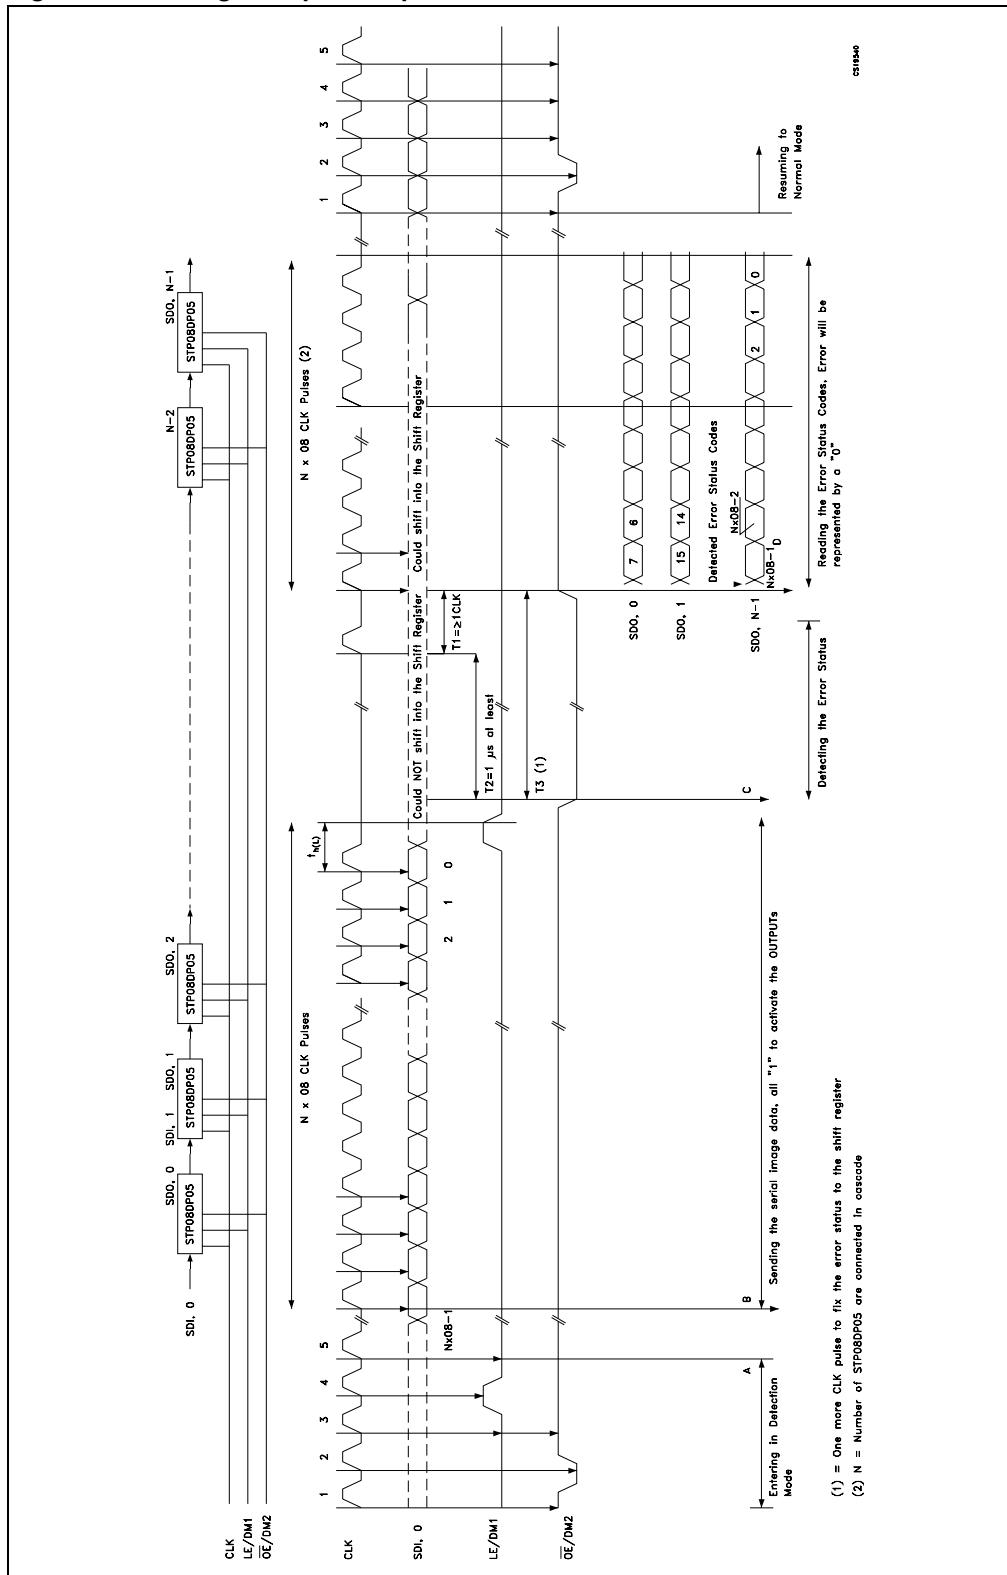

Figure 16. Timing example for open and/or short detection

10 Detection mode functionality

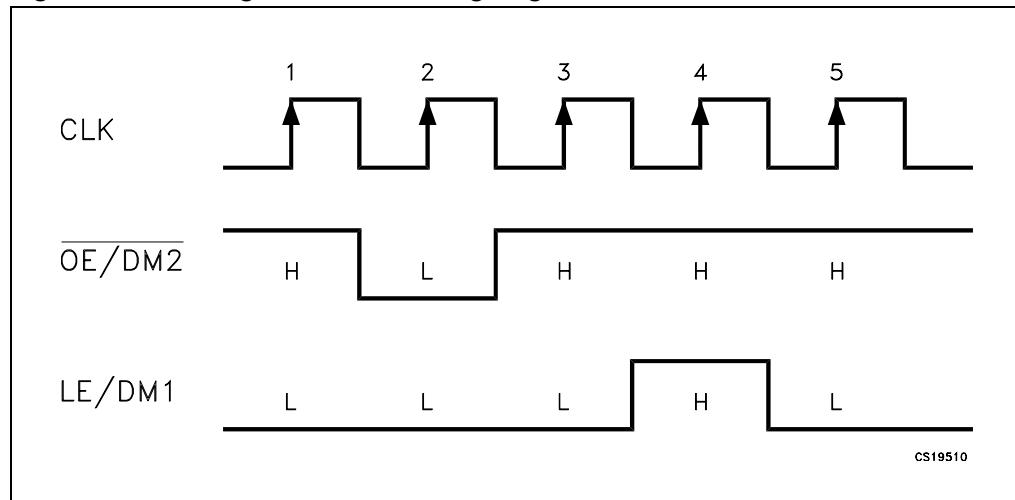

10.1 Phase one: “entering in detection mode“

From the “normal mode” condition the device can switch to the “error mode” by a logic sequence on the OE/DM2 and LE/DM1 pins as showed in the following table and diagram:

