+3.3V, 1Mbps, Low-Supply-Current CAN Transceiver

MAX3051

General Description

The MAX3051 interfaces between the CAN protocol controller and the physical wires of the bus lines in a controller area network (CAN). The MAX3051 provides differential transmit capability to the bus and differential receive capability to the CAN controller. The MAX3051 is primarily intended for +3.3V single-supply applications that do not require the stringent fault protection specified by the automotive industry (ISO 11898).

The MAX3051 features four different modes of operation: high-speed, slope-control, standby, and shutdown mode. High-speed mode allows data rates up to 1Mbps. The slope-control mode can be used to program the slew rate of the transmitter for data rates of up to 500kbps. This reduces the effects of EMI, thus allowing the use of unshielded twisted or parallel cable. In standby mode, the transmitter is shut off and the receiver is pulled high, placing the MAX3051 in low-current mode. In shutdown mode, the transmitter and receiver are switched off.

The MAX3051 input common-mode range is from -7V to +12V, exceeding the ISO 11898 specification of -2V to +7V. These features, and the programmable slew-rate limiting, make the part ideal for nonautomotive, harsh environments. The MAX3051 is available in 8-pin SO and SOT23 packages and operates over the -40°C to +85°C extended temperature range.

Features

♦ **Low +3.3V Single-Supply Operation**

♦ **Wide -7V to +12V Common-Mode Range**

♦ **Small SOT23 Package**

♦ **Four Operating Modes**
   High-Speed Operation Up to 1Mbps
   Slope-Control Mode to Reduce EMI (Up to 500kbps)
   Standby Mode
   Low-Current Shutdown Mode

♦ **Thermal Shutdown**

♦ **Current Limiting**

_____Detailed Description

| PIN	NAME	FUNCTION
1	TXD	Transmit Data Input. TXD is a CMOS/TTL-compatible input from a CAN controller. TXD has an internal 75kΩ pullup resistor.
2	GND	Ground
3	V_CC	Supply Voltage. Bypass V_CC to GND with a 0.1µF capacitor.
4	RXD	Receive Data Output. RXD is a CMOS/TTL-compatible output.
5	SHDN	Shutdown Input, CMOS/TTL-Compatible. Drive SHDN high to put the MAX3051 in shutdown. SHDN has an internal 75kΩ pulldown resistor to GND.
6	CANL	CAN Bus Line Low
7	CANH	CAN Bus Line High
8	RS	Mode-Select Input. Drive RS low or connect to GND for high-speed operation. Connect a resistor between RS and GND to control output slope. Drive RS high to put into standby mode (see the _Mode Selection_ section).
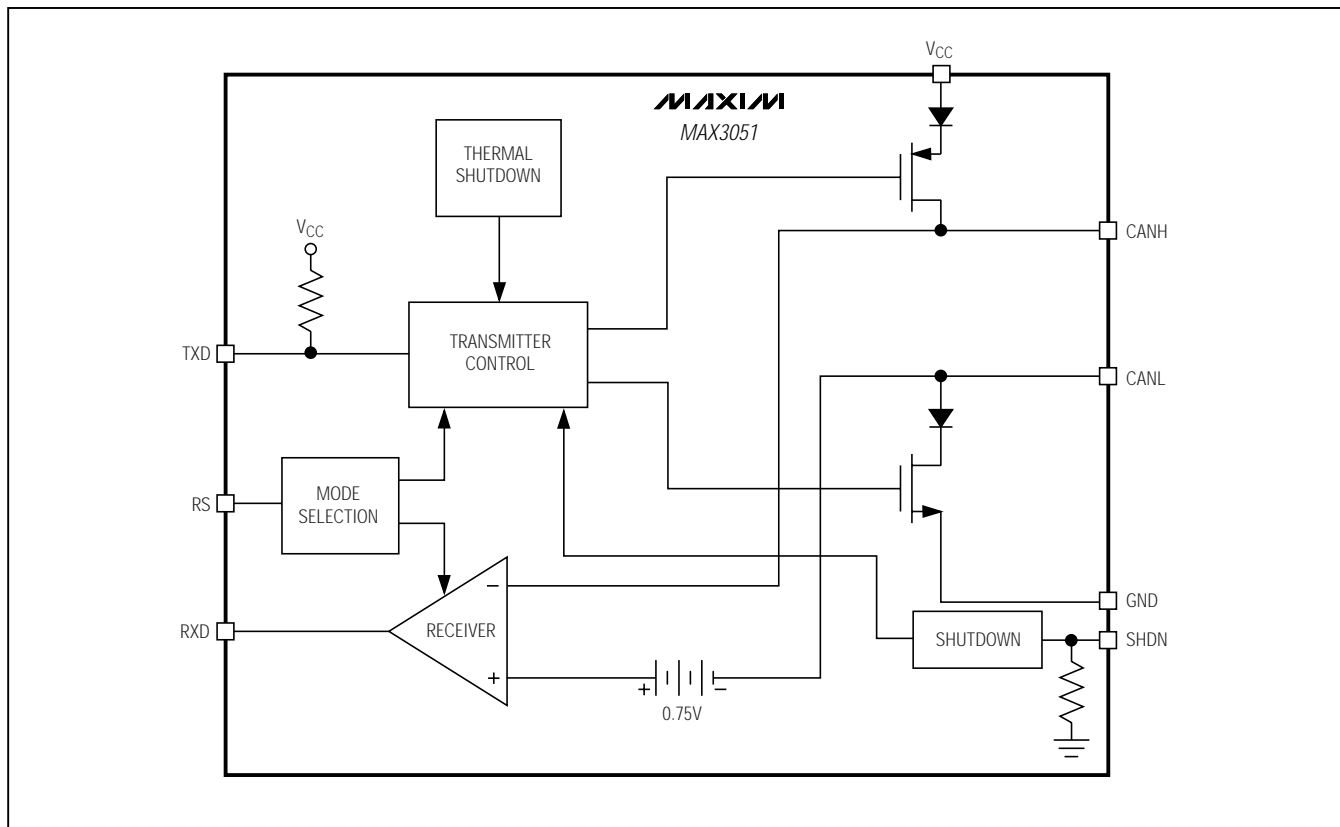

