# 6W, Filterless, Spread-Spectrum Mono/Stereo Class D Amplifiers 

## General Description

The MAX9713/MAX9714 mono/stereo Class D audio power amplifiers provide Class AB amplifier performance with Class D efficiency, conserving board space and eliminating the need for a bulky heatsink. Using a Class D architecture, these devices deliver up to 6 W while offering greater than 85\% efficiency. Proprietary and patent-protected modulation and switching schemes render the traditional Class D output filter unnecessary.
The MAX9713/MAX9714 offer two modulation schemes: a fixed-frequency mode (FFM), and a spread-spectrum mode (SSM) that reduces EMI-radiated emissions due to the modulation frequency. The device utilizes a fully differential architecture, a full bridged output, and comprehensive click-and-pop suppression.
The MAX9713/MAX9714 feature high 76dB PSRR, low $0.07 \% \mathrm{THD}+\mathrm{N}$, and SNR in excess of 95dB. Short-circuit and thermal-overload protection prevent the devices from being damaged during a fault condition. The MAX9713 is available in a 32-pin TQFN ( $5 \mathrm{~mm} x$ $5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ ) package. The MAX9714 is available in a 32-pin TQFN ( $7 \mathrm{~mm} \times 7 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ ) package. Both devices are specified over the extended $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range.

## Applications

LCD Monitors High-End Notebook
LCD TVs
Desktop PCs
LCD Projectors

High-End Notebook Audio
Hands-Free Car Phone Adaptors

- Filterless Class D Amplifier
- Unique Spread-Spectrum Mode Offers 5dB Emissions Improvement Over Conventional Methods
- Up to 85\% Efficient
- 6W Output Power into $8 \Omega$
- Low 0.07\% THD+N
- High PSRR (76dB at 1kHz)
- 10V to 25V Single-Supply Operation
- Differential Inputs Minimize Common-Mode Noise
- Pin-Selectable Gain Reduces Component Count
- Industry-Leading Integrated Click-and-Pop Suppression
- Low Quiescent Current (18mA)
- Low-Power Shutdown Mode ( $0.2 \mu \mathrm{~A}$ )
- Short-Circuit and Thermal-Overload Protection
- Available in Thermally Efficient, Space-Saving Packages

32-Pin TQFN ( $5 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ )-MAX9713
32-Pin TQFN ( $7 \mathrm{~mm} \times 7 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ )-MAX9714

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Detailed Description

The MAX9713/MAX9714 filterless, Class D audio power amplifiers feature several improvements to switchmode amplifier technology. The MAX9713 is a mono amplifier, the MAX9714 is a stereo amplifier. These devices offer Class AB performance with Class D efficiency, while occupying minimal board space. A unique filterless modulation scheme and spread-spectrum switching mode create a compact, flexible, lownoise, efficient audio power amplifier. The differential input architecture reduces common-mode noise pickup, and can be used without input-coupling capacitors. The devices can also be configured as a single-ended input amplifier.
Comparators monitor the device inputs and compare the complementary input voltages to the triangle waveform. The comparators trip when the input magnitude of the triangle exceeds their corresponding input voltage.

## Operating Modes

Fixed-Frequency Modulation (FFM) Mode The MAX9713/MAX9714 feature three FFM modes with different switching frequencies (Table 1). In FFM mode, the frequency spectrum of the Class D output consists of the fundamental switching frequency and its associated harmonics (see the Wideband Output Spectrum (FFM Mode) graph in the Typical Operating Characteristics). The MAX9713/ MAX9714 allow the switching frequency to be changed by $\pm 35 \%$, should the frequency of one or more of the harmonics fall in a sensitive band. This can be done at any time and not affect audio reproduction.

Figure 1. MAX9714 Outputs with No Input Signal Applied

Table 1. Operating Modes

| FS1 | FS2 | SWITCHING MODE <br> $\mathbf{( k H z )}$ |
| :---: | :---: | :---: |
| L | L | 335 |
| L | H | 460 |
| H | L | 236 |
| H | H | $335 \pm 7 \%$ |

Spread-Spectrum Modulation (SSM) Mode
The MAX9713/MAX9714 feature a unique, patented spread-spectrum mode that flattens the wideband spectral components, improving EMI emissions that may be radiated by the speaker and cables. This mode is enabled by setting FS1 $=$ FS2 $=\mathrm{H}$. In SSM mode, the switching frequency varies randomly by $\pm 1.7 \% \mathrm{kHz}$ around the center frequency ( 335 kHz ). The modulation scheme remains the same, but the period of the triangle waveform changes from cycle to cycle. Instead of a large amount of spectral energy present at multiples of the switching frequency, the energy is now spread over a bandwidth that increases with frequency. Above a few megahertz, the wideband spectrum looks like white noise for EMI purposes (Figure 2).

