

## 2.7–5.5V Serial Infrared Transceiver Module Family (SIR, 115.2 kbit/s)

### Features

- Compliant to IrDA 1.2 (up to 115.2 kbit/s)
- Wide Operating Voltage Range (2.7 to 5.5 V)
- Low Power Consumption (1.3 mA Supply Current)
- Power Sleep Mode Through  $V_{CC1}$ /SD Pin (5 nA Sleep Current)
- Long Range (up to 3.0 m at 115.2 kbit/s)
- Three Surface Mount Package Options
  - Universal (9.7 x 4.7 x 4.0 mm)
  - Side View (13.0x5.95x5.3mm)
  - Top View (13.0x7.6x5.95mm)
- BabyFace (Universal) Package Capable of Surface Mount Solderability to Side- and Top-View Orientation
- Directly Interfaces with Various Super I/O and Controller Devices and TEMIC's TOIM3000 and TOIM3232 I/Os
- Few External Components Required
- Backward Compatible to All TEMIC SIR Infrared Transceivers
- Built-in EMI Protection – No External Shielding Necessary

### Applications

- Notebook Computers, Desktop PCs, Palmtop Computers (Win CE, Palm PC), PDAs
- Digital Still and Video Cameras
- Printers, Fax Machines, Photocopiers, Screen Projectors
- Telecommunication Products (Cellular Phones, Pagers)
- Internet TV Boxes, Video conferencing systems
- External Infrared Adapters (Dongles)
- Medical and Industrial Data Collection Devices

### Description

The TFDU4100, TFDS4500, and TFDT4500 are a family of low-power infrared transceiver modules compliant to the IrDA 1.2 standard for serial infrared (SIR) data communication, supporting IrDA speeds up to 115.2 kbit/s. Integrated within the transceiver modules are a photo PIN diode, infrared emitter (IRED), and a low-power analog control IC to provide a total front-end solution in a single package. TEMIC's SIR transceivers are available in three package options, including our BabyFace package (TFDU4100), the smallest SIR transceiver available on the market. This wide selection

provides flexibility for a variety of applications and space constraints.

The transceivers are capable of directly interfacing with a wide variety of I/O chips which perform the pulse-width modulation/demodulation function, including TEMIC's TOIM3000 and TOIM3232. At a minimum, a current-limiting resistor in series with the infrared emitter and a  $V_{cc}$  bypass capacitor are the only external components required to implement a complete solution.

## Functional Block Diagram

## Pin Assignment and Description

Pin Number		Function	Description	I/O	Active
"U", "T" Option	"S" Option				
1	8	IRED Anode	IRED anode, should be externally connected to $V_{CC2}$ through a current control resistor		
2	1	IRED Cathode	IRED cathode, internally connected to driver transistor		
3	7	Txd	Transmit Data Input	I	HIGH
4	2	Rxd	Received Data Output, push-pull CMOS driver output capable of driving a standard CMOS or TTL load. No external pull-up or pull-down resistor is required (20 k $\Omega$ resistor internal to device). Pin is inactive during transmission.	O	LOW
5	6	NC	Do not connect		
6	3	$V_{CC1}/SD$	Supply Voltage/Shutdown (see "Shutdown" on page 6)		
7	5	SC	Sensitivity control	I	HIGH
8	4	GND	Ground

## Ordering Information

Part Number	Qty/ Reel	Description
TFDU4100-TR3	1000 pcs	Oriented in carrier tape for side view surface mounting
TFDU4100-TT3	1000 pcs	Oriented in carrier tape for top view surface mounting
TFDS4500-TR3	750 pcs	
TFDT4500-TR3	750 pcs	

## Absolute Maximum Ratings

Parameter	Symbol	Test Conditions <sup>a</sup>	Min <sup>b</sup>	Typ <sup>c</sup>	Max <sup>b</sup>	Unit
Supply Voltage Range	V <sub>CC1</sub>		-0.5		6	V
Voltage Range of IRED Drive Output	V <sub>CC2</sub>	IRED anode pin, T <sub>x</sub> d LOW	-0.5		6	
Input Currents <sup>d</sup>					10	mA
Output Sink Current					25	
Power Dissipation <sup>e</sup>	P <sub>D</sub>				200	mW
Junction Temperature	T <sub>J</sub>				125	°C
Ambient Temperature Range (Operating)	T <sub>amb</sub>		-25		85	
Storage Temperature Range	T <sub>stg</sub>		-25		85	
Soldering Temperature		t = 20 s		215	240	
Average IRED Current	I <sub>IRED</sub> (DC)				100	mA
Repetitive Pulsed IRED Current	I <sub>IRED</sub> (RP)	t < 90µs, t <sub>on</sub> <20%			500	
IRED Anode Voltage at Current Output	V <sub>IRED A</sub>		-0.5		6	V
Transmitter Data Input Voltage	V <sub>Txd</sub>		-0.5		V <sub>cc</sub> + 0.5	
Receiver Data Output Voltage	V <sub>Rxd</sub>		-0.5		V <sub>cc</sub> + 0.5	
Virtual Source Size <sup>f</sup>	d		2.5	2.8		mm
Maximum Intensity for Class 1 Operation of IEC 825 or EN60825 <sup>g</sup>		EN60825, 1997			400	mW/sr