Table 12. Entering in detection truth table

CLK	1°	2°	3°	4°	5°
<u>OE/DM2</u>	H	L	H	H	H
LE/DM1	L	L	L	H	L

Figure 17. Entering in detection timing diagram

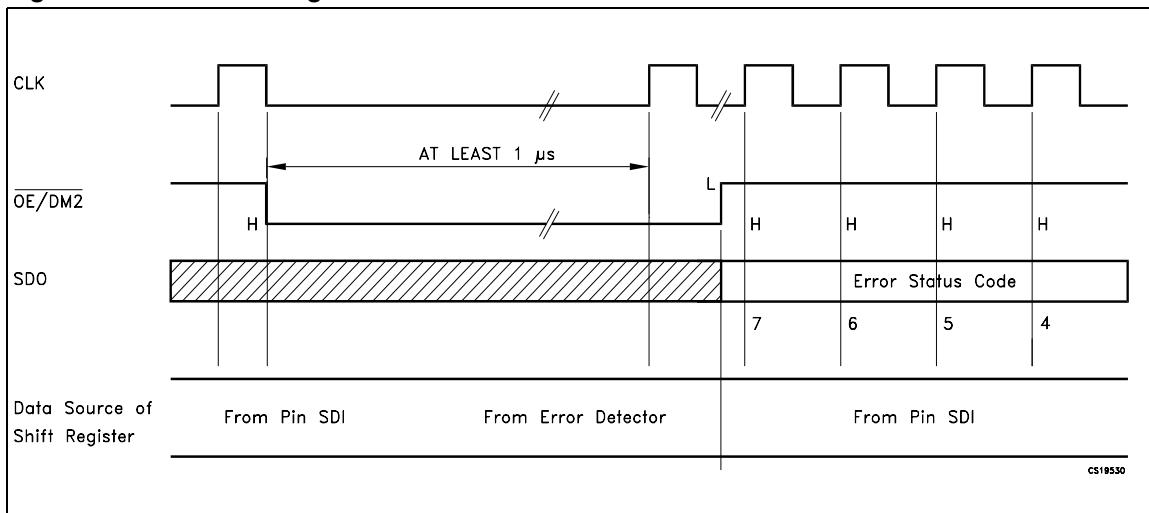

After these five CLK cycles the device goes into the “error detection mode” and at the 6th rise front of CLK the SDI data are ready for the sampling.

