

## **VN410**

# SMART DIRECTION INDICATOR 2 CHANNEL DRIVERS

| TYPE  | V <sub>DSS(cl)</sub> | I <sub>n</sub> (★) | Ron    |
|-------|----------------------|--------------------|--------|
| VN410 | 60V                  | 4.8 A              | 0.07 Ω |

 $I_{n}\left(\star\right)$  : ISO definition nominal current for high side automotive switches.

- LOAD CURRENT UP TO 15A PER CHANNEL
- OVER VOLTAGE PROTECTION
- UNDER VOLTAGE PROTECTION
- DOUBLE FLASHING FREQUENCY IN LOW LOAD CONDITION
- CYCLE BY CYCLE POWER LIMITATION
- BUZZER DRIVER
- TRAILER INDICATION

#### **DESCRIPTION**

The VN410 is a monolithic device made using SGS-THOMSON Vertical Intelligent Power Technology, integrating all the features needed to implement a complete automotive flashing system.

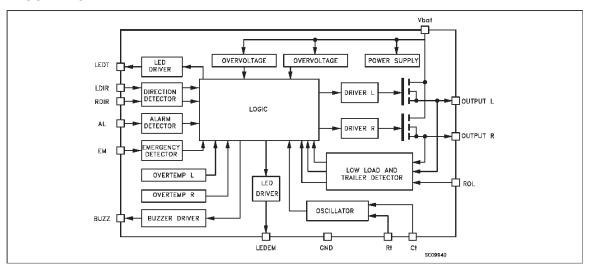

This device has two identical power channels, so the informations are are specified for only one.  $R_t$ ,  $C_t$  pins are connected to an external R, C network which fixes the flashing frequency. LDIR, RDIR direction inputs activate the corresponding output (or none). EM inputs turns on both power outputs for emergency flashing, which is reflected

by flashing red LED connected to LEDEM output. AL input can be connected to an anti-theft alarm system, making both power outputs flashing. In case of low load (burned lamp) buzzer frequency and outputs flashing will double, thus indicating a fault condition (direction mode only).

In case of overloading of the power outputs, built-in-thermal shutdown circuits will reduce duty cycle so as to keep maximum junction temperature within safe limits. Rol pin is connected to an external resistor to detect a burned lamp and a trailer connection. LEDT is connected to an external green LED which indicates the trailer connection.

#### **FUNCTIONAL DESCRIPTION**

#### - NORMAL OPERATION

The right or left channel is activated by the corresponding position of the direction indicator through the direction input pins. Each time an output (or both) is activated, the buzzer is also activated through the BUZZ pin at the double frequency than the output(s). In emergency case, if the emergency button is activated the two channels are turned on. At the same time the emergency red LED is flashing. An anti-theft alarm can be connected to the AL pin, in that condition if the anti-theft alarm is used the two channels are activated.

#### - UNDER-VOLTAGE OR OVER-VOLTAGE CONDITION

In case the device detects an undervoltage or an overvoltage condition the activated channel(s) are automatically switched off whatever the input commands (LDIR, RDIR, AL, EM)

#### - TRAILER OPERATION

The trailer detection is achieved with the ROL external resistor. In that case the green trailer LED is flashing through the pin LEDT in synchronism with the outputs.

#### - LOW LOAD CONDITION

The low load detection is achieved with the ROL external resistor connected between ROL pin and RT pin. If a low load condition has been detected the output flashing frequency on the guilty channel and the buzzer frequency will be double (in direction mode only).

#### - POWER LIMITATION CONDITION

In case of overloading of the power outputs the duty cycle is reduced internally by the device itself so as to keep maximum junction temperature within safe limits.

#### - CHIP GROUND DISCONNECTION

If GND pin is disconnected, the device will switch off provided  $V_{\text{bat}}$  does not exceed 18V.
