

## 300mA SmartOR™ Regulator with $V_{AUX}$ Switch

### Features

- Automatic detection of  $V_{CC}$  input supply
- Glitch-free output during supply transitions
- Built-in hysteresis during supply selection
- 300mA output maximum load current
- Overload current protection
- Short circuit current protection
- Operates from either  $V_{CC}$  or  $V_{OUT}$
- 8-pin SOIC package
- Lead-free version available

### Applications

- PCI adapter cards
- Network Interface Cards (NICs)
- Dual power systems
- Systems with standby capabilities

### Product Description

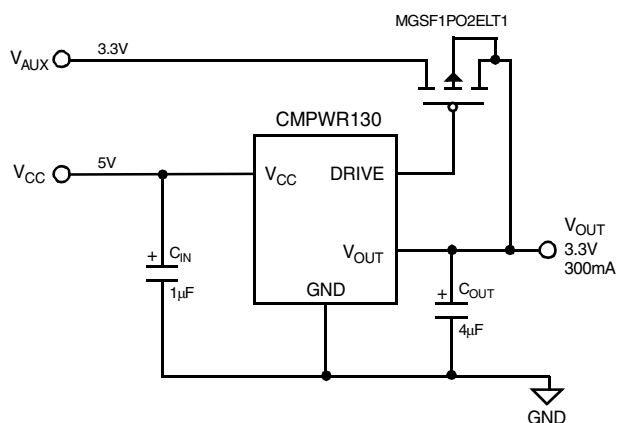

The SmartOR™ CMPWR130 is a low dropout regulator that delivers up to 300mA of load current at a fixed 3.3V output. An internal threshold level (TYP 4.1V) is used to prevent the regulator from being operated below dropout voltage. The device continuously monitors the input supply and will automatically disable the regulator when  $V_{CC}$  falls below the threshold level. When the regulator is disabled, the DRIVE control signal (Active Low) is enabled, which allows an external PMOS switch to power the load from an auxiliary 3.3V supply.

When  $V_{CC}$  is restored to a level above the select threshold, the control signal for the external PMOS switch is disabled and the regulator is once again enabled.

All the necessary control circuitry needed to provide a smooth and automatic transition between the supplies has been incorporated. This allows  $V_{CC}$  to be dynamically switched without loss of output voltage.

The CMPWR130 is housed in a 8-pin SOIC package and is available with optional lead-free finishing.