Figure 5. MAX3051 Functional Diagram

_____Detailed Description

The MAX3051 interfaces between the CAN protocol controller and the physical wires of the bus lines in a CAN. It provides differential transmit capability to the bus and differential receive capability to the CAN controller. It is primarily intended for +3.3V single-supply applications that do not require the stringent fault protection specified by the automotive industry (ISO 11898)

The MAX3051 features four different modes of operation: high-speed, slope-control, standby, and shutdown mode. High-speed mode allows data rates up to 1Mbps. The slope-control mode can be used to program the slew rate of the transmitter for data rates of up to 500kbps. This reduces the effects of EMI, thus allowing the use of unshielded twisted or parallel cable. In standby mode, the transmitter is shut off and the receiver is pulled high, placing the MAX3051 in low-current mode. In shutdown mode, the transmitter and receiver are switched off.

The MAX3051 input common-mode range is from -7V to +12V, exceeding the ISO 11898 specification of -2V to +7V. These features, and the programmable slew-rate limiting, make the part ideal for nonautomotive, harsh environments.

The transceivers operate from a single +3.3V supply and draw 35µA of supply current in dominant state and 2µA in recessive state. In standby mode, supply current is reduced to 8µA. In shutdown mode, supply current is less than 1µA.

CANH and CANL are output short-circuit current limited and are protected against excessive power dissipation by thermal-shutdown circuitry that places the driver outputs into a high-impedance state.

Transmitter

The transmitter converts a single-ended input (TXD) from the CAN controller to differential outputs for the bus lines (CANH, CANL). The truth table for the transmitter and receiver is given in Table 1.

Receiver

The receiver reads differential inputs from the bus lines (CANH, CANL) and transfers this data as a single-ended output (RXD) to the CAN controller. It consists of a comparator that senses the difference V_{DIFF} = (CANH - CANL) with respect to an internal threshold of +0.75V. If this V_{DIFF} is greater than 0.75, a logic-low is present at RXD. If V_{DIFF} is less than 0.75V, a logic-high is present. The receiver always echoes the CAN BUS data.

The CANH and CANL common-mode range is -7V to +12V. RXD is logic-high when CANH and CANL are shorted or terminated and undriven.

