

SC70, Low-Power, General-Purpose, Dual-Supply, Rail-to-Rail Op Amps

General Description

The MAX4493/MAX4494/MAX4495 single/dual/quad general-purpose operational amplifiers are designed for use in systems powered with dual supplies from $\pm 2.25\text{V}$ to $\pm 5.5\text{V}$ or with a single supply of $+4.5\text{V}$ to $+11\text{V}$. These op amps provide a unity-gain bandwidth of 5MHz with only $770\mu\text{A}$ of quiescent current per amplifier. The wide input common-mode range extends from 200mV beyond the negative rail to within 1.5V of the positive supply rail while the output swings within 10mV ($R_L = 100\text{k}\Omega$) of either rail.

These amplifiers have excellent (110dB) open-loop gain with very low THD+N of 0.002% ($f = 1\text{kHz}$). The single MAX4493 is available in a tiny 5-pin SC70 package and the dual MAX4494 is available in the space-saving 8-pin SOT23. The quad MAX4495 is available in both 14-pin TSSOP and 14-pin SO packages. All products are rated at the automotive temperature range of -40°C to $+125^\circ\text{C}$.

Applications

Battery-Powered Systems
DAC Output Amplifiers
Industrial Control Systems
Voltage Reference Generators
Signal Conditioning

Features

- ◆ $770\mu\text{A}$ Supply Current per Amplifier
- ◆ Operates from Dual $\pm 2.25\text{V}$ to $\pm 5.5\text{V}$ Supplies
- ◆ 5MHz Gain-Bandwidth Product
- ◆ Rail-to-Rail Output Swing
- ◆ Input Voltage Range Extends 200mV Below the Negative Rail
- ◆ 110dB Open-Loop Gain ($R_L = 100\text{k}\Omega$)
- ◆ Low THD+N of 0.002% ($f = 1\text{kHz}$)
- ◆ No Phase Reversal for Overdriven Inputs
- ◆ Unity-Gain Stable
- ◆ Available in Space-Saving Packages
 - 5-Pin SC70 (MAX4493)
 - 8-Pin SOT23 (MAX4494)
 - 14-Pin TSSOP (MAX4495)

Applications Information

Rail-to-Rail Output Stage

The MAX4493/MAX4494/MAX4495 output stage can drive up to 1kΩ and still swing within 200mV of the rails.

Capacitive-Load Stability

Driving large capacitive loads can cause instability in many op amps. The MAX4493/MAX4494/MAX4495 are

stable with capacitive loads up to 300pF. The Capacitive-Load Stability graph in the *Typical Operating Characteristics* gives the stable operation region for capacitive versus resistive load. Stability with higher capacitive loads can be improved by adding an isolation resistor in series with the op-amp output, as shown in Figure 1. This resistor improves the circuit's phase margin by isolating the load capacitor from the amplifier's output. As seen in the *Typical Operating Characteristics*, driving capacitive loads with an isolation resistor exhibits some overshoot, but no oscillation.

Figure 1. Capacitive Load Driving Circuit

Full-Power Bandwidth

The FPBW is given by:

$$FPBW(\text{Hz}) = \frac{SR}{\pi [V_{OUTp-p}(\text{max})]}$$

SC70, Low-Power, General-Purpose, Dual-Supply, Rail-to-Rail Op Amps

where the slew rate (SR) is $3\text{V}/\mu\text{s}$. Figure 2 shows the full-power bandwidth as a function of the peak-to-peak AC output voltage.

Power-Up Conditions

The MAX4493/MAX4494/MAX4495 typically settle within $3\mu\text{s}$ after power-up. See Power-Up Time in *Typical Operating Characteristics*.

Power Supplies and Layout

The MAX4493/MAX4494/MAX4495 operate with dual supplies from $\pm 2.25\text{V}$ to $\pm 5.5\text{V}$. Bypass both V_{CC} and V_{EE} with their own $0.1\mu\text{F}$ capacitor to ground.

Good layout technique helps optimize performance by decreasing the amount of stray capacitance at the op amp's inputs and outputs. To decrease stray capacitance, minimize trace lengths by placing external components close to the op amp's pins.