10.2 Phase two: “error detection”

The eight data bits must be set “1” in order to set ON all the outputs during the detection. The data are latched by LE/DM1 and after that the outputs are ready for the detection process. When the micro controller switches the $\overline{OE}/\overline{DM2}$ to LOW, the device drives the LEDs in order to analyze if an OPEN or SHORT condition has occurred.

Figure 18. Detection diagram

The LEDs status will be detected at least in 1 microsecond and after this time the microcontroller sets $\overline{OE}/\overline{DM2}$ in HIGH state and the output data detection result will go to the microprocessor via SDO.

Detection mode and normal mode use both the same format data. As soon as all the detection data bits are available on the serial line, the device may go back to normal mode of operation. To re-detect the status the device must go back in normal mode and re-entering in error detection mode.

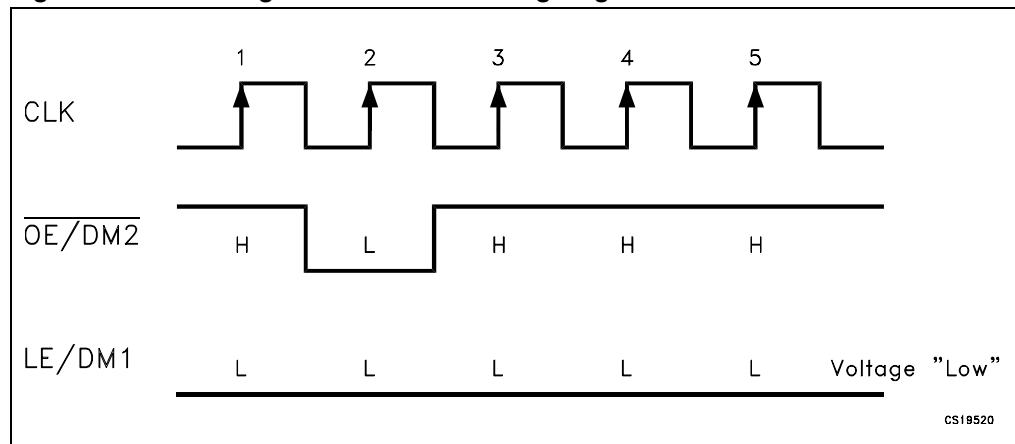

10.3 Phase three: “resuming to normal mode”

The sequence for re-entering in normal mode is showed in the following table and diagram:

Table 13. Resuming to normal mode timing diagram

CLK	1°	2°	3°	4°	5°
OE/DM2	H	L	H	H	H
LE/DM1	L	L	L	L	L

Figure 19. Resuming to normal mode timing diagram

Note: For proper device operation the “entering in detection” sequence must be follow by a “resume mode” sequence, isn’t possible to insert consecutive equal sequence.