Efficiency
Efficiency of a Class D amplifier is attributed to the region of operation of the output stage transistors. In a Class D amplifier, the output transistors act as currentsteering switches and consume negligible additional power. Any power loss associated with the Class D output stage is mostly due to the $I^{2} R$ loss of the MOSFET on-resistance, and quiescent current overhead.
The theoretical best efficiency of a linear amplifier is $78 \%$, however that efficiency is only exhibited at peak output powers. Under normal operating levels (typical music reproduction levels), efficiency falls below $30 \%$, whereas the MAX9714 still exhibits $>80 \%$ efficiencies under the same conditions (Figure 3).

## Shutdown

The MAX9713/MAX9714 have a shutdown mode that reduces power consumption and extends battery life. Driving SHDN low places the device in low-power $(0.2 \mu \mathrm{~A})$ shutdown mode. Connect $\overline{\text { SHDN }}$ to a logic high for normal operation.

## Click-and-Pop Suppression

The MAX9713/MAX9714 feature comprehensive click-and-pop suppression that eliminates audible transients on startup and shutdown. While in shutdown, the Hbridge is pulled to GND through $300 \mathrm{k} \Omega$. During startup,

## 6W, Filterless, Spread-Spectrum Mono/Stereo Class D Amplifiers

Figure 2. SSM Radiated Emissions

Figure 3. MAX9714 Efficiency vs. Class AB Efficiency
or power-up, the input amplifiers are muted and an internal loop sets the modulator bias voltages to the correct levels, preventing clicks and pops when the H bridge is subsequently enabled. Following startup, a soft-start function gradually un-mutes the input amplifiers. The value of the soft-start capacitor has an impact on the click/pop levels. For optimum performance, CsS should be at least $0.18 \mu \mathrm{~F}$.

## Mute Function

The MAX9713/MAX9714 feature a clickless/popless mute mode. When the device is muted, the outputs stop switching, muting the speaker. Mute only affects the output state, and does not shut down the device. To mute the MAX9713/MAX9714, drive SS to GND by

Figure 4. MAX9713/MAX9714 Mute Circuit
using a MOSFET pulldown (Figure 4). Driving SS to GND during the power-up/down or shutdown/turn-on cycle optimizes click-and-pop suppression.

## Applications Information Filterless Operation

Traditional Class D amplifiers require an output filter to recover the audio signal from the amplifier's PWM output. The filters add cost, increase the solution size of the amplifier, and can decrease efficiency. The traditional PWM scheme uses large differential output swings ( $2 \times$ VDD peak-to-peak) and causes large ripple currents. Any parasitic resistance in the filter components results in a loss of power, lowering the efficiency.
The MAX9713/MAX9714 do not require an output filter. The devices rely on the inherent inductance of the speaker coil and the natural filtering of both the speaker and the human ear to recover the audio component of the square-wave output. Eliminating the output filter results in a smaller, less costly, more efficient solution.
Because the frequency of the MAX9713/MAX9714 output is well beyond the bandwidth of most speakers, voice coil movement due to the square-wave frequency

[^0]$\square$

Table 2. Gain Settings

| GAIN (dB) | DIFF INPUT <br> (VRMS) | $\mathbf{R L L}_{\mathbf{L}}(\Omega)$ | PouT <br> at 10\% <br> THD+N (W) |
| :---: | :---: | :---: | :---: |
| 13.0 | 1.27 | 16 | 8 |
| 16.1 | 0.89 | 16 | 8 |
| 19.1 | 0.63 | 16 | 8 |
| 22.1 | 0.45 | 16 | 8 |
| 13.0 | 0.78 | 8 | 6 |
| 16.1 | 0.54 | 8 | 6 |
| 19.1 | 0.39 | 8 | 6 |
| 22.1 | 0.27 | 8 | 6 |

is very small. Although this movement is small, a speaker not designed to handle the additional power can be damaged. For optimum results, use a speaker with a series inductance $>30 \mu \mathrm{H}$. Typical $8 \Omega$ speakers exhibit series inductances in the range of $30 \mu \mathrm{H}$ to $100 \mu \mathrm{H}$. Optimum efficiency is achieved with speaker inductances $>60 \mu \mathrm{H}$.

