

ADR5040/ADR5041/ADR5043/ADR5044/ADR5045

FEATURES

- Ultracompact SC70 and SOT-23 packages
- Low temperature coefficient: 75 ppm/°C (maximum)
- Pin compatible with LM4040/LM4050
- Initial accuracy: $\pm 0.1\%$
- No external capacitor required
- Wide operating current range: 50 μA to 15 mA
- Extended temperature range: -40°C to $+125^\circ\text{C}$

APPLICATIONS

- Portable, battery-powered equipment
- Automotives
- Power supplies
- Data acquisition systems
- Instrumentation and process control
- Energy management

GENERAL DESCRIPTION

Designed for space-critical applications, the ADR5040/ADR5041/ADR5043/ADR5044/ADR5045 are high precision shunt voltage references, housed in ultrasmall SC70 and SOT-23 packages. These voltage references are multipurpose, easy-to-use references that can be used in a vast array of applications. They feature low temperature drift, an initial accuracy of better than 0.1%, and fast settling time.

Available in output voltages of 2.048 V, 2.5 V, 3.0 V, 4.096 V, and 5.0 V, the advanced design of the ADR5040/ADR5041/ADR5043/ADR5044/ADR5045 eliminates the need for compensation by an external capacitor, yet the references are stable with any capacitive load. The minimum operating current increases from 50 μA to a maximum of 15 mA. This low operating current and ease of use make these references ideally suited for handheld, battery-powered applications. This family of references has been characterized over the extended temperature range of -40°C to $+125^\circ\text{C}$.

PIN CONFIGURATION

ADR5040/ADR5041/
ADR5043/ADR5044/
ADR5045

- NOTES
1. NC = NO CONNECT.
2. PIN 3 MUST BE LEFT FLOATING OR CONNECTED TO GROUND.

ABSOLUTE MAXIMUM RATINGS

Ratings apply at 25°C, unless otherwise noted.

Table 7.

Parameter	Rating
Reverse Current	25 mA
Forward Current	20 mA
Storage Temperature Range	-65°C to +150°C
Extended Temperature Range	-40°C to +125°C
Junction Temperature Range	-65°C to +150°C
Lead Temperature (Soldering, 60 sec)	300°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 8. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
3-Lead SC70 (KS)	580.5	177.4	°C/W
3-Lead SOT-23 (RT)	270	102	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TYPICAL PERFORMANCE CHARACTERISTICS

$T_A = 25^\circ\text{C}$, $I_{IN} = 100\ \mu\text{A}$, unless otherwise noted.

TERMINOLOGY

Temperature Coefficient

The change in output voltage with respect to operating temperature changes. It is normalized by an output voltage of 25°C. This parameter is expressed in ppm/°C and is determined by the following equation:

$$TCV_{OUT} \left[\frac{\text{ppm}}{^{\circ}\text{C}} \right] = \frac{V_{OUT}(T_2) - V_{OUT}(T_1)}{V_{OUT}(25^{\circ}\text{C}) \times (T_2 - T_1)} \times 10^6 \quad (1)$$

where:

$V_{OUT}(25^{\circ}\text{C}) = V_{OUT}$ at 25°C.

$V_{OUT}(T_1) = V_{OUT}$ at Temperature 1.

$V_{OUT}(T_2) = V_{OUT}$ at Temperature 2.

Thermal Hysteresis

The change in output voltage after the device is cycled through temperatures ranging from +25°C to -40°C, then to +125°C, and back to +25°C. This is common in precision reference and is caused by thermal-mechanical package stress. Changes in environmental storage temperature, board mounting temperature, and the operating temperature are some of the factors that can contribute to thermal hysteresis. The following equation expresses a typical value from a sample of parts put through such a cycle:

$$V_{OUT_HYS} = V_{OUT}(25^{\circ}\text{C}) - V_{OUT_TC}$$

$$V_{OUT_HYS} [\text{ppm}] = \frac{V_{OUT}(25^{\circ}\text{C}) - V_{OUT_TC}}{V_{OUT}(25^{\circ}\text{C})} \times 10^6 \quad (2)$$

where:

$V_{OUT}(25^{\circ}\text{C}) = V_{OUT}$ at 25°C.

$V_{OUT_TC} = V_{OUT}$ at 25°C after a temperature cycle from +25°C to -40°C, then to +125°C, and back to +25°C.