### Notes

- Reference point GND pin unless otherwise noted.
- The algebraic convention whereby the most negative value is a minimum and the most positive a maximum.
- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
- All pins except IRED cathode pin and IRED anode pin.
- See Derating Curve
- Method: (1-1/e) encircled energy.
- Worst case IrDA SIR pulse pattern.

## Electrical Characteristics

Parameter	Symbol	Test Conditions <sup>a</sup>	Min <sup>b</sup>	Typ <sup>c</sup>	Max <sup>b</sup>	Unit
<b>Transceiver</b>						
Supply Voltage	V <sub>CC1</sub>	Receive Mode	2.7		5.5	V
Supply Voltage	V <sub>CC1</sub>	Transmit Mode, R <sub>2</sub> = 51 Ω	2.0		5.5	
Supply Current, V <sub>CC1</sub> Pin (Receive Mode)	I <sub>S</sub>	V <sub>CC1</sub> = 5.5V		1.3	2.5	mA
		V <sub>CC1</sub> = 2.7V		1.0	1.5	
Supply Current, V <sub>CC1</sub> Pin (avg) (Transmit Mode) <sup>d</sup>	I <sub>S</sub>	V <sub>CC1</sub> = 5.5V		5.0	5.5	
		V <sub>CC1</sub> = 2.7V		3.5	4.5	
Leakage Current of IR Emitter, IRED Anode Pin	I <sub>S</sub>	V <sub>CC1</sub> = OFF, T <sub>xd</sub> = LOW, V <sub>CC2</sub> = 6V, T = 25°–85° C		0.005	0.5	μA

### Notes

- $T_{amb} = 25^\circ C$ ,  $V_{CC} = 2.7 - 5.5 V$  unless otherwise noted.
- The algebraic convention whereby the most negative value is a minimum and the most positive a maximum.
- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
- IRED Operating Current can be adjusted by variation of  $R_1$
- In agreement with IEC 825 eye safety limit

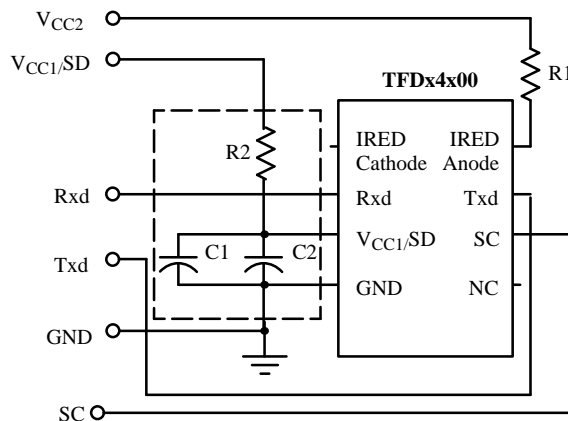

## Recommended Circuit Diagram

The only required components for designing an IrDA 1.2 compatible design using TEMIC SIR transceivers are a current limiting resistor to the IRED. However, depending on the entire system design and board layout, additional components may be required (see Figure 1).

It is recommended that the capacitors C1 and C2 are positioned as near as possible to the transceiver power supply pins, as in the proposed layout in Figure 1. A tantalum capacitor should be used for C1, while a ceramic capacitor should be used for C2 to suppress RF noise. Also, when connecting the described circuit to the power supply, low impedance wiring should be used.

$R_1$  is used for controlling the current through the IR emitter. For increasing the output power of the IRED, the value of the resistor should be reduced. Similarly, to reduce the output power of the IRED, the value of the resistor should be increased. For typical values of  $R_1$  see Fig 2. For IrDA compliant operation, a current control resistor of 8–12  $\Omega$  is recommended. The upper drive current limitation is dependent on the duty cycle and is

given by the absolute maximum ratings on the data sheet and the eye safety limitations given by IEC825–1.

Note: Outlined components are optional depending on quality of power supply.

Figure 1. Recommended Application Circuit

$R_2$ , C1 and C2 are optional and dependent on the quality of the supply voltage  $V_{CC1}$  and injected noise. An

unstable power supply with dropping voltage during transmission may reduce sensitivity (and transmission range) of the transceiver.