## Gain Selection

Table 2 shows the suggested gain settings to attain a maximum output power from a given peak input voltage and given load.

## Internal Regulator Output (VREG)

The MAX9713/MAX9714 feature an internal, 6V regulator output (VREG). The MAX9713/MAX9714 REG output pin simplifies system design and reduces system cost by providing a logic voltage high for the MAX9713/ MAX9714 logic pins (G_, FS_). VREG is not available as a logic voltage high in shutdown mode. Do not apply VREG as an input voltage high to the MAX9713/ MAX9714 SHDN pin. Do not apply Vreg as a 6V potential to surrounding system components. Bypass REG with a $6.3 \mathrm{~V}, 0.01 \mu \mathrm{~F}$ capacitor to GND.

## Output Offset

Unlike a Class AB amplifier, the output offset voltage of Class $D$ amplifiers does not noticeably increase quiescent current draw when a load is applied. This is due to the power conversion of the Class D amplifier. For example, an 8 mV DC offset across an $8 \Omega$ load results in 1 mA extra current consumption in a Class $A B$ device. In the Class D case, an 8 mV offset into $8 \Omega$ equates to an additional power drain of $8 \mu \mathrm{~W}$. Due to the high efficiency of the Class D amplifier, this represents an additional quiescent current draw of: $8 \mu \mathrm{~W} /\left(V_{D D} / 100 \times \eta\right)$, which is on the order of a few microamps.

Figure 5. Single-Ended Input

## Input Amplifier

Differential Input
The MAX9713/MAX9714 feature a differential input structure, making them compatible with many CODECs, and offering improved noise immunity over a single-ended input amplifier. In devices such as PCs, noisy digital signals can be picked up by the amplifier's input traces. The signals appear at the amplifiers' inputs as commonmode noise. A differential input amplifier amplifies the difference of the two inputs, any signal common to both inputs is canceled.

## Single-Ended Input

The MAX9713/MAX9714 can be configured as singleended input amplifiers by capacitively coupling either input to GND and driving the other input (Figure 5).

## Component Selection

Input Filter
An input capacitor, CIN , in conjunction with the input impedance of the MAX9713/MAX9714, forms a highpass filter that removes the DC bias from an incoming signal. The AC-coupling capacitor allows the amplifier to bias the signal to an optimum DC level. Assuming zero-source impedance, the -3 dB point of the highpass filter is given by:

$$
f_{-3 d B}=\frac{1}{2 \pi R_{\mid N} C_{\mid N}}
$$

Choose CIN so $\mathrm{f}-3 \mathrm{~dB}$ is well below the lowest frequency of interest. Setting $\mathrm{f}-3 \mathrm{~dB}$ too high affects the low-frequency response of the amplifier. Use capacitors whose dielectrics have low-voltage coefficients, such as tantalum or aluminum electrolytic. Capacitors with high-voltage coefficients, such as ceramics, may result in increased distortion at low frequencies.

## Charge-Pump Capacitor Selection

 Use capacitors with an ESR less than $100 \mathrm{~m} \Omega$ for optimum performance. Low-ESR ceramic capacitors minimize the output resistance of the charge pump. For best performance over the extended temperature range, select capacitors with an X7R dielectric.
# 6W, Filterless, Spread-Spectrum Mono/Stereo Class D Amplifiers 

Flying Capacitor (C1)
The value of the flying capacitor (C1) affects the load regulation and output resistance of the charge pump. A C1 value that is too small degrades the device's ability to provide sufficient current drive. Increasing the value of C1 improves load regulation and reduces the chargepump output resistance to an extent. Above $1 \mu \mathrm{~F}$, the onresistance of the switches and the ESR of C1 and C2 dominate.

## Output Capacitor (C2)

The output capacitor value and ESR directly affect the ripple at CHOLD. Increasing C2 reduces output ripple. Likewise, decreasing the ESR of C2 reduces both ripple and output resistance. Lower capacitance values can be used in systems with low maximum output power levels.

## Output Filter

The MAX9713/MAX9714 do not require an output filter. The device passes FCC emissions standards with 36 cm of unshielded speaker cables. However, output filtering can be used if a design is failing radiated emissions due to board layout or cable length, or the circuit is near EMI-sensitive devices. Use a ferrite bead filter when radiated frequencies above 10 MHz are of concern. Use an LC filter when radiated frequencies below 10 MHz are of concern, or when long leads connect the
amplifier to the speaker. Refer to the MAX9714 Evaluation Kit schematic for details of this filter.

