Programmable High Frequency Crystal Oscillator with Spread Spectrum (SSXO) and No Spread Spectrum (XO) Option

Features

- Crystal Oscillator with Spread Spectrum Clock (SSXO)
- No Spread Spectrum (XO) Option
- Wide operating output clock frequency range of 10 –166 MHz
- Programmable spread spectrum with nominal 31.5 kHz modulation frequency
- Center spread: ±0.25% to ±2.0%
- Down spread: –0.5% to –4.0%
- No spread: ± 0.0%
- Integrated phase-locked loop (PLL)
- 85 ps typical cycle-to-cycle jitter with SSCLK = 133 MHz
- 3.3V operation
- Output enable function
- Package available in 4-Pin ceramic LCC SMD
- Pb-free package
- Industrial temperature from –40°C to 85°C

Benefits

- Provides a wide range of spread percentages for maximum electromagnetic interference (EMI) reduction to meet regulatory agency electromagnetic compliance (EMC) requirements. Reduces development and manufacturing costs and time-to-market.
- This versatile programming feature enables the user to switch between SSXO (with Spread) and XO (without Spread) functions with ease.
- Internal PLL to generate up to 166 MHz output.
- Suitable for most PC, consumer, and networking applications
- Application compatibility in standard and low-power systems
- In house programming of samples and prototype quantities is available using CY3672 programming kit and CY3724 socket adapters. Production quantities are available through Cypress' value added distribution partners or by using third party programmers from BP Microsystems, and HiLo Systems, and others.

Pin Definition

Pin	Name	Description
1	OE	Output Enable pin: Active HIGH. If OE = 1, SSCLK is enabled
2	VSS	Power supply ground
3	SSCLK	Spread spectrum clock output (with or without spread)
4	VDD	3.3V power supply

Functional Description

The CY25701 is a Spread Spectrum Crystal Oscillator (SSXO) IC used to reduce the EMI found in today's high speed digital electronic systems.

The device uses a Cypress proprietary PLL and Spread Spectrum Clock (SSC) technology to synthesize and modulate the frequency of the embedded input crystal. By frequency modulating the clock, the measured EMI at the fundamental and harmonic frequencies are greatly reduced. This reduction in radiated energy can significantly reduce the cost of complying with regulatory agency (EMC) requirements and improve time-to-market without degrading system performance.

The CY25701 uses a programmable configuration memory array to synthesize output frequency and spread%.

The spread percentage is programmed to either center spread or down spread with various spread percentages. The range for center spread is from ±0.25% to ±2.00%. The range for down spread is from –0.5% to –4.0%. Contact the factory for smaller or larger spread percentage amounts if required. Refer to Table 2 for spread selection and no spread values.

The frequency modulated SSCLK output is programmable from 10 to 166 MHz.

The CY25701 is available in a 4-pin ceramic SMD package with an operating temperature range of –40 to 85°C.

Programming Description

Factory and Field Programmable CY25701

Factory and field programming is available for samples and manufacturing by Cypress and its distributors. Submit your request to the local Cypress Field Application Engineer (FAE) or sales representative. Once the request is processed, you will receive a new part number, samples, and data sheet with the programmed values. This part number is used for additional sample request and the production orders. Contact your local Cypress FAE or sales representative for details.

Additional information on the CY25701 is available at the Cypress web site www.cypress.com.

Output Frequency, SSCLK Output (SSCLK, pin 3)

The modulated frequency at the SSCLK output is produced by synthesizing from the embedded crystal oscillator frequency input. The range of synthesized clock is from 10 to 166 MHz.

Spread Percentage (SSCLK, pin 3)

The SSCLK spread is programmable to various spread percentage values from ±0.25% to ±2.0% for center spread and from –0.5% to –4.0% for down spread. Refer to Table 2 for available spread options. Enter ±0.0% (No spread) for XO (crystal oscillator) without spread option.

Frequency Modulation (SSCLK, pin 3)

The default frequency modulation is programmed at 31.5 kHz for all SSCLK frequencies from 10 to 166 MHz. Alternate frequency modulations at 30.1 kHz or 32.9 kHz are selectable using Cyber-ClocksOnline™ software. Contact the factory for other alternate modulation frequencies if required.

Note
2. Guaranteed by characterization, not fully tested.
3. Jitter is configuration dependent. Actual jitter depends upon output frequencies, spread percentage, temperature, and output load. For more information, see the application note, “Jitter in PLL Based Systems: Causes, Effects, and Solutions” available at http://www.cypress.com/clock/appnotes.html or contact your local Cypress Field Application Engineer.

Notes

5. "FLX" suffix is used for products programmed in the field by Cypress distributors.
6. "ZZZ" denotes the assigned product dash number. This number is assigned by the factory after the output frequency and spread percent programming data is received from the customer.
7. Temp can be C (Com'l) or I (Industrial).
