

### FEATURES

**Initial accuracy:**  $\pm 4$  mV maximum  
**Initial accuracy error:**  $\pm 0.2\%$   
**Low TCVO**  
 $\pm 50$  ppm/ $^{\circ}\text{C}$  maximum from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$   
 $30$  ppm/ $^{\circ}\text{C}$  maximum from  $+25^{\circ}\text{C}$  to  $+70^{\circ}\text{C}$   
**Load regulation:**  $400$   $\mu\text{V}/\text{mA}$ ,  $100$  ppm/ $\text{mA}$   
**Line regulation:**  $25$   $\mu\text{V}/\text{V}$ ,  $20$  ppm/ $\text{V}$   
**Wide operating range:**  $V_{\text{IN}} = 2.3$  V to  $15$  V  
**Low power:**  $72$   $\mu\text{A}$  maximum  
**High output sink/source current:**  $\pm 5$  mA minimum  
**Wide temperature range:**  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$   
**Tiny 3-lead SOT-23 package with standard pin configuration**

### APPLICATIONS

**Battery-powered instrumentation**  
**Portable medical instruments**  
**Data acquisition systems**  
**Industrial process control systems**  
**Automotive**

### GENERAL DESCRIPTION

The ADR370<sup>1</sup> is a low cost, 3-terminal (series) band gap voltage reference featuring high accuracy, high stability, and low power consumption packaged in a tiny 3-lead SOT-23 package. Precise matching and thermal tracking of on-chip components, as well as patented temperature drift curvature correction design techniques, have been employed to ensure that the ADR370 provides an accurate 2.048 V output.

### PIN CONFIGURATION

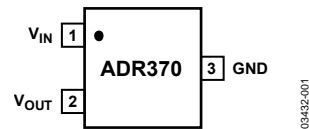

Figure 1. 3-Lead SOT-23

Table 1. ADR370 Products

Products	Output Voltage (V <sub>o</sub> )	Initial Accuracy $\pm$		Temperature Coefficient (ppm/ $^{\circ}\text{C}$ )
		(mV)	(%)	
ADR370BRT-REEL7	2.048	4	0.2	50
ADR370ART-REEL7	2.048	10	0.5	100

This micropowered, low dropout voltage device sources or sinks up to 5 mA of load current while providing a stable 2.048 V output. The compact footprint, high accuracy, and operating range of 2.3 V to 12 V make the ADR370 ideal for use in 3 V and 5 V systems where there can be wide variations in supply voltage and a need to minimize power dissipation.

The ADR370 is offered in A and B grades; all devices are specified over the extended industrial range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

<sup>1</sup> Protected by U.S. Patent No. 5,969,657; other patents pending.

### ELECTRICAL CHARACTERISTICS

$T_A = T_{MIN}$  to  $T_{MAX}$ ,  $V_{IN} = 5\text{ V}$ , unless otherwise noted.

Table 2.

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
OUTPUT VOLTAGE (@ 25°C)	$V_O$		2.044	2.048	2.052	V
INITIAL ACCURACY ERROR	$V_{OERR}$					
A Grade			−10		+10	mV
			−0.5		+0.5	%
B Grade			−4		+4	mV
			−0.2		+0.2	%
OUTPUT VOLTAGE TEMPERATURE DRIFT <sup>1</sup>	$TCV_O$					
A Grade		−40°C to +125°C			100	ppm/°C
B Grade		−40°C to +125°C			50	ppm/°C
		25°C to 70°C			30	ppm/°C
SUPPLY HEADROOM	$V_{IN} - V_{OUT}$		200			mV
LOAD REGULATION		0 mA < $I_{OUT}$ < 5 mA @ 25°C			+0.400	mV/mA
		−3 mA < $I_{OUT}$ < 0 mA @ 25°C			+0.600	mV/mA
		−0.1 mA < $I_{OUT}$ < +0.1 mA			+4.75	mV/mA
LINE REGULATION		$V_{OUT} = 200\text{ mV} < V_{IN} < 15\text{ V}$ $I_{OUT} = 0\text{ mA}$			20	ppm/V
RIPPLE REJECTION	$\Delta V_{OUT}/\Delta V_{IN}$	$V_{IN} = 5\text{ V} \pm 100\text{ mV}$ (f = 120 Hz)	80			dB
QUIESCENT CURRENT					72	μA
SHORT-CIRCUIT CURRENT TO GROUND					15	mA
NOISE VOLTAGE (@ 25°C)		0.1 Hz to 10 Hz		70		μV p-p
		10 Hz to 10 kHz		50		μV rms
TURN-ON SETTLING TIME	$C_L = 0.2\text{ μF}$			100		μs
LONG-TERM STABILITY		1000 hours @ 25°C			100	ppm/1000 hrs
OUTPUT VOLTAGE HYSTERESIS				115		ppm
TEMPERATURE RANGE			−40		+125	°C