**Table 1.** Recommended Application Circuit Components

Component	Recommended Value
C1	100 nF, Ceramic (use 470 nF for less stable power supplies)
C2	1 $\mu$ F, Tantalum
R1	8.2 $\Omega$ , 0.25 W (recommend using two 0.125 W resistors in parallel)
R2	22 – 47 $\Omega$ , 0.125 W

The sensitivity control (SC) pin allows the minimum detection irradiance threshold of the transceiver to be lowered when set to a logic HIGH. Lowering the irradiance threshold increases the sensitivity to infrared signals and increases transmission range up to 3 meters. However, setting the SC pin to logic HIGH also makes the transceiver more susceptible to transmission errors due to an increased sensitivity to fluorescent light disturbances. It is recommended to set the SC pin to logic LOW or left open if the increased range is not required or if the system will be operating in bright ambient light.

The guide pins on the side-view and top-view packages are internally connected to ground but should not be connected to the system ground to avoid ground loops. They should be used for mechanical purposes only and should be left floating.

**Figure 2.**  $I_e$  vs  $R_1$

## Shutdown

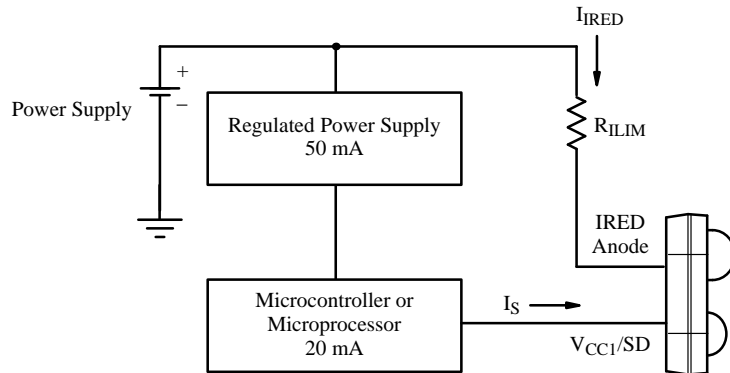

The internal switch for the IRED in TEMIC SIR transceivers is designed to be operated like an open collector driver. Thus, the  $V_{CC2}$  source can be an unregulated power supply while only a well regulated power source with a supply current of 1.3 mA connected to  $V_{CC1}/SD$  is needed to provide power to the remainder of the transceiver circuitry in receive mode. In transmit mode, this current is slightly higher (approximately 4 mA average at 3V supply current) and the voltage is not required to be kept as stable as in receive mode. A voltage drop of  $V_{CC1}$  is acceptable down to about 2.2V when buffering the voltage directly from the  $V_{CC1}$  pin to GND by a 470 nF ceramic capacitor (C1) and a 51  $\Omega$  serial resistor (R2) is used (see figure 1).

This configuration minimizes the influence of high current surges from the IRED on the internal analog control circuitry of the transceiver and the application circuit. Also, board space and cost savings can be achieved by eliminating the additional linear regulator normally needed for the IRED's high current requirements.

The transceiver can be very efficiently shutdown by keeping the IRED connected to the power supply  $V_{CC2}$  but switching off  $V_{CC1}/SD$ . The power source to  $V_{CC1}/SD$  can be provided directly from a microcontroller (see Figure 3). In shutdown, current loss is realized only as leakage current through the current limiting resistor to the IRED (typically, 5 nA). The settling time after switching  $V_{CC1}/SD$  on again is approximately 50  $\mu$ s. TEMIC's TOIM3232 interface circuit is designed for this shutdown feature. The  $V_{CC\_SD}$ , S0 or S1 outputs on the TOIM3232 can be used to power the transceiver with the necessary supply current.

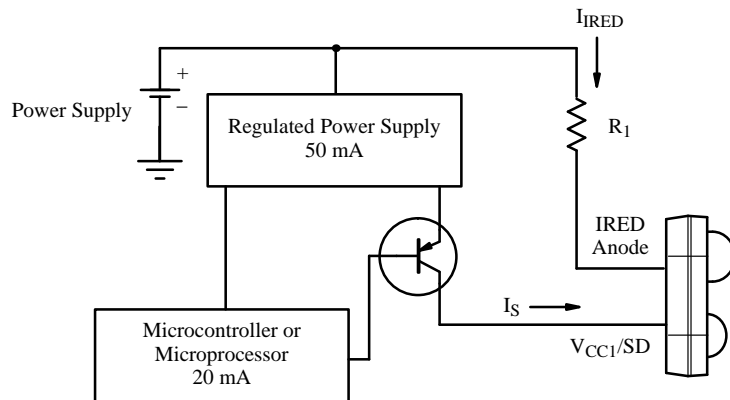

If the microcontroller or the microprocessor is unable to drive the 1.3-mA supply current required by the transceiver, a low-cost SOT-23 pnp transistor can be used to switch voltage on and off from the regulated power supply (see figure 4). The additional component cost is minimal and saves the system designer additional power supply costs.
