FAN6749 Highly Integrated Ultra Green-Mode PWM Controller

Features

- High-Voltage Startup
- Low Operating Current: 1.8mA
- Linearly Decreasing PWM Frequency to 24kHz
- Proprietary Asynchronous Jitter to Reduce EMI
- Two-Level Over-Current Protection (OCP), 1400ms Delay for Normal Peak Load
- Two-Level OCP, 56ms Delay for Super Peak Load
- Output Short-Circuit Protection (SCP)
- Peak-Current Mode Operation with Cycle-by-Cycle Current Limiting
- HV Pin Brown-in/out Protection with Hysteresis
- Constant Power Limit by HV Sampling
- Internal FB Open-Loop Protection (OLP)
- GATE Output Maximum Voltage Clamp: 14.5V
- V_{DD} Over-Voltage Protection (OVP)
- Programmable Over-Temperature Protection (OTP)
- Integrated 6ms Soft-Start Function
- Internal Latch Circuit (OVP, OTP, OCP, OLP, SCP)
- Internal OTP Sensor with Hysteresis

Applications

General-Purpose Switched-Mode Power Supplies and Flyback Power Converters, including:

- Power Adapters
- Open-Frame SMPS; Specifically for SMPS with Surge-Current Output, such as for Printer, Scanner, Motor Drivers

Description

The FAN6749 highly integrated PWM controller enhances the performance of flyback converters. To minimize standby power consumption, a proprietary Green-Mode function continuously decreases the switching frequency under light-load conditions. Under zero-load conditions, the power supply enters Burst Mode and completely shuts off PWM output. Green Mode helps power supplies meet international power conservation requirements.

The FAN6749 is designed for SMPS with surge-current output and incorporates a two-level Over-Current Protection (OCP) function. Besides the cycle-by-cycle current limiting, two-level OCP can handle peak loading within a specified delay time.

FAN6749 also integrates a frequency-hopping function that helps reduce EMI emission of a power supply with minimum line filters. Built-in synchronized slope compensation helps achieve stable peak-current control. To keep constant output power limit over universal AC input range, the current limit and OCP threshold voltage are adjusted according to AC line voltage detected by the HV pin. Gate output is clamped at 14.5V to protect the external MOSFET from over-voltage damage.

Other protection functions include: AC input brownout protection with hysteresis, Short-Circuit Protection (SCP) for output-short condition, and V_{DD} Over-Voltage Protection (OVP). For over-temperature protection, an external NTC thermistor can be applied to sense the ambient temperature. When OLP, OCP, SCP, V_{DD} OVP, or OTP is activated, an internal latch circuit latches off the controller. The latch resets when V_{DD} is removed.

