High Efficiency Synchronous Step-up DC/DC Converter

FEATURES

High efficiency. (93% when V_{IN}=2.4V, V_{OUT}=3.3V, I_{OUT}=200mA)

Output current up to 500mA. (SS6610 at V_{IN}=2.4V and V_{OUT}=3.3V)

Quiescent supply current of 20μA.

Power-saving shutdown mode (0.1μA typical).

Internal synchronous rectifier (no external diode required).

On-chip low-battery detector.

Low battery hysteresis

Space-saving package: MSOP-8

APPLICATIONS

- Palmtop & Notebook Computers.
- PDAs
- Wireless Phones
- Pocket Organizers.
- Digital Cameras.
- Hand-Held Devices with 1 to 3 Cells of NiMH/NiCd Batteries.

DESCRIPTION

The SS6610/SS6611 are high-efficiency step-up DC/DC converters, with a start-up voltage as low as 0.8V, and an operating voltage down to 0.7V. Consuming only 20μA of quiescent current, these devices include a built-in synchronous rectifier that reduces size and cost by eliminating the need for an external Schottky diode, and improves overall efficiency by minimizing losses.

The switching frequency can range up to 500KHz depending on the load and input voltage. The output voltage can be easily set; by two external resistors or 1.8V to 5.5V; connecting FB to OUT to get 3.3V; or connecting to GND to get 5.0V. The peak current of the internal switch is fixed at 1.0A (SS6610) or 0.65A (SS6611) for design flexibility.

BLOCK DIAGRAM
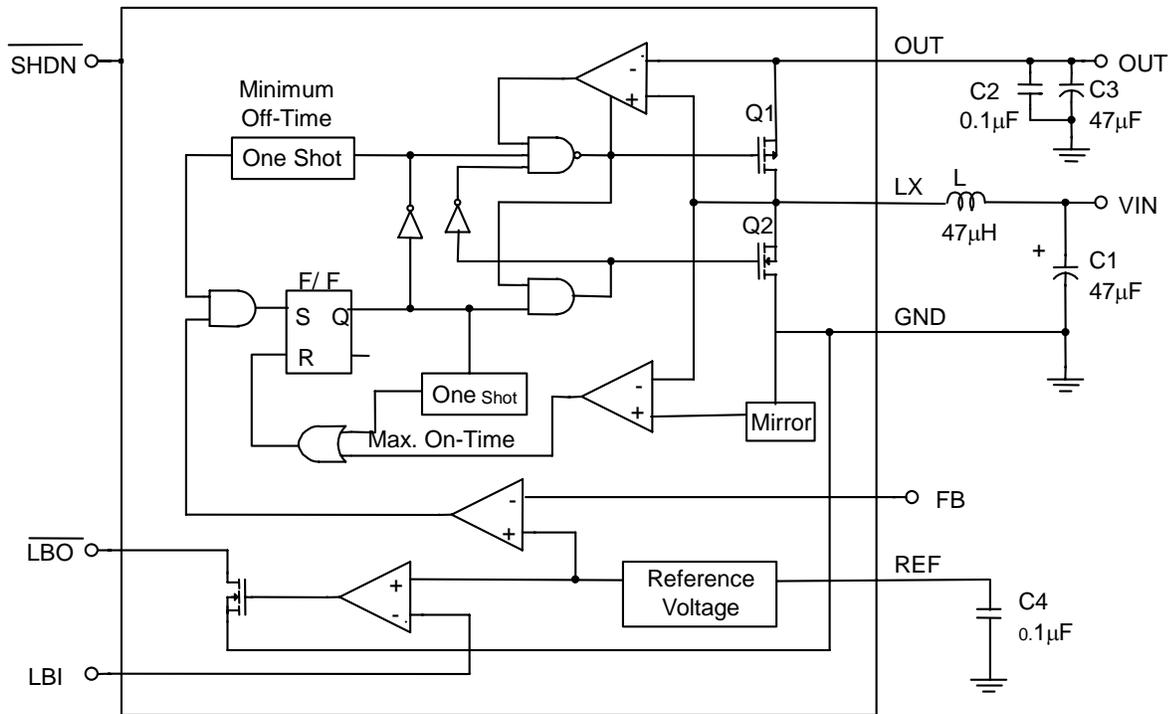

PIN DESCRIPTIONS

PIN 1: FB- Connecting to OUT to get +3.3V output, connecting to GND to get +5.0V output, or using a resistor network to set the output voltage from +1.8V to +5.5V.

PIN 2: LBI- Low-battery comparator input. Internally set at +1.23V to trip.

PIN 3: $\overline{\text{LBO}}$- Open-drain low battery comparator output. Output is low when V_{LBI} is <1.23V. $\overline{\text{LBO}}$ is high impedance during shutdown.

PIN 4: REF- 1.23V reference voltage. Bypass with a 0.1μF capacitor.

PIN 5: $\overline{\text{SHDN}}$- Shutdown input. High=operating, low=shutdown.

PIN 6: GND- Ground

PIN 7: LX- N-channel and P-channel power MOSFET drain.

PIN 8: OUT- Power output. OUT provides boot-strap power to the IC.

APPLICATION INFORMATION

Overview

The SS6610/11 series are high-efficiency, step-up DC/DC converters, featuring a built-in synchronous rectifier, which reduces size and cost by eliminating the need for an external Schottky diode. The start-up voltage of the SS6610 and SS6611 is as low as 0.8V and it operates with an input voltage down to 0.7V. Quiescent supply current is only 20μA.