### Typical Application Circuit

### Simplified Electrical Schematic

**PIN DESCRIPTIONS**

PIN(S)	NAME	DESCRIPTION
1	V <sub>CC</sub>	V <sub>CC</sub> is the power source for the internal regulator and is monitored continuously by an internal controller circuit. Whenever V <sub>CC</sub> exceeds V <sub>CCSEL</sub> (4.30V TYP), the internal regulator (300mA MAX) will be enabled and deliver a fixed 3.3V at V <sub>OUT</sub> . When V <sub>CC</sub> falls below V <sub>CCDES</sub> (4.10V TYP) the regulator will be disabled. Internal loading on this pin is typically 0.6mA when the regulator is enabled, which reduces to 0.2mA whenever the regulator is disabled. If V <sub>CC</sub> falls below the voltage on the V <sub>OUT</sub> pin the V <sub>CC</sub> loading will further reduce to only a few microamperes. During a V <sub>CC</sub> power up sequence, there will be an effective step increase in V <sub>CC</sub> line current when the regulator is enabled. The amplitude of this step increase will depend on the dc load current and any necessary current required for charging/discharging the load capacitance. This line current transient will cause a voltage disturbance at the V <sub>CC</sub> pin. The magnitude of the disturbance will be directly proportional to the effective power supply source impedance being delivered to the V <sub>CC</sub> input.  To prevent chatter during Select and Deselect transitions, a built-in hysteresis voltage of 200mV has been incorporated. It is recommended that the power supply connected to the V <sub>CC</sub> input should have a source resistance of less than 0.25Ω to minimize the event of chatter during the enabling/disabling of the regulator.  An input filter capacitor in close proximity to the V <sub>CC</sub> pin will reduce the effective source impedance and help minimize any disturbances. If the V <sub>CC</sub> pin is within a few inches of the main input filter, a capacitor may not be necessary. Otherwise an input filter capacitor in the range of 1μF to 10μF will ensure adequate filtering.
2 - 3, 5	NC	NC pins are electrically isolated from the internal circuitry. These pins can be connected to any external voltage level without impacting the device functionality.
4	GND	GND is the negative reference for all voltages. The current that flows in the ground connection is very low (typically 550μA) and has minimal variation over all load conditions.
6 - 7	V <sub>OUT</sub>	V <sub>OUT</sub> is the regulator output voltage connection used to power the load. An output capacitor of 4.7μF is used to provide the necessary phase compensation, thereby preventing oscillation. The capacitor also helps to minimize the peak output disturbance during power supply changeover.  When V <sub>CC</sub> falls below V <sub>OUT</sub> , then V <sub>OUT</sub> will be used to provide the necessary quiescent current for the internal reference circuits. This ensures excellent start-up characteristics for the regulator.
8	DRIVE	DRIVE is an active LOW logic output intended to be used as the control signal for driving an external PFET whenever the regulator is disabled. This will allow the voltage at V <sub>OUT</sub> to be powered from an auxiliary supply voltage (3.3V). The DRIVE pin is pulled HIGH to V <sub>CC</sub> whenever the regulator is enabled, this ensures the auxiliary remains isolated during normal regulator operation. The output current sinking ability of this logic signal is equivalent to a 100Ω resistor. The current sourcing ability is equivalent to a 4kΩ resistor.

## Ordering Information

PART NUMBERING INFORMATION					
Pins	Package	Standard Finish		Lead-free Finish	
		Ordering Part Number <sup>1</sup>	Part Marking	Ordering Part Number <sup>1</sup>	Part Marking
8	Power SOIC	CMPWR130S	CMPWR130S	CMPWR130R	CMPWR130R

Note 1: Parts are shipped in Tape & Reel form unless otherwise specified.

## Specifications

ABSOLUTE MAXIMUM RATINGS		
PARAMETER	RATING	UNITS
ESD Protection (HBM)	±2000	V
Pin Input Voltages		
V <sub>CC</sub>	[GND - 0.5] to +6.0	V
V <sub>OUT</sub>	[GND - 0.5] to +6.0	V
DRIVE	[GND - 0.5] to [V <sub>CC</sub> + 0.5]	V
Storage Temperature Range	-40 to +150	°C
Operating Temperature Range		
Ambient	0 to +70	°C
Junction	0 to +125	°C
Power Dissipation (See Note 1)	0.6	W

Note 1: The power rating is based on a printed circuit board heat spreading capability equivalent to 2 square inches of copper connected to the GND pins. Typical multi-layer boards using power plane construction will provide this heat spreading ability without the need for additional dedicated copper area. (Please consult with factory for thermal evaluation assistance).

STANDARD OPERATING CONDITIONS		
PARAMETER	VALUE	UNITS
V <sub>CC</sub>	5.0 ±0.5	V
Ambient Operating Temperature Range	0 to +70	°C
Load Current	0 to 300	mA
C <sub>EXT</sub>	4.7 ±20%	µF