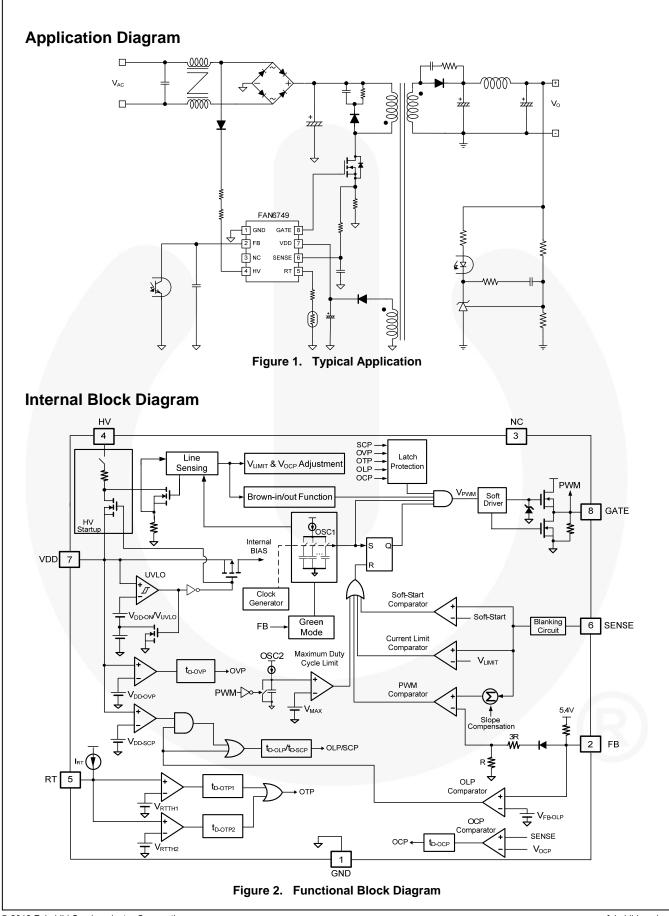

OVP	OCP	OLP	OTP	SCP
Latch	Latch	Latch	Latch	Latch

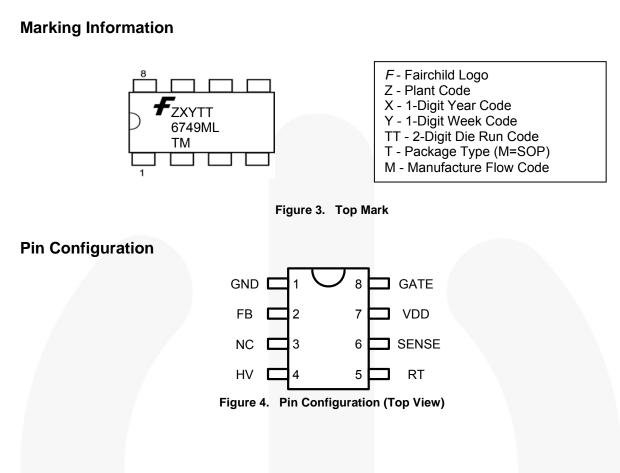

There are three differences from FAN6748 to FAN6749:

- Over-current protection debounce time is extended to 1400ms.
- Brown-out debounce time is extended to 100ms.
- No SENSE short-circuit protection function.

Ordering Information

Part Number	Operating Temperature Range	Package	Packing Method
FAN6749MLM	-40 to +105°C	8-Pin Small Outline Package (SOP)	Reel & Tape

Pin Definitions

Pin #	Name	Description
1	GND	Ground Pin. A 0.1µF decoupling capacitor between VDD and GND is recommended.
2	FB	Feedback Pin . The output voltage feedback information from the external compensation circuit is fed into this pin. The PWM duty cycle is determined by comparing the FB signal with current-sense signal from the SENSE pin.
3	NC	No connection
4	HV	High-Voltage Startup . The HV pin is typically connected to the AC line input through an external diode and a resistor (R_{HV}). This pin is used not only to charge V_{DD} capacitor during startup, but also to sense the line voltage. The line voltage information is used for brown-out protection and power limit line compensation.
5	RT	Over-Temperature Protection . An external NTC thermistor is connected from this pin to the GND pin. Once the voltage of the RT pin drops below the threshold voltage, the controller latches off the PWM. The RT pin also provides external latch protection. If the RT pin is not connected to an NTC resistor for over-temperature protection, place a $100k\Omega$ resistor to ground to prevent noise interference.
6	SENSE	Current Sense . The sensed voltage is used for peak-current-mode control, over-current protection, short-circuit protection, and cycle-by-cycle current limiting.
7	VDD	Power Supply of IC . A holdup capacitor typically connects from this pin to ground. A rectifier diode in series with the transformer auxiliary winding connects to this pin to supply bias during normal operation.
8	GATE	Gate Drive Output . The totem-pole output driver for the power MOSFET; internally limited to V _{GATE-CLAMP} .

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter		Min.	Max.	Unit
V _{DD}	DC Supply Voltage ^(1, 2)			30	V
V _{FB}	FB Pin Input Voltage		-0.3	7.0	V
V _{SENSE}	SENSE Pin Input Voltage		-0.3	7.0	V
V _{RT}	RT Pin Input Voltage		-0.3	7.0	V

PD	Power Dissipation (T _A < 50°C)			400	mW
Θ_{JA}	Thermal Resistance (Junction-to-Air)			150	°C/W
TJ	Operating Junction Temperature		-40	+125	°C
T _{STG}	Storage Temperature Range		-55	+150	°C
TL	Lead Temperature (Wave Soldering or IR, 10 Seco	onds)		+260	°C
ESD	Human Body Model ⁽³⁾ , JEDEC:JESD22-A114	All Pins Except HV Pin		6	kV
ESD	Charged Device Model ⁽³⁾ , JEDEC:JESD22-C101	All Pins Except HV Pin		2	kV

Notes:

1. All voltage values, except differential voltages, are given with respect to the network ground terminal.

2. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device.