The internal P-MOSFET on-resistance is typically 0.3Ω to improve overall efficiency by minimizing AC losses. The output voltage can be easily set; by two external resistors for 1.8V to 5.5V; connecting FB to OUT to get 3.3V; or connecting to GND to get 5.0V. The peak current of the internal switch is fixed at 1.0A (SS6610) or 0.65A (SS6611) for design flexibility. The current limits of the SS6610 and SS6611 are 1.0A and 0.65A respectively. The lower current limit allows the use of a physically smaller inductor in space-sensitive applications.

PFM Control Scheme

A key feature of the SS6610 series is a unique minimum-off-time, constant-on-time, current-limited, pulse-frequency-modulation (PFM) control scheme (see BLOCK DIAGRAM) with ultra-low quiescent

current. The peak current of the internal N-MOSFET power switch can be fixed at 1.0A SS6610) or 0.65A (SS6611). The switch frequency depends on either loading conditions or input voltage, and can range up to 500KHz. It is governed by a pair of one-shots that set a minimum off-time (1μs) and a maximum on-time (4μs).

Synchronous Rectification

Using the internal synchronous rectifier eliminates the need for an external Schottky diode, reducing the cost and board space. During the cycle of off-time, the P-MOSFET turns on and shuts the N-MOSFET off. Due to the low turn-on resistance of the MOSFET, the synchronous rectifier signif-cantly improves efficiency without an additional external Schottky diode. Thus, the conversion efficiency can be as high as 93%.

Reference Voltage

The reference voltage (REF) is nominally 1.23V for excellent T.C. performance. In addition, the REF pin can source up to 100μA to external circuit with good load regulation (<10mV). A bypass capacitor of 0.1μF is required for proper operation and good performance.

Shutdown

The whole circuit is shutdown when $V_{\overline{SHDN}}$ is low. In shutdown mode, the current can flow from the battery to the output due to the body diode of the P-MOSFET. V_{OUT} falls to approximately (Vin - 0.6V) and LX remains high impedance. The capacitance and load at OUT determine the rate at which V_{OUT} decays. Shutdown can be pulled as high as 6V. Regardless of the voltage at OUT.

Selecting the Output Voltage

V_{OUT} can be simply set to 3.3V/5.0V by connecting the FB pin to OUT/GND due to the use of an internal resistor divider in the IC (Fig.32 and Fig.33). In order to adjust output voltage, a resistor divider is connected to V_{OUT}, FB, GND (Fig.34). Vout can be calculated by the following equation:

R5=R6 [(V_{OUT} / V_{REF})-1] ....(1)

where V $_{REF}$ =1.23V and V_{OUT} ranges from 1.8V to 5.5V. The recommended R6 is 240kΩ.

Low-Battery Detection

The SS6610 series contains an on-chip comparator with 50mV internal hysteresis (REF, REF+50mV) for low battery detection. If the voltage at LBI falls below the internal reference voltage, LBO (an open-drain output) sinks current to GND.

Component Selection

1. Inductor Selection

An inductor value of 22μH performs well in most applications. The SS6610 series also work with inductors in the 10μH to 47μH range. An inductor with higher peak inductor current creates a higher output voltage ripple ($I_{PEAK}\times$output filter capacitor ESR). The inductor's DC resistance significantly affects efficiency. We can calculate the maximum output current as follows:

$$I_{OUT(MAX)} = \frac{V_{IN}}{V_{OUT}}\left[I_{LIM} - t_{OFF}\left(\frac{V_{OUT} - V_{IN}}{2 \times L}\right)\right]\eta$$

....(2)

where $I_{OUT(MAX)}$=maximum output current in amps

V_{IN}=input voltage

L=inductor value in μH

η =efficiency (typically 0.9)

t_{OFF}=LX switch' off-time in μs

I_{LIM}=1.0A or 0.65A

2. Capacitor Selection

The output ripple voltage is related to the peak inductor current and the output capacitor ESR. Besides output ripple voltage, the output ripple current may also be of concern. A filter capacitor with low ESR is helpful to the efficiency and the steady state output current of the SS6610 series. Therefore a NIPPON MCM Series tantalum capacitor of 100μF/6V is recommended. A smaller capacitor (down to 47μF with higher ESR) is acceptable for light loads or in applications that can tolerate higher output ripple.

3. PCB Layout and Grounding

Since the SS6610/11's switching frequency can range up to 500kHz, the SS6610/11 can be very sensitive. Careful printed circuit layout is important for minimizing ground bounce and noise. The OUT pin should be as clear as possible, and the GND pin should be placed close to the ground plane. Keep the IC's GND pin and the ground leads of the input and output filter capacitors less than 0.2in (5mm) apart. In addition, keep all connection to the FB and LX pins as short as possible. In particular, when using external feedback resistors, locate them as close to the FB as possible. To maximize output power and efficiency, and minimize output ripple voltage, use a ground plane and solder the IC's GND directly to the ground plane. Fig. 35 to 37 are the recommended layout diagrams.

Ripple Voltage Reduction

Two or three parallel output capacitors can significantly improve the output ripple voltage of the SS6610/11. The addition of an extra input capacitor results in a stable output voltage. Fig.38 shows the application circuit with the above features. Fig.39 to Fig.46 show the performance of Fig. 38.
