Incremental Shaft Encoder
OPE1275S Single Channel (Tachometer)
OPE2275S Dual Channel

TT electronics
OPTEK Technology

Features:

- Body O.D. = 28mm [1.10”]
- Shaft Diameter 6.35 mm [0.25”]
- 3/8”-32 UNF Thread
- Pulses per revolution 256 maximum
- Analog Output
- 100 - 5,000 RPM

Description:

The **OPE1275S** and **OPE2275S** are designed for small shaft motors. The **OPE1275S** provides a single channel analog output for speed of rotation while the **OPE2275S** provides a dual channel analog output for speed and direction of rotation.

The output of the **OPE1275S** provides a rise and fall pulse providing the designer two slopes for each pulse doubling the count capability. The **OPE2275S** provides quadrature rise and fall pulse patterns providing the design engineer 4 times the pulse per revolution count.

Power requirements are 5 volts ± .5 volts.

Electrical connection is achieved with a 4-pin Molex 53048-0410 connector providing V+, Ground and Output pins. The mating connector is a 4-pin Molex 51021-0400 (Terminal pin 50058 or 50079) or equivalent.

Frequency response is from DC to 25 kHz providing a maximum of 256 cycles per revolution (CPR) and 1024 quadrature states per revolution (PPR).

This product is designed for general encoding for low-speed applications.

The **OPE1275S and OPE2275S** are fully assembled and ready to be connected to your application.

Applications:

- Printer motors
- Machine automation
- Machine safety

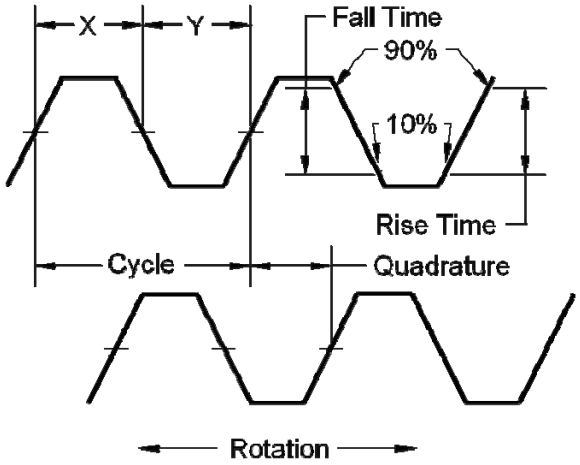
Timing Diagram:



Timing Definitions:

PPR = Pulses Per Revolution
Electrical Degree (°e) = 1/360th of 1 cycle
Cycle = 360 electrical degrees (°e)
Symmetry = Relationship between X & Y in electrical degrees (°e).
Position Error = The difference between the actual shaft position and the position indicated by the encoder cycle count.
Quadrature: The lead or lag difference between channels “A” and “B” in electrical degrees (normally 90°e)
Cycle Error = The difference between the actual shaft rotational position and the cycle count rotational position.
Rise Time = Time required to switch between 10% and 90% of the highest to lowest signal levels.
Fall Time = Time required to switch between 90% and 10% of the highest to lowest signal levels.