3. ESD with the HV pin CDM=1000V and HBM=500V.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Typical Performance Characteristics

 

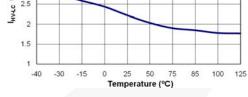

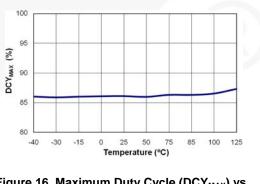

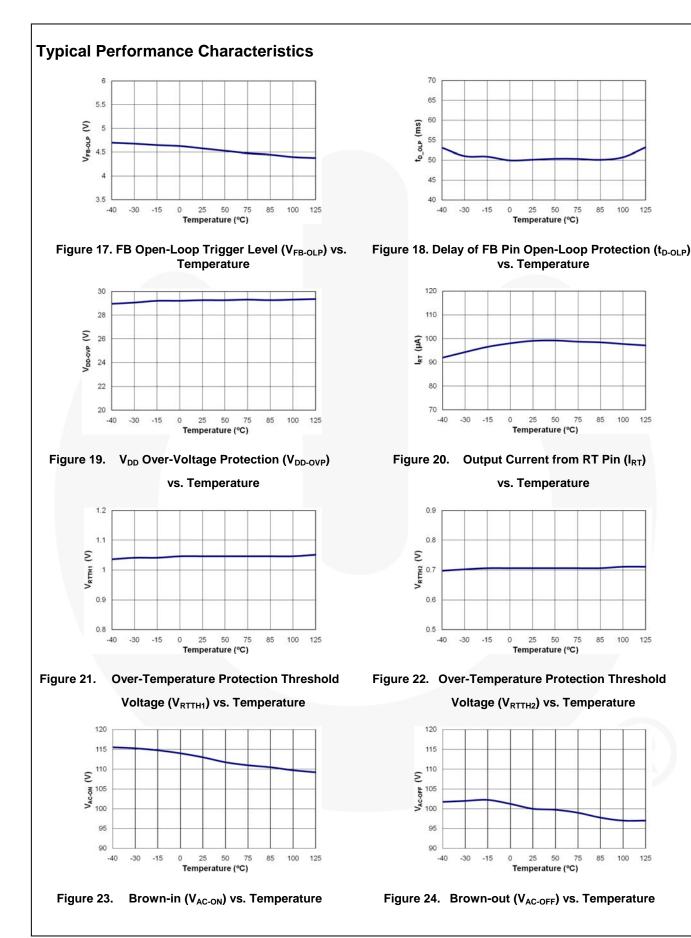

Figure 14. HV Pin Leakage Current After Startup (I_{HV-LC}) vs. Temperature

Functional Description

Current Mode Control

FAN6749 employs peak current mode control, as shown in Figure 25. An opto-coupler (such as the H11A817A) and a shunt regulator (such as the KA431) are typically used to implement the feedback network. Comparing the feedback voltage with the voltage across the R_{sense} resistor makes it possible to control the switching duty cycle. A synchronized positive slope is added to the sensed current signal to guarantee stable current mode control over wide range of input voltage. The built-in slope compensation stabilizes the current loop and prevents sub-harmonic oscillation.

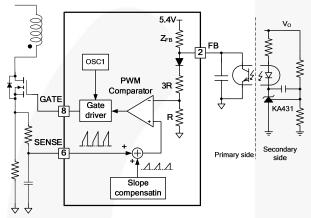

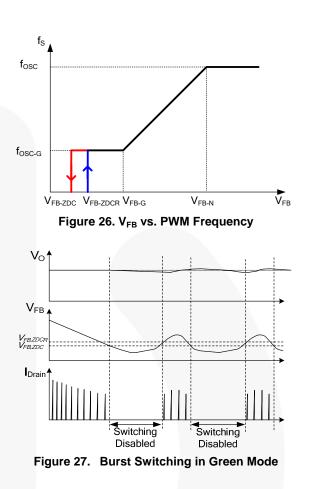

Figure 25. Current Mode Control Circuit Diagram

Green-Mode Operation

FAN6749 modulates the PWM frequency as a function of the FB voltage to improve the medium- and light-load efficiency, as shown in Figure 26. Since the output power is proportional to the FB voltage in current mode control, the switching frequency decreases as load decreases. In heavy-load conditions, the switching frequency is fixed at 65kHz. Once V_{FB} decreases below V_{FB-N} (2.7V), the PWM frequency starts linearly decreasing from 65kHz to 24kHz to reduce switching losses. As V_{FB} drops to V_{FB-G} (2.25V), where switching frequency is decreased to 24kHz, the switching frequency is fixed to avoid acoustic noise.

