

FAN4272

Dual, Low Cost, +2.7V & +5V, Rail-to-Rail I/O Amplifier

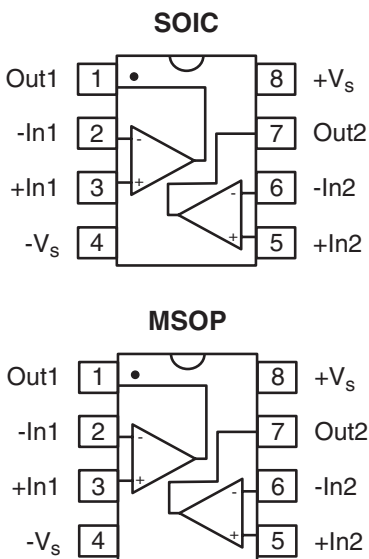

Features at 2.7V

- 130µA supply current per amplifier
- 4MHz bandwidth
- Output swings to within 25mV of either rail
- Input voltage range exceeds the rail by >250mV
- 4V/µs slew rate
- 16mA output current
- 22nV/√Hz input voltage noise
- Operating temperature range: -40°C to +125°C
- Directly replaces TLC2272 in single supply applications
- Available in SOIC-8 and MSOP-8 package options
- Available evaluation boards:
KEB006 (SOIC) and KEB010 (MSOP)

Applications

- Automotive applications
- Portable/battery-powered applications
- PCMCIA, USB
- Mobile communications, cellular phones, pagers
- Notebooks and PDA's
- Sensor Interface
- A/D buffer
- Active filters
- Signal conditioning
- Portable test instruments

FAN4272 Packages

Description

The FAN4272 is an ultra-low cost, low power, voltage feedback amplifier. At 5V, the FAN4272 uses only 160µA of supply current per amplifier and is designed to operate from a supply range of 2.5V to 5.5V (±1.25V to 2.75V). The input voltage range exceeds the negative and positive rails.

The FAN4272 offers high bipolar performance at a low CMOS price. The FAN4272 offers superior dynamic performance with a 4MHz small signal bandwidth and 4V/µs slew rate. The combination of low power, high bandwidth, and rail-to-rail performance make the FAN4272 well suited for battery-powered communication/computing systems.

Large Signal Freq. Response $V_s = +5V$

Output Swing vs. Load $V_s = +5V$

Absolute Maximum Ratings

Parameter	Min.	Max.	Unit
Supply Voltages	0	+6	V
Maximum Junction Temperature	–	+175	°C
Storage Temperature Range	-65	+150	°C
Lead Temperature, 10 seconds	–	+260	°C
Operating Temperature Range, recommended	-40	+125	°C
Input Voltage Range	$-V_S - 0.5$	$+V_S + 0.5$	V

Electrical Specifications

($V_S = +2.7V$, $G = 2$, $R_L = 10k\Omega$ to $V_S/2$, $R_f = 5k\Omega$, $T_a = 25^\circ C$; unless otherwise noted)

Parameter	Conditions	Min.	Typ.	Max.	Unit
AC Performance					
-3dB Bandwidth ¹	$G = +1$, $V_O = 0.02V_{pp}$		4		MHz
	$G = +2$, $V_O = 0.2V_{pp}$		3.7		MHz
Large Signal Bandwidth	$G = +2$, $V_O = 2V_{pp}$		1.1		MHz
Gain Bandwidth Product			1.7		MHz
Rise and Fall Time	1V step		215		ns
Overshoot	1V step		<1		%
Slew Rate	1V step		4		V/ μs
2nd Harmonic Distortion	1V _{pp} , 10kHz		-74		dBc
3rd Harmonic Distortion	1V _{pp} , 10kHz		-62		dBc
THD	1V _{pp} , 10kHz		0.08		%
Input Voltage Noise	>10kHz		22		nV/ \sqrt{Hz}
Crosstalk	>100kHz		95		dB
DC Performance					
Input Offset Voltage			<0.5		mV
Average Drift			4		$\mu V/^\circ C$
Input Bias Current			90		nA
Average Drift			100		$pA/^\circ C$
Power Supply Rejection Ratio ²	DC	70	85		dB
Open Loop Gain	$R_L = 10k\Omega$		75		dB
Quiescent Current Per Channel			130		μA
Input Characteristics					
Input Resistance			12		M Ω
Input Capacitance			1.8		pF
Input Common Mode Voltage Range			-0.25 to 2.95		V
Common Mode Rejection Ratio	DC, $V_{cm} = 0V$ to V_S		78		dB
Output Characteristics					
Output Voltage Swing	$R_L = 10k\Omega$ to $V_S/2^2$	0.06 to 2.64	0.025 to 2.68		V
	$R_L = 1k\Omega$ to $V_S/2$		0.07 to 2.645		V
	$R_L = 200\Omega$ to $V_S/2$		0.198 to 2.59		V
Output Current			± 16		mA
Power Supply Operating Range		2.5	2.7	5.5	V