**ELECTRICAL OPERATING CHARACTERISTICS** (SEE NOTE 1)

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
$V_{OUT}$	Regulator Output Voltage	$0mA < I_{LOAD} < 300mA$	3.10	3.300	3.50	V
$V_{CCSEL}$	$V_{CC}$ Select Voltage	Regulator enabled		4.30	4.45	V
$V_{CCDES}$	$V_{CC}$ Deselect Voltage	Regulator disabled	3.90	4.10		V
$V_{CCHYST}$	Hysteresis Voltage	See Note 2		0.20		V
$I_{SC}$	Short Circuit Output Current	$V_{CC} = 5V, V_{OUT} = 0V$	310			mA
$V_{RLOAD}$	Load Regulation	$V_{CC} = 5V, 30mA \leq I_{LOAD} \leq 300mA$		50		mV
$V_{RLINE}$	Line Regulation	$I_{LOAD} = 5mA; 4.5V \leq V_{CC} \leq 5.5V$		50		mV
$I_{RCC}$	$V_{CC}$ Pin Reverse Leakage	$V_{OUT} = 3.3V, V_{CC} = 0V$		2	50	$\mu A$
$I_{CC}$	Quiescent Supply Current	$V_{CC} > V_{CCSEL}, I_{LOAD} = 0mA$ $V_{CCDES} > V_{CC} > V_{OUT}$ $V_{OUT} > V_{CC}$		0.60 0.20 0.01	0.80	mA mA mA
$I_{GND}$	Ground Current (see Note 3)	$V_{CCSEL} > V_{CC}$ (Regulator disabled) $V_{CC} = 5V, I_{LOAD} = 5mA$ $V_{CC} = 5V, I_{LOAD} = 300mA$		0.20 0.60 0.70	0.40	mA mA mA
$R_{OH}$	DRIVE Pull-up Resistance	$R_{PULLUP}$ to $V_{CC}$ , $V_{CC} > V_{CCSEL}$		4.0	8.0	$k\Omega$
$R_{OL}$	DRIVE Pull-down Resistance	$R_{PULLDOWN}$ to GND, $V_{CCDES} > V_{CC}$		0.1	0.4	$k\Omega$

Note 1: Operating Characteristics are over Standard Operating Conditions unless otherwise specified.

Note 2: The hysteresis defines the maximum level of acceptable disturbance on  $V_{CC}$  during switching. It is recommended that the  $V_{CC}$  source impedance be kept below  $0.25\Omega$  to ensure the switching disturbance remains below the hysteresis during select/deselect transitions. An input capacitor may be required to help minimize the switching transient.

Note 3: Ground pin current consists of controller current (0.15mA) and regulator current if enabled. The controller always draws 0.15mA from either  $V_{CC}$  or  $V_{OUT}$ , whichever is greater. All regulator current is supplied exclusively from  $V_{CC}$ . At high load currents a small increase occurs due to current limit protection circuitry.

**Performance Information (cont'd)**

**CMPWR130 Typical Thermal Characteristics**

The overall junction to ambient thermal resistance ( $\theta_{JA}$ ) for device power dissipation ( $P_D$ ) consists primarily of two paths in series. The first path is the junction to the case ( $\theta_{JC}$ ) which is defined by the package style, and the second path is case to ambient ( $\theta_{CA}$ ) thermal resistance which is dependent on board layout. The final operating junction temperature for any set of conditions can be estimated by the following thermal equation:

$$T_{JUNC} = T_{AMB} + P_D (\theta_{JC}) + P_D (\theta_{CA})$$

$$= T_{AMB} + P_D (\theta_{JA})$$

The CMPWR130 uses a standard SOIC package. When this package is mounted on a double-sided printed circuit board with two square inches of copper allocated for "heat spreading", the resulting  $\theta_{JA}$  is 85°C/W.

Based on a maximum power dissipation of 0.51W (1.7V x 300mA) with an ambient of 70°C, the resulting junction temperature will be:

$$T_{JUNC} = T_{AMB} + P_D (\theta_{JA})$$

$$= 70^\circ\text{C} + 0.51\text{W} (85^\circ\text{C/W})$$

$$= 70^\circ\text{C} + 43^\circ\text{C} = 113^\circ\text{C}$$

Thermal characteristics were measured using a double-sided board with two square inches of copper area connected to the GND pin for "heat spreading".

Measurements showing performance up to junction temperature of 125°C were performed under light load conditions (5mA). This allows the ambient temperature to be representative of the internal junction temperature.

Note: The use of multi-layer board construction with separate ground and power planes will further enhance the overall thermal performance. In the event of no copper area being dedicated for heat spreading, a multi-layer board construction, using only the minimum size pad layout, will provide the CMPWR130 with an overall  $\theta_{JA}$  of 100°C/W which allows up to 550mW to be safely dissipated.