When V_{FB} falls below V_{FB-ZDC} (2.0V) as load decreases further, FAN6749 enters Burst Mode, where PWM switching is disabled. Then the output voltage starts to drop, causing the feedback voltage to rise. Once V_{FB} rises above $V_{FB-ZDCR}$ (2.1V), switching resumes. Burst Mode alternately enables and disables switching, thereby reducing switching loss for lower power consumption, as shown in Figure 27

Operating Current

In normal condition, operating current is around 1.8mA (I_{DD-OP1}); when V_{FB}<1.4V, operating current is further reduced to 1mA (I_{DD-OP2}) by disabling several blocks of FAN6749. The low operating current improves light-load efficiency and reduces the requirement of V_{DD} hold-up capacitance.

High-Voltage Startup and Line Sensing

The HV pin is typically connected to the AC line input through an external diode and a resistor (R_{HV}), as shown in Figure 28. When AC line voltage is applied, the V_{DD} hold-up capacitor is charged by the line voltage through the diodes and resistor. After V_{DD} voltage reaches the turn-on threshold voltage (V_{DD-ON}), the startup circuit charging V_{DD} capacitor is switched off and V_{DD} is supplied by the auxiliary winding of the transformer. Once FAN6749 starts up, it continues operation until V_{DD} drops below 6.5V (V_{UVLO}). The IC startup time with a given AC line input voltage is given as:

$$t_{STARTUP} = R_{HV} \cdot C_{DD} \cdot \ln \frac{V_{AC-IN} \cdot \frac{\sqrt{2}}{\pi}}{V_{AC-IN} \cdot \frac{\sqrt{2}}{\pi} - V_{DD-ON}}$$
(1)

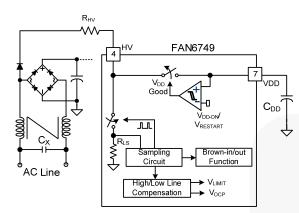

Figure 28. Startup Circuit

The HV pin detects the AC line voltage using a switched voltage divider that consists of external resistor (R_{HV}) and internal resistor (R_{LS}), as shown in Figure 28. The internal line-sensing circuit detects line voltage using a sampling circuit and a peak-detection circuit. Since the voltage divider causes power consumption when it is switched on, the switching is driven by a signal with a very narrow pulse width to minimize power loss. The sampling frequency is adaptively changed according to the load condition to minimize the power consumption in the light-load condition.

Based on the detected line voltage, brown-in and brownout thresholds are determined as:

$$V_{BROWN-IN} (RMS) = \frac{R_{HV}}{200k} \cdot \frac{V_{AC-ON}}{\sqrt{2}}$$
(2)

$$V_{BROWN-OUT} (RMS) = \frac{R_{HV}}{200k} \cdot \frac{V_{AC-OFF}}{\sqrt{2}}$$
(3)

Since the internal resistor (R_{LS} =1.62k Ω) of the voltage divider is much smaller than R_{HV} , the thresholds are given as s function of R_{HV} .

Note that V_{DD} must be larger than V_{DD-AC} to start up, even though sensed line voltage satisfies Equation 2.

High/Low Line Compensation for Constant Power Limit

FAN6749 has cycle-by-cycle current limit, as shown in Figure 29, which limits the maximum input power with a given input voltage. If the output consumes beyond this maximum power, the dropping output voltage triggers the overload protection.

As shown in Figure 29, the high/low line compensation block adjusts the current limit level, V_{LIMIT} , based on the line voltage. Figure 30 shows how the cycle-by-cycle current-limit level changes with the line voltage for different R_{HV} resistors. To maintain the constant output power limit regardless of line voltage, the cycle-by-cycle current limit level, V_{LIMIT} , decreases as line voltage increases. The current-limit level is also proportional to the R_{HV} resistor value and power limit level can be tuned using different R_{HV} resistors.