Min/max ratings are based on product characterization and simulation. Individual parameters are tested as noted. Outgoing quality levels are determined from tested parameters.

Notes:

- For $G = +1$, $R_f = 0$.
- Guaranteed by testing or statistical analysis at $25^\circ C$.

Application Information

General Description

The FAN4272 is single supply, general purpose, voltage-feedback amplifier. The FAN4272 is fabricated on a complementary bipolar process, features a rail-to-rail input and output, and is unity gain stable.

The typical non-inverting circuit schematic is shown in Figure 1.

Figure 1: Typical Non-inverting Configuration

Input Common Mode Voltage

The common mode input range extends to 250mV below ground and to 250mV above V_s , in single supply operation. Exceeding these values will not cause phase reversal. However, if the input voltage exceeds the rails by more than 0.5V, the input ESD devices will begin to conduct. The output will stay at the rail during this overdrive condition. If the absolute maximum input voltage (700mV beyond either rail) is exceeded, externally limit the input current to $\pm 5\text{mA}$ as shown in Figure 2.

Figure 2: Circuit for Input Current Protection

Power Dissipation

The maximum internal power dissipation allowed is directly related to the maximum junction temperature. If the maximum junction temperature exceeds 150°C, some performance

degradation will occur. If the maximum junction temperature exceeds 175°C for an extended time, device failure may occur.

Overdrive Recovery

Overdrive of an amplifier occurs when the output and/or input ranges are exceeded. The recovery time varies based on whether the input or output is overdriven and by how much the ranges are exceeded. The FAN4272 will typically recover in less than 50ns from an overdrive condition. Figure 3 shows the FAN4272 in an overdriven condition.

Figure 3: Overdrive Recovery

Driving Capacitive Loads

The *Frequency Response vs. C_L* plot, illustrates the response of the FAN4272. A small series resistance (R_s) at the output of the amplifier, illustrated in Figure 4, will improve stability and settling performance. R_s values in the *Frequency Response vs. C_L* plot were chosen to achieve maximum bandwidth with less than 2dB of peaking. For maximum flatness, use a larger R_s . Capacitive loads larger than 200pF require the use of R_s .

Figure 4: Typical Topology for driving a capacitive load

Driving a capacitive load introduces phase-lag into the output signal, which reduces phase margin in the amplifier. The unity gain follower is the most sensitive configuration. In a unity gain follower configuration, the FAN4272 requires a 75Ω series resistor to drive a 100pF load.

Layout Considerations

General layout and supply bypassing play major roles in high frequency performance. Fairchild has evaluation boards to use as a guide for high frequency layout and as aid in device testing and characterization. Follow the steps below as a basis for high frequency layout:

- Include 6.8μF and 0.01μF ceramic capacitors
- Place the 6.8μF capacitor within 0.75 inches of the power pin
- Place the 0.01μF capacitor within 0.1 inches of the power pin
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance
- Minimize all trace lengths to reduce series inductances

Refer to the evaluation board layouts shown in Figure 6 for more information.

Evaluation Board Information

The following evaluation boards are available to aid in the testing and layout of this device:

Eval Bd	Description	Products
KEB006	Dual Channel, Dual Supply, 8 lead SOIC	FAN4272AM8
KEB010	Dual Channel, Dual Supply, 8 lead MSOP	FAN4272AMU8

Evaluation board schematics and layouts are shown in Figure 5 and Figure 6.