Mode Selection

High-Speed Mode

Connect RS to ground to set the MAX3051 to high-speed mode. When operating in high-speed mode, the MAX3051 can achieve transmission rates of up to 1Mbps. In high-speed mode, use shielded twisted pair cable to avoid EMI problems.

Slope-Control Mode

Connect a resistor from RS to ground to select slope-control mode (Table 2). In slope-control mode, CANH and CANL slew rates are controlled by the resistor connected to the RS pin. Maximum transmission speeds are controlled by R_{RS} and range from 40kbps to 500kbps. Controlling the rise and fall slopes reduces EMI and allows the use of an unshielded twisted pair or a parallel pair of wires as bus lines. The equation for selecting the resistor value is given by:

$$R_{RS} \text{ (k}\Omega) \approx 12000 \text{ / (maximum speed in kbps)}$$

See the Slew Rate vs. RRS graph in the *Typical Operating Characteristics.*

Standby Mode

If a logic-high is applied to RS, the MAX3051 enters a low-current standby mode. In this mode, the transmitter

Table 1. Transmitter and Receiver Truth Table When Not Connected to The Bus

TXD	RS	SHDN	CANH	CANL	BUS STATE	RXD
Low	V_{RS} < 0.75 x V_{CC}	Low	High	Low	Dominant	Low
High or float	V_{RS} < 0.75 x V_{CC}	Low	5kΩ to 25kΩ to V_{CC}/2	5kΩ to 25kΩ to V_{CC}/2	Recessive	High
X	V_{RS} > 0.75 x V_{CC}	Low	5kΩ to 25kΩ to GND	5kΩ to 25kΩ to GND	Recessive	High
X	X	High	Floating	Floating	Floating	High

MAX3051

is switched off and the receiver is switched to a low-current/low-speed state. If dominant bits are detected, RXD switches to low level. The microcontroller should react to this condition by switching the transceiver back to normal operation.

When the MAX3051 enters standby mode, RXD goes high for 4µs (max) regardless of the BUS state. However, after 4µs, RXD goes low only when the BUS is dominant, otherwise RXD remains high (when the BUS is recessive). For proper measurement of standby-to-receiver active time (t_{SBRXDL}), the BUS should be in dominant state (see Figure 2).

Shutdown

Drive SHDN high to enter shutdown mode. Connect SHDN to ground or leave floating for normal operation.

Thermal Shutdown

If the junction temperature exceeds +160°C, the device is switched off. The hysteresis is approximately 25°C, disabling thermal shutdown once the temperature drops below 135°C. In thermal shutdown, CANH and CANL go recessive and all IC functions are disabled.

_____Applications Information

Reduced EMI and Reflections

In slope-control mode, the CANH and CANL outputs are slew-rate limited, minimizing EMI and reducing reflections caused by improperly terminated cables.

In multidrop CAN applications, it is important to maintain a direct point-to-point wiring scheme. A single pair of wires should connect each element of the CAN bus, and the two ends of the bus should be terminated with 120Ω resistors (Figure 6). A star configuration should never be used.

Any deviation from the point-to-point wiring scheme creates a stub. The high-speed edge of the CAN data on a stub can create reflections back down the bus. These reflections can cause data errors by eroding the noise margin of the system.

Although stubs are unavoidable in a multidrop system, care should be taken to keep these stubs as small as possible, especially in high-speed mode. In slope-control mode, the requirements are not as rigorous, but stub length should still be minimized.

Power Supply and Bypassing

The MAX3051 requires no special layout considerations beyond common practices. Bypass V_{CC} to GND with a 0.1µF ceramic capacitor mounted close to the IC with short lead lengths and wide trace widths.

Table 2. Mode Selection Truth Table

| CONDITION FORCED AT PIN RS	MODE	RESULTING CURRENT AT RS
$V_{RS} < 0.3 \times V_{CC}$	High Speed	$|I_{RS}| < 500µA$
$0.4 \times V_{CC} < V_{RS} < 0.6 \times V_{CC}$	Slope Control	$10µA < |I_{RS}| < 200µA$
$V_{RS} > 0.75 \times V_{CC}$	Standby	$|I_{RS}| < 10µA$