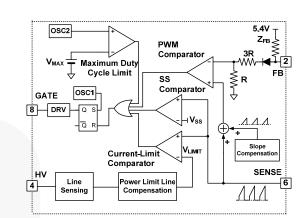

Figure 29. Cycle-by-Cycle Current-Limit Circuit

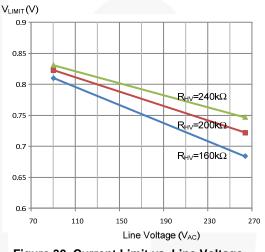

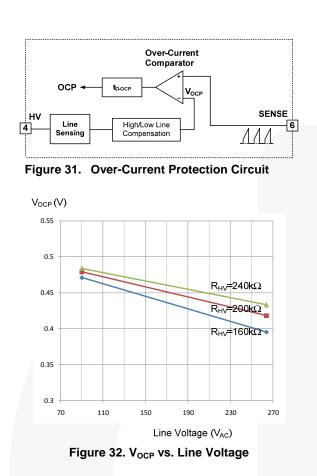

Figure 30. Current Limit vs. Line Voltage

Two-Level Over-Current Protection (OCP)

Other than cycle-by-cycle current limiting, FAN6749 applies another threshold voltage, V_{OCP} , for current sense. As shown in Figure 29, when peak of V_{SENSE} exceeds V_{OCP} at each pulse for a period of time, t_{D-OCP} ; over-current protection (OCP) is triggered. This protection is designed for applications with surge-current outputs. If a peak load is present for less than t_{D-OCP} , the controller operates as usual. If the peak load continues longer than t_{D-OCP} , GATE output is stopped to protect the converter from overload condition.

Like V_{LIMIT}, the V_{OCP} is adjusted by high/low line compensation block to maintain a constant over-current protection level, regardless of line voltage. Figure 32 shows how V_{OCP} changes with the line voltage with different R_{HV} resistors.

When OCP is triggered, it is recommended to have V_{FB} - V_{FB-N} for whole AC input range. V_{FB} - V_{FB-N} ensures switching frequency is fixed at 65kHz. If OCP is triggered in the frequency-reduction region (V_{FB} - V_{FB-N}), output current is reduced due to lower switching frequency. It causes the difference of OCP-triggering point between high and low AC input voltages.

Short Circuit Protection (SCP)

The V_{DD} voltage decreases every time the output of the power supply is shorted because the impedance at secondary windings becomes far lower than at auxiliary winding and currents choose the low-impedance path. When V_{FB} is larger than V_{FB-OLP} over a debounce time of t_{D-SCP}; if V_{DD} is lower than V_{DD-SCP}, PWM output is latched off.

Under-Voltage Lockout (UVLO)

As shown in Figure 33, as long as protection is not triggered, the turn-off threshold of V_{DD} is fixed internally at V_{UVLO} (6.5V). When a protection is triggered, the V_{DD} level to terminate PWM gate switching is changed to V_{DD-OFF} (11V), as shown in Figure 34. When V_{DD} drops below V_{DD-OFF} , the switching is terminated and the operating current from V_{DD} is reduced to I_{DD-OLP} , to slow down the discharge of V_{DD} until V_{DD} reaches V_{DD-OLP} . This delays restart after shutdown by protection to minimize the input power and voltage/current stress of switching devices during fault condition.

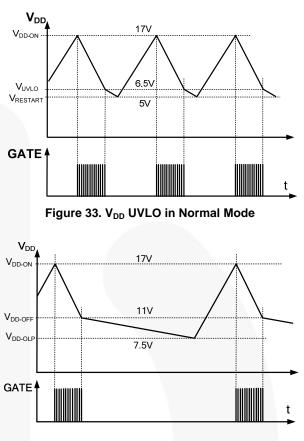

Figure 34. V_{DD} UVLO in Protection Mode

Leading-Edge Blanking (LEB)

Each time the power MOSFET is switched on, a turn-on spike occurs on the sense resistor. To avoid premature termination of the switching pulse, a leading-edge blanking time, t_{LEB} , is introduced. During this blanking period, the current-limit comparator is disabled and cannot switch off the gate driver.

Gate Output / Soft Driving

The BiCMOS output stage has a fast totem-pole gate driver. The output driver is clamped by an internal 14.5V Zener diode to protect power MOSFET gate from over voltage. A soft driving is implemented to minimize electromagnetic interference (EMI) by reducing the switching noise.

V_{DD} Over-voltage Protection (OVP)

 V_{DD} over-voltage protection prevents IC damage from over-voltage exceeding the IC voltage rating. When the V_{DD} voltage exceeds 29V, the protection is triggered. This protection is typically caused by an open circuit in the secondary-side feedback network.

