

±15kV ESD-Protected, ±60V Fault-Protected, 10Mbps, Fail-Safe RS-485/J1708 Transceivers

General Description

The MAX3440E–MAX3444E fault-protected RS-485 and J1708 transceivers feature ±60V protection from signal faults on communication bus lines. Each device contains one differential line driver with three-state output and one differential line receiver with three-state input. The 1/4-unit-load receiver input impedance allows up to 128 transceivers on a single bus. The devices operate from a 5V supply at data rates of up to 10Mbps. True fail-safe inputs guarantee a logic-high receiver output when the receiver inputs are open, shorted, or connected to an idle data line.

Hot-swap circuitry eliminates false transitions on the data bus during circuit initialization or connection to a live backplane. Short-circuit current-limiting and thermal shutdown circuitry protect the driver against excessive power dissipation, and on-chip ±15kV ESD protection eliminates costly external protection devices.

The MAX3440E–MAX3444E are available in 8-pin SO and PDIP packages and are specified over industrial and automotive temperature ranges.

Applications

RS-422/RS-485 Communications
Truck and Trailer Applications
Industrial Networks
Telecommunications Systems
Automotive Applications
HVAC Controls

Features

- ◆ ±15kV ESD Protection
- ◆ ±60V Fault Protection
- ◆ Guaranteed 10Mbps Data Rate (MAX3441E/MAX3443E)
- ◆ Hot Swappable for Telecom Applications
- ◆ True Fail-Safe Receiver Inputs
- ◆ Enhanced Slew-Rate-Limiting Facilitates Error-Free Data Transmission (MAX3440E/MAX3442E/MAX3444E)
- ◆ Allow Up to 128 Transceivers on the Bus
- ◆ -7V to +12V Common-Mode Input Range
- ◆ Automotive Temperature Range (-40°C to +125°C)
- ◆ Industry-Standard Pinout

Ordering Information

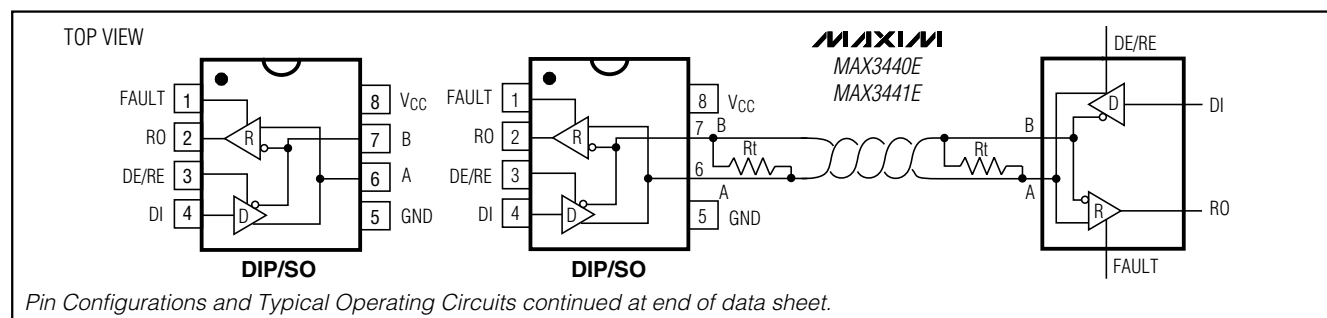

PART	TEMP RANGE	PIN-PACKAGE
MAX3440EESA	-40°C to +85°C	8 SO
MAX3440EEPA	-40°C to +85°C	8 PDIP
MAX3440EASA	-40°C to +125°C	8 SO
MAX3440EAPA	-40°C to +125°C	8 PDIP

Ordering Information continued at end of data sheet.