<sup>1</sup> Guaranteed by characterization.

## ABSOLUTE MAXIMUM RATINGS

Ratings at 25°C, unless otherwise noted.

Table 3.

Parameter	Rating
Supply Voltage	18 V
Storage Temperature Range	−65°C to +125°C
Operating Temperature Range	−40°C to +125°C
Lead Temperature	
Soldering, 60 sec	215°C
Infrared, 15 sec	220°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 4.

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
3-Lead SOT-23 (RT)	220	102	°C/W

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## TERMINOLOGY

### Temperature Coefficient

Temperature coefficient is the change of output voltage with respect to operating temperature changes, normalized by the output voltage at 25°C. This parameter is expressed in ppm/°C and can be determined with the following equation

$$TCV_o \left[ \frac{\text{ppm}}{^\circ\text{C}} \right] = \frac{V_o(T_2) - V_o(T_1)}{V_o(25^\circ\text{C}) \times (T_2 - T_1)} \times 10^6 \quad (1)$$

where:

$V_o(25^\circ\text{C}) = V_o$  at 25°C.

$V_o(T_1) = V_o$  at Temperature 1.

$V_o(T_2) = V_o$  at Temperature 2.

### Line Regulation

Line regulation is the change in output voltage due to a specified change in input voltage. This parameter accounts for the effects of self-heating. Line regulation is expressed in either percent per volt, parts-per-million per volt, or microvolts per volt change in input voltage.

### Load Regulation

Load regulation is the change in output voltage due to a specified change in load current. This parameter accounts for the effects of self-heating. Load regulation is expressed in either microvolts per milliampere, parts-per-million per milliampere, or ohms of dc output resistance.

### Long-Term Stability

Long-term stability is the typical shift of output voltage at 25°C on a sample of parts subjected to a test of 1000 hours at 25°C.

$$\Delta V_o = V_o(t_1) - V_o(t_2)$$

$$\Delta V_o [\text{ppm}] = \frac{V_o(t_1) - V_o(t_2)}{V_o(t_1)} \times 10^6 \quad (2)$$

where:

$V_o(t_1) = V_o$  at 25°C at Time 0.

$V_o(t_2) = V_o$  at 25°C after 1000 hours operation at 25°C.

### Thermal Hysteresis

Thermal hysteresis is defined as the change of output voltage after the device is cycled through temperature from +25°C to -40°C to +125°C and back to +25°C. This is a typical value from a sample of parts put through such a cycle.

$$V_{o\_HYS} = V_o(25^\circ\text{C}) - V_{o\_TC}$$

$$V_{o\_HYS} [\text{ppm}] = \frac{V_o(25^\circ\text{C}) - V_{o\_TC}}{V_o(25^\circ\text{C})} \times 10^6 \quad (3)$$

where:

$V_o(25^\circ\text{C}) = V_o$  at 25°C.

$V_{o\_TC} = V_o$  at 25°C after temperature cycle of +25°C to -40°C to +125°C and back to +25°C.

