Features

- ☐ Operating voltage up to 300V
- ☐ 5V to 15V logic input capability
- ☐ Output swings below GND if required
- ☐ Drives high-voltage P-Channel MOS from logic level signal
- ☐ Surface mount packaging available
- ☐ No "floating logic" required
- ☐ 8 independent channels

Applications

- ☐ ATE systems
- ☐ Printers/plotters
- ☐ P-Channel MOSFET control

Absolute Maximum Ratings[1,2]

Supply voltage, V_{DD}		V_{NN} - 0.3V to +16V
Supply Voltage, V_{PP}		V_{NN} - 0.3V to + 300V
Supply Voltage, V_{NN}		-16V to 0.3V
Logic inputs levels	V_{IN}	V_{NN} - 0.3V to V_{DD} + 0.3V
	V_{OUTPUT}	V_{PP} + 0.3V max
I_{OUT} — DC per Channel		30mA
Continuous total power dissipation[2]		700mW
Operating temperature range		0°C to 70°C
Storage temperature range		-65°C to + 150°C

Note 1: All voltages are referenced to chip ground.

Note 2: For operation above 25°C ambient derate lineraly to 85°C at 8mW/°C.

General Description

The Supertex HT01 8-channel Level Translator is designed to implement the necessary level translation between logic level signals and voltage swings required to drive high-voltage P-Channel MOSFET transistors. This device is intended to provide gate drive signals to devices such as the Supertex AP01 P-Channel MOSFET Array in applications requiring active pull-up to a high-voltage (V_{PP}) line of up to 300 volts. Logic input can be from 5 volts to 15 volts and is referenced to the logic supply (V_{DD}).

When an input is switched to 4.2 volts below the V_{DD} supply, the corresponding output will typically switch from V_{PP} to V_{PP} -14 volts. If the V_{PP} supply remains above 12 volts, the negative supply (V_{NN}) would be connected to system ground (GND). If variations of the V_{PP} supply level require the P-Channel MOSFET gate drive to swing below GND in order to turn on, connect the V_{NN} pin to a negative supply of up to -15 volts. The logic inputs can remain between V_{DD} and system ground (GND) and still provide correct operation.

In an OFF condition, the HT01 is a low power device. In an ON condition, each channel will dissipate power determined by the V_{PP} and V_{NN}voltage. Internal power dissipation must be considered when the application requires that more than one channel be active at one time, especially at higher V_{PP} voltage values.