Selector Guide

PART	TYPE	DATA RATE (Mbps)	LOW-POWER SHUTDOWN	RECEIVER/DRIVER ENABLE	TRANSCEIVERS ON BUS	HOT SWAP
MAX3440E	RS-485	0.25	No	Yes	128	Yes
MAX3441E	RS-485	2.5 to 10	No	Yes	128	Yes
MAX3442E	RS-485	0.25	Yes	Yes	128	Yes
MAX3443E	RS-485	2.5 to 10	Yes	Yes	128	Yes
MAX3444E	J1708	0.25	Yes	Yes	128	Yes (only RE)

MAX3440E–MAX3444E

±15kV ESD-Protected, ±60V Fault-Protected, 10Mbps, Fail-Safe RS-485/J1708 Transceivers

ABSOLUTE MAXIMUM RATINGS

Voltages Referenced to GND

V _{CC}	+7V
FAULT, DE/RE, \overline{RE} , DE, \overline{DE} , DI, TXD	-0.3V to (V _{CC} + 0.3V)
A, B (Note 1)	±60V
RO	-0.3V to (V _{CC} + 0.3V)
Short-Circuit Duration (RO, A, B)	Continuous
Continuous Power Dissipation (T _A = +70°C)	
8-Pin SO (derate 5.9mW/°C above +70°C)	471mW
8-Pin PDIP (derate 9.09mW/°C above +70°C)	727mW

Operating Temperature Ranges

MAX344_EE_	-40°C to +85°C
MAX344_EA_	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature	+150°C
Lead Temperature (soldering, 10s)	+300°C

Note 1: A, B must be terminated with 54Ω or 100Ω to guarantee ±60V fault protection.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = +4.75V to +5.25V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at V_{CC} = +5V and T_A = +25°C.)

Note 2: ΔV_{OD} and ΔV_{OC} are the changes in V_{OD} and V_{OC}, respectively, when the DI input changes state.

Note 3: The short-circuit output current applies to peak current just before foldback current limiting; the short-circuit foldback output current applies during current limiting to allow a recovery from bus contention.

Detailed Description

The MAX3440E-MAX3444E fault-protected transceivers for RS-485/RS-422 and J1708 communication contain one driver and one receiver. These devices feature fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted, or when they are connected to a terminated transmission line with all drivers disabled (see the *True Fail-Safe* section). All devices have a hot-swap input structure that prevents disturbances on the differential signal lines when a circuit board is plugged into a hot back-plane (see the *Hot-Swap Capability* section). The MAX3440E/MAX3442E/MAX3444E feature a reduced slew-rate driver that minimizes EMI and reduces reflections caused by improperly terminated cables, allowing error-free data transmission up to 250kbps (see the *Reduced EMI and Reflections* section). The MAX3441E/MAX3443E drivers are not slew-rate limited, allowing transmit speeds up to 10Mbps.

Driver

The driver accepts a single-ended, logic-level input (DI) and transfers it to a differential, RS-485/RS-422 level output (A and B). Deasserting the driver enable places the driver outputs (A and B) into a high-impedance state.

Receiver

The receiver accepts a differential, RS-485/RS-422 level input (A and B), and transfers it to a single-ended, logic-level output (RO). Deasserting the receiver enable places the receiver inputs (A and B) into a high-impedance state (see Tables 1–7).

Low-Power Shutdown (MAX3442E/MAX3443E/MAX3444E)

The MAX3442E/MAX3443E/MAX3444E offer a low-power shutdown mode. Force DE low and $\overline{\text{RE}}$ high to shut down the MAX3442E/MAX3443E. Force $\overline{\text{DE}}$ and $\overline{\text{RE}}$ high to shut down the MAX3444E. A time delay of 50ns prevents the device from accidentally entering shutdown due to logic skews when switching between transmit and receive modes. Holding DE low and $\overline{\text{RE}}$ high for at least 800ns guarantees that the MAX3442E/MAX3443E enter shutdown. In shutdown, the devices consume a maximum 20μA supply current.