## THEORY OF OPERATION

The ADR370 uses the band gap concept to produce a stable, low temperature coefficient voltage reference suitable for high accuracy data acquisition components and systems. This device makes use of underlying temperature characteristics of a silicon transistor's base-emitter voltage ( $V_{BE}$ ) in the forward-biased operating region. Under this condition, all such transistors have a  $-2 \text{ mV}/^\circ\text{C}$  temperature coefficient (TC) and a  $V_{BE}$  that, when extrapolated to absolute zero, 0 K, (with collector current proportional to absolute temperature) approximates the silicon band gap voltage. By summing a voltage that has an equal and opposite temperature coefficient of  $2 \text{ mV}/^\circ\text{C}$  with a  $V_{BE}$  of a forward-biased transistor, an almost zero TC reference can be developed. The simplified circuit diagram in Figure 12 shows how a compensating voltage,  $V_1$ , is achieved by driving two transistors at different current densities and amplifying the resulting  $V_{BE}$  difference ( $\Delta V_{BE}$ , which has a positive TC). The sum ( $V_{BG}$ ) of  $V_{BE}$  and  $V_1$  is then buffered and amplified to produce a stable reference voltage of 2.048 V at the output.

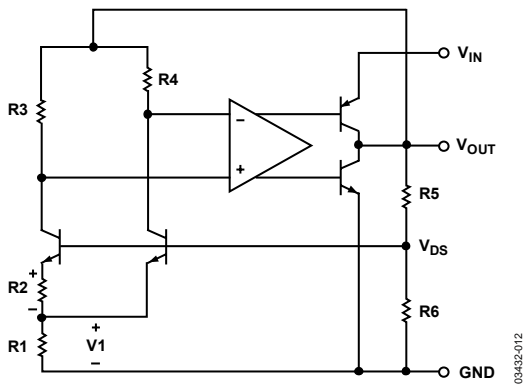

Figure 12. Simplified Schematic

## APPLYING THE ADR370

To achieve the specified performance, two external components should be used in conjunction with the ADR370: a  $4.7 \mu\text{F}$  capacitor and a  $1 \mu\text{F}$  capacitor. The  $4.7 \mu\text{F}$  capacitor should be applied to the input, and the  $1 \mu\text{F}$  capacitor should be applied to the output. Figure 13 shows the ADR370 with both the input and output capacitors attached.

For further transient response optimization, an additional  $0.1 \mu\text{F}$  capacitor in parallel with the  $4.7 \mu\text{F}$  input capacitor can be used.

A  $1 \mu\text{F}$  output capacitor provides stable performance for all loading conditions. The ADR370 can, however, operate under low ( $-100 \mu\text{A} < I_{OUT} < +100 \mu\text{A}$ ) current conditions with just a  $0.2 \mu\text{F}$  output capacitor and a  $1 \mu\text{F}$  input capacitor.

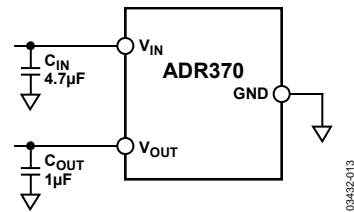

Figure 13. Typical Connection Diagram

## APPLICATIONS INFORMATION

### LOW COST NEGATIVE REFERENCE

A low cost negative reference can be obtained by leveraging the current sinking capability of the ADR370. By simply tying the  $V_{OUT}$  terminal to ground and adding a bias resistor ( $R_{SET}$ ) to the GND pin of the device, a negative voltage reference can be obtained as shown in Figure 14.  $R_{SET}$  should be chosen such that  $I_{SET}$  remains between 1 mA to 5 mA.