## Sharing Input Sources

In certain systems, a single audio source can be shared by multiple devices (speaker and headphone amplifiers). When sharing inputs, it is common to mute the unused device, rather than completely shutting it down, preventing the unused device inputs from distorting the input signal. Mute the MAX9713/MAX9714 by driving SS low through an open-drain output or MOSFET (see the System Diagram). Driving SS low turns off the Class D output stage, but does not affect the input bias levels of the MAX9713/MAX9714. Be aware that during normal operation, the voltage at SS can be up to 7 V , depending on the MAX9713/MAX9714 supply.

Supply Bypassing/Layout Proper power-supply bypassing ensures low distortion operation. For optimum performance, bypass VDD to PGND with a $0.1 \mu \mathrm{~F}$ capacitor as close to each VDD pin as possible. A low-impedance, high-current power-supply connection to VDD is assumed. Additional bulk capacitance should be added as required depending on the application and power-supply characteristics. AGND and PGND should be star connected to system ground. Refer to the MAX9714 Evaluation Kit for layout guidance.

Pin Configurations

MAX9713 TRANSISTOR COUNT: 3093
MAX9714 TRANSISTOR COUNT: 4630
PROCESS: BiCMOS

** NOTE: T4877-1 IS A CUSTOM 48L PKG. WITH 4 LEADS DEPGPULATED. total Number dF leads are 44.
NOTES:

1. DIMENSIONING \& TOLERANCING CONFORM TO ASME Y14.5M-1994.
2. ALL DINENSIONS ARE IN MLLUMETERS, angles are in degrees.
3. N IS THE TOTAL NUMEER OF TERMINLL.
4. THE TERMNAL \#1 IDENTIFER AND TERMINAL NUMBERNG CONVENTION SHALL CONFORM TO JESD 95-1 SPP-012. DETALS OF TERMNAL \#1 IDENTIFER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE NOICATED. THE TERMINAL \#I IDENTFIER MAY BE ETHER A MOL OR MARKED FEATURE.
S. DIMENSION $b$ APPUES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.25 mm AND 0.30 mm FROM TERNINAL ITP.
5. nd and ne refer to the number of terminals on each d and e side respectively.
6. DEPOPULATION IS POSSIBEE IN A SYMMETRICAL FASHION.
7. COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS wEL AS THE TERUINALS.
8. DRAWING CONFORNS TO JEDEC MO22O EXCEPT THE EXPOSED PAD DIMENSIONS OF

T4877-1/-3/-4/-5/-6 \& T5677-1.
10. WARPAGE SHALL NOT EXCEED 0.10 mm .
41) MARKING IS FOR PACKAGE ORIENTATON REFERENCE ONLY
12. NUMBER of LEADS SHOWN ARE FOR REFERENCE ONLY

DRAWNO NOT TO SCNLE

## NOTES

1. Dimensining \& tolerancing conform to asme y14.5M-1994.
2. ALL DIIENSTONS ARE in MILLIMETERS. ANGLES ARE in DEGREES.
3. $N$ IS THE TOTAL NMMBER OF TERMINALS.
4. THE TERMINAL \#1 IDENTIFIER AND TERHINAL NUMBERING CONvENTIIN SHALL

CONFORM TO JESD 95-1 SPP-012. DETALLS OF TERHINAL 11 IDENTIIIER ARE OPTIONAL, BUT MUST BE LICATED VITHIN THE ZZNE INDICATED. THE TERHINAL \#1 IDENTIFIER MAY be EITHER A MILD DR MARKED FEATURE.
S. Dimension bapplies to metallized terminal and is measured betveen 0.25 mm AND 0.30 mm FRDM TERMINAL TIP.
6. ND AND NE REFER TO THE NUMBER OF TERMinals an EACH D AND E SIDE RESPECTIVELY.

8. COPLANARITY APPLIES TI THE EXPOSED HEAT SINK SLUG AS VELL AS THE TERMINALS.
9. DRAVING CONFDRMS TO JEDEC MOQZO, EXCEPT EXPDSED PAD DIMENSIDN FIR

T2855-3, T2855-6, T4055-1 AND T4055-2.
© VARPAGE SHALL NOT EXCEED 0.10 mm .
11. MARKING IS FIR PACKAGE DRIENTATIIN REFERENCE DNLY.
12. NUMBER OF LEADS SHOVN ARE FDR REFERENCE ONLY.
© LEAD CENTERLINES TD BE AT TRUE PDSITION AS DEFINED BY BASIC DIMENSION ' $e^{\prime}$, $\pm 0.05$.