THEORY OF OPERATION

The ADR504x family uses the band gap concept to produce a stable, low temperature coefficient voltage reference suitable for high accuracy data acquisition components and systems. The devices use the physical nature of a silicon transistor base-emitter voltage in the forward-biased operating region. All such transistors have approximately a $-2 \text{ mV}/^\circ\text{C}$ temperature coefficient (TC), making them unsuitable for direct use as a low temperature coefficient reference. Extrapolation of the temperature characteristic of any one of these devices to absolute zero (with the collector current proportional to the absolute temperature), however, reveals that its V_{BE} approaches approximately the silicon band gap voltage. Therefore, if a voltage develops with an opposing temperature coefficient to sum the V_{BE} , a zero temperature coefficient reference results.

APPLICATIONS INFORMATION

The ADR5040/ADR5041/ADR5043/ADR5044/ADR5045 are a series of precision shunt voltage references. They are designed to operate without an external capacitor between the positive and negative terminals. If a bypass capacitor is used to filter the supply, the references remain stable.

For a stable voltage, all shunt voltage references require an external bias resistor (R_{BIAS}) between the supply voltage and the reference (see Figure 19). The R_{BIAS} sets the current that flows through the load (I_L) and the reference (I_{IN}). Because the load and the supply voltage can vary, the R_{BIAS} needs to be chosen based on the following considerations:

- R_{BIAS} must be small enough to supply the minimum I_{IN} current to the ADR5040/ADR5041/ADR5043/ADR5044/ADR5045, even when the supply voltage is at its minimum value and the load current is at its maximum value.
- R_{BIAS} must be large enough so that I_{IN} does not exceed 15 mA when the supply voltage is at its maximum value and the load current is at its minimum value.

Given these conditions, R_{BIAS} is determined by the supply voltage (V_S), the ADR5040/ADR5041/ADR5043/ADR5044/ADR5045 load and operating current (I_L and I_{IN}), and the ADR5040/ADR5041/ADR5043/ADR5044/ADR5045 output voltage (V_{OUT}).

$$R_{BIAS} = \frac{V_S - V_{OUT}}{I_L + I_{IN}} \quad (3)$$

Figure 19. Shunt Reference

Precision Negative Voltage Reference

The ADR5040/ADR5041/ADR5043/ADR5044/ADR5045 are suitable for applications where a precise negative voltage is desired. Figure 20 shows the ADR5045 configured to provide a negative output. Caution should be exercised in using a low temperature sensitive resistor to avoid errors from the resistor.

Figure 20. Negative Precision Reference Configuration

Stacking the ADR504x for User-Definable Outputs

Multiple ADR504x parts can be stacked together to allow the user to obtain a desired higher voltage. Figure 21a shows three ADR5045 devices configured to give 15 V. The bias resistor, R_{BIAS} , is chosen using Equation 3, noting that the same bias current flows through all the shunt references in series. Figure 21b shows three ADR5045 devices stacked together to give -15 V . R_{BIAS} is calculated in the same manner as before. Parts of different voltages can also be added together; that is, an ADR5041 and an ADR5045 can be added together to give an output of $+7.5 \text{ V}$ or -7.5 V , as desired. Note, however, that the initial accuracy error is the sum of the errors of all the stacked parts, as are the temperature coefficient and output voltage change vs. input current.

Figure 21. $\pm 15 \text{ V}$ Output with Stacked ADR5045 Devices

ADR5040/ADR5041/ADR5043/ADR5044/ADR5045

Adjustable Precision Voltage Source

The ADR5040/ADR5041/ADR5043/ADR5044/ADR5045, combined with a precision low input bias op amp such as the AD8610, can be used to output a precise adjustable voltage. Figure 22 illustrates the implementation of this application using the ADR5040/ADR5041/ADR5043/ADR5044/ADR5045. The output of the op amp, V_{OUT} , is determined by the gain of the circuit, which is completely dependent on the resistors, R1 and R2.

$$V_{OUT} = (1 + R2/R1)V_{REF}$$

An additional capacitor, C1, in parallel with R2, can be added to filter out high frequency noise. The value of C1 is dependent on the value of R2.

Figure 22. Adjustable Voltage Source

06526-022

Programmable Current Source

By using just a few ultrasmall and inexpensive parts, it is possible to build a programmable current source, as shown in Figure 23. The constant voltage on the gate of the transistor sets the current through the load. Varying the voltage on the gate changes the current. The AD5247 is a digital potentiometer with I²C[®] digital interface, and the AD8601 is a precision rail-to-rail input op amp. Each incremental step of the digital potentiometer increases or decreases the voltage at the noninverting input of the op amp. Therefore, this voltage varies with respect to the reference voltage.