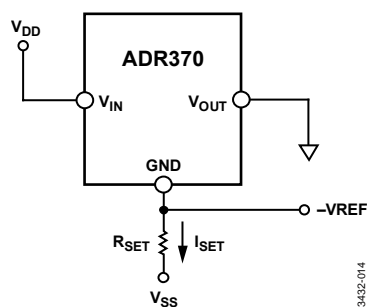

Figure 14. Low Cost Negative Reference

### PRECISION NEGATIVE REFERENCE

Without using any matching resistors, a precision negative reference can be obtained using the configuration shown in Figure 15. The voltage difference between  $V_{OUT}$  and GND of the ADR370 is 2.048 V. Because  $V_{OUT}$  is at virtual ground, U2 closes the loop by forcing the GND pin to be the negative reference node. U2 should be a low offset voltage precision op amp, such as the OP1177.

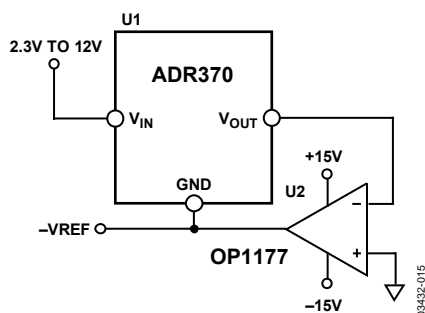

Figure 15. Precision Negative Reference

### LOW COST CURRENT SOURCE

Figure 16 illustrates how a simple, low cost current source can be configured using the ADR370. The load current,  $I_L$ , is simply the sum of  $I_{SET}$  and the quiescent current,  $I_q$ .  $I_{SET}$  is simply the reference voltage generated by the ADR370 divided by  $R_{SET}$ .

$$I_{SET} = \frac{2.048 \text{ V}}{R_{SET}} \quad (4)$$

The quiescent current,  $I_q$ , varies slightly with load. The variation in  $I_q$  limits the use of this circuit to general-purpose applications.

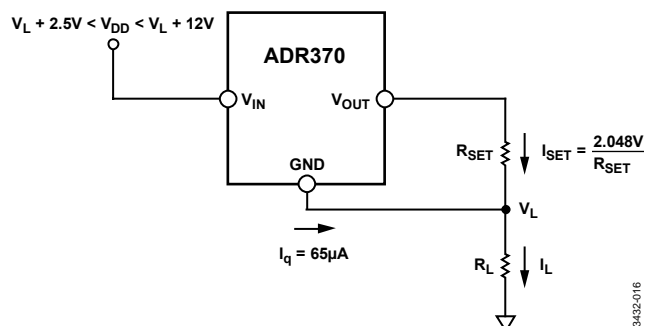

Figure 16. Low Cost Current Source

### PRECISION CURRENT SOURCE WITH ADJUSTABLE OUTPUT

A precision current source can be implemented with the circuit shown in Figure 17. By adding a mechanical or digital potentiometer, this circuit becomes an adjustable current source. If a digital potentiometer, such as the AD5201 is used, the load current is simply the voltage across terminals B-to-W of the digital potentiometer divided by  $R_{SET}$ .

$$I_L = \frac{V_{REF} \times D}{R_{SET} \times 256} \quad (5)$$

where  $D$  is the decimal equivalent of the digital potentiometer input code.

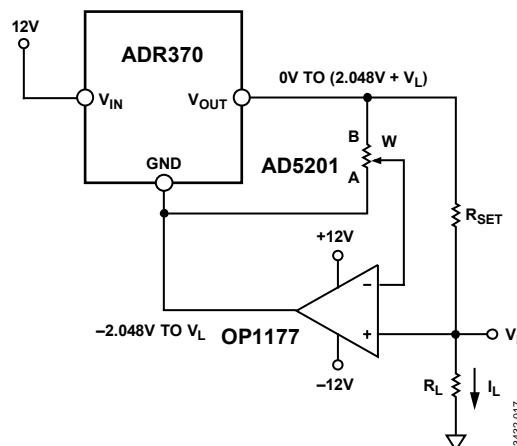

Figure 17. Programmable 0 mA to 5 mA Current Source

To optimize the resolution of this circuit, dual-supply op amps should be used because the ground potential of the ADR370 can swing from  $-2.048 \text{ V}$  at zero scale to  $V_L$  at full scale of the potentiometer setting.