Soft-Start

FAN6749 has an internal soft-start circuit that progressively increases the cycle-by-cycle current limit level of the MOSFET for 6ms during startup to establish the correct working conditions for transformers and capacitors to operate.

Over-Temperature Protection (OTP)

The RT pin provides adjustable Over-Temperature Protection (OTP) and an external latch-triggering function. For OTP application, an NTC thermistor, R_{NTC} , usually in series with a resistor, R_A , is connected between the RT pin and ground. The internal current source, I_{RT} , (100µA) introduces voltage on RT as:

$$V_{RT} = I_{RT} \cdot (R_{NTC} + R_A) \tag{4}$$

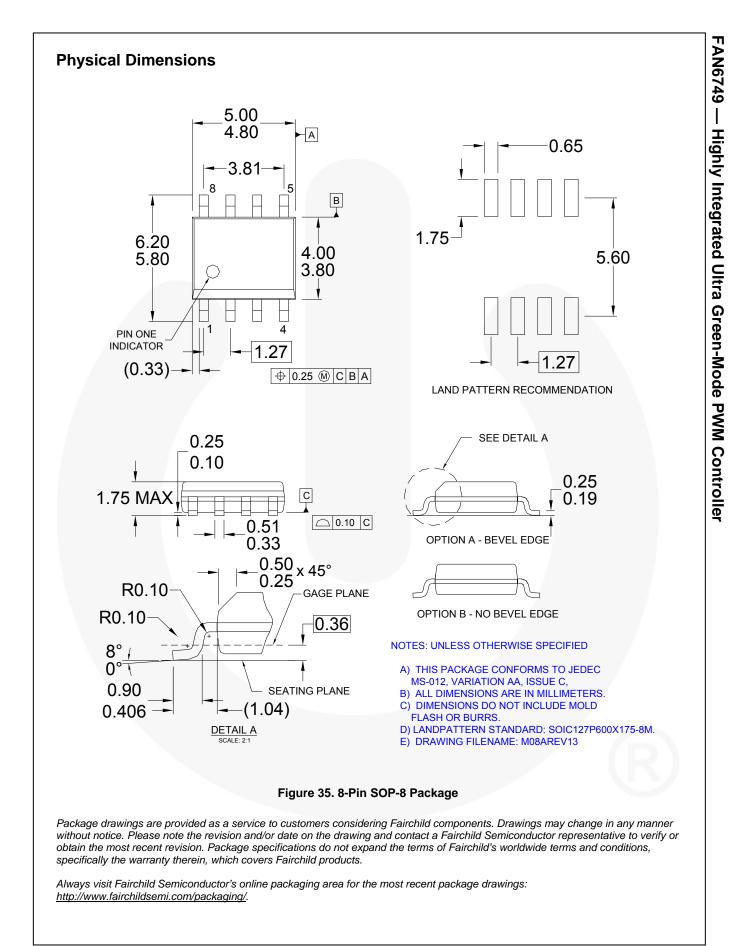

At high ambient temperature, R_{NTC} decreases, which reduces V_{RT} . When V_{RT} is lower than V_{RTTH1} (1.050V) for longer than t_{D-OTP1} (14ms), the protection is triggered and FAN6749 enters Latch Mode protection.

The OTP can be also trigged by pulling down the RT pin voltage using an opto-coupler or transistor. Once V_{RT} is less than V_{RTTH2} (0.7V) for longer than $t_{\text{D-OTP2}}$ (165µs), the protection is triggered and FAN6749 enters Latch Mode protection.

When V_{FB} falls below 1.9V, the RT pin function is disabled for lower power consumption. If OTP is not used, place a 100k Ω resistor between this pin and ground to prevent noise interference.

Noise Immunity

Noise on the current sense or control signal may cause significant pulse-width jitter, particularly in continuousconduction mode. Slope compensation helps alleviate this problem. Good placement and layout practices should be followed. Avoiding long PCB traces and component leads, locating compensation and filter components near the FAN6749, and increasing the power MOS gate resistance improve performance.

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

- 1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
- 2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

PRODUCT STATUS DEFINITIONS

Datasheet Identification	Product Status	Definition
Advance Information	Formative / In Design	Datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	Datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	Datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design.
Obsolete	Not In Production	Datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only.