10.4 Error detection conditions

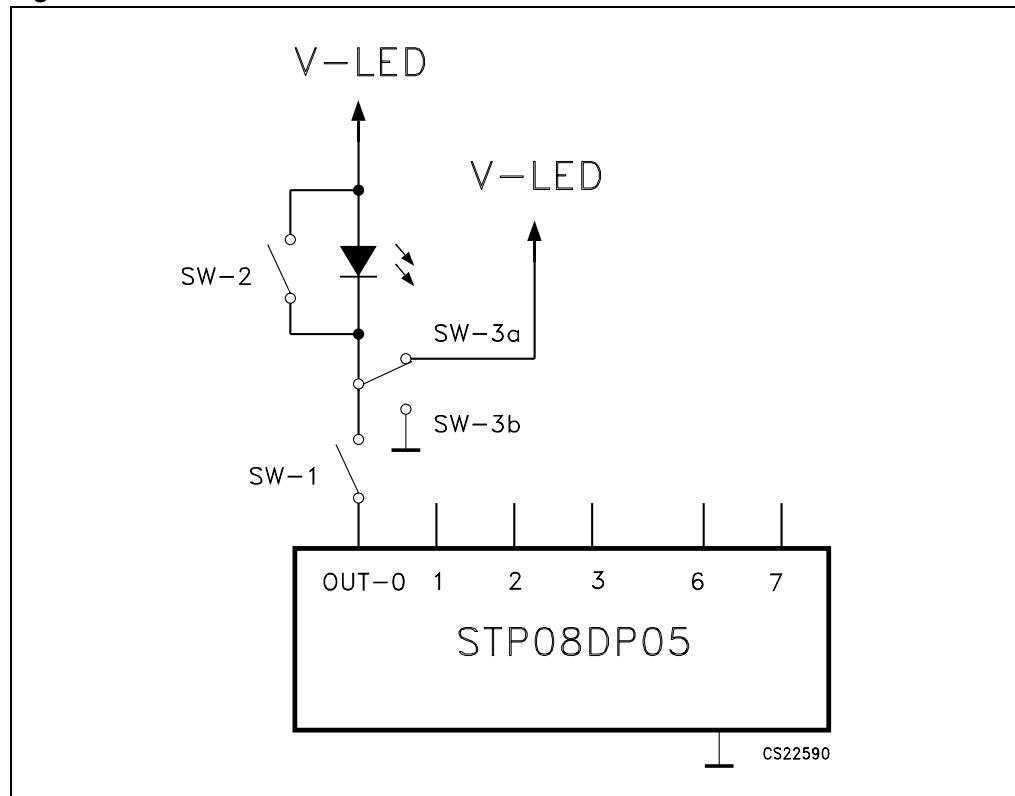

$V_{DD} = 3.3$ to 5 V temperature range 25 °C.

Table 14. Detection condition

SW-1 or SW-3b	Open line or output short to GND detected	$\Rightarrow I_{ODEC} \leq 0.5 \times I_O$	No error detected	$\Rightarrow I_{ODEC} \geq 0.5 \times I_O$
SW-2 or SW-3a	Short on LED or short to V-LED detected	$\Rightarrow V_O \geq 2.5$ V	No error detected	$\Rightarrow V_O \leq 2.2$ V

Note: Where: I_O = the output current programmed by the R_{EXT} ,
 I_{ODEC} = the detected output current in detection mode.

Figure 20. Detection circuit

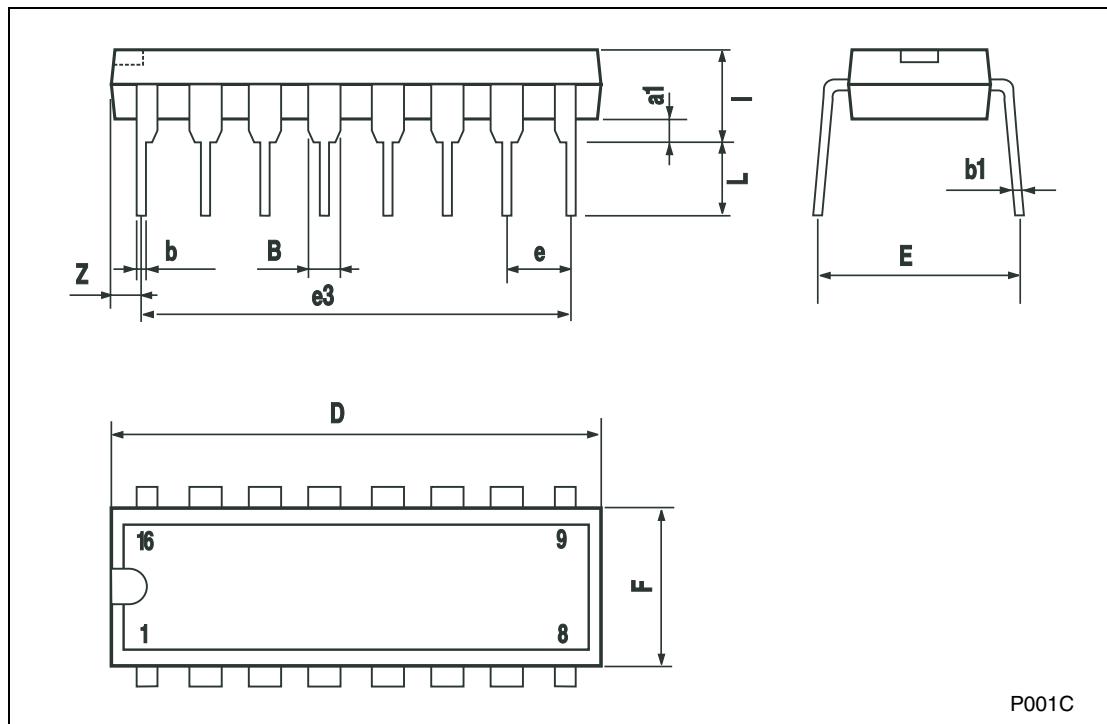

11 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com.
