(16Mx18)*4(8/16)pcs RIMM® Module based on 288Mb E-die, 32s banks,16K/32ms Ref, 2.5V

Overview

The RIMM® module is a general purpose high- performance memory module suitable for use in a broad range of applications including computer memory, personal computers, workstations and other applications where high bandwidth and low latency are required.

The RIMM module consists of 256/288Mb RDRAM® devices. These are extremely high-speed CMOS DRAMs organized as 16M words by 16 or 18 bits. The use of Rambus Signaling Level (RSL) technology permits up to 1066 MHz transfer rates while using conventional system and board design technologies. RDRAM® devices are capable of sustained data transfers at 0.94 ns per two bytes (7.5ns per 16 bytes).

The RDRAM architecture enables the highest sustained bandwidth for multiple, simultaneous, randomly addressed, memory transactions. The separate control and data buses with independent row and column control yield over 95% bus efficiency. The RDRAM device's 32-bank architecture supports up to four simultaneous transactions per device.

Standard RIMM Module Marking

The RIMM modules available from Samsung are marked like Figure 7 below. This marking also assists users to specify and verify if the correct RIMM modules are installed in their systems. In the diagram, a label is shown attached to

the RIMM module's heat spreader. Information contained on the label is specific to the RIMM module and provides RDRAM device information without requiring removal of the RIMM module's heat spreader.