±60V Fault Protection

The driver outputs/receiver inputs of RS-485 devices in industrial network applications often experience voltage faults resulting from shorts to the power grid that exceed the -7V to +12V range specified in the EIA/TIA-485 standard. In these applications, ordinary RS-485 devices (typical absolute maximum -8V to +12.5V) require costly external protection devices. To reduce system complexity and eliminate this need for external protection, the driver outputs/receiver inputs of the MAX3440E-MAX3444E withstand voltage faults up to ±60V with respect to ground without damage. Protection is guaranteed regardless whether the device is active, shut down, or without power.

True Fail-Safe

The MAX3440E-MAX3444E use a -50mV to -200mV differential input threshold to ensure true fail-safe receiver inputs. This threshold guarantees the receiver outputs a logic high for shorted, open, or idle data lines. The -50mV to -200mV threshold complies with the ±200mV threshold EIA/TIA-485 standard.

±15kV ESD-Protected, ±60V Fault-Protected, 10Mbps, Fail-Safe RS-485/J1708 Transceivers

±15kV ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against ESD encountered during handling and assembly. The MAX3440E–MAX3444E receiver inputs/driver outputs (A, B) have extra protection against static electricity found in normal operation. Maxim's engineers have developed state-of-the-art structures to protect these pins against ±15kV ESD without damage. After an ESD event, the MAX3440E–MAX3444E continue working without latchup.

ESD protection can be tested in several ways. The receiver inputs are characterized for protection to ±15kV using the Human Body Model.

ESD Test Conditions

ESD performance depends on a number of conditions. Contact Maxim for a reliability report that documents test setup, methodology, and results.

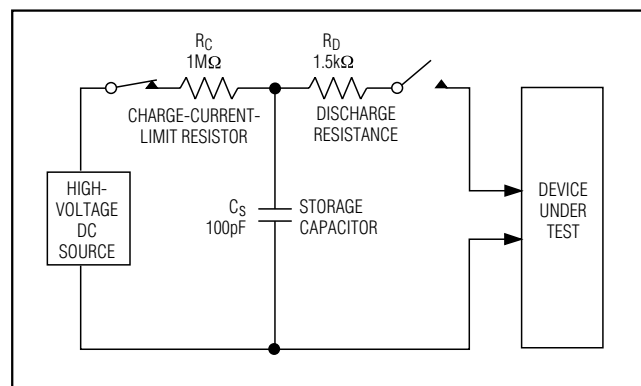

Figure 9a. Human Body ESD Test Model

Human Body Model

Figure 9a shows the Human Body Model, and Figure 9b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the device through a 1.5kΩ resistor.

Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or bus contention. The first, a foldback current limit on the driver output stage, provides immediate protection against short circuits over the whole common-mode voltage range. The second, a thermal shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature exceeds +160°C. Normal operation resumes when the die temperature cools to +140°C, resulting in a pulsed output during continuous short-circuit conditions.

Hot-Swap Capability

Hot-Swap Inputs

Inserting circuit boards into a hot, or powered, backplane may cause voltage transients on DE, DE/RE, RE, and receiver inputs A and B that can lead to data errors. For example, upon initial circuit board insertion, the processor undergoes a power-up sequence. During this period, the high-impedance state of the output drivers makes them unable to drive the MAX3440E-MAX3444E enable inputs to a defined logic level. Meanwhile, leakage currents of up to $10\mu\text{A}$ from the high-impedance output, or capacitively coupled noise from VCC or GND, could cause an input to drift to an incorrect logic state. To prevent such a condition from occurring, the MAX3440E-MAX3443E feature hot-swap input circuitry on DE, DE/RE, and RE to guard against unwanted driver activation during hot-swap situations. The MAX3444E has hot-swap input circuitry only on RE. When VCC rises, an internal pulldown (or pullup for RE) circuit holds DE low for at least $10\mu\text{s}$, and until the current into DE exceeds $200\mu\text{A}$. After the initial power-up sequence, the pulldown circuit becomes transparent, resetting the hot-swap tolerable input.

Hot-Swap Input Circuitry

At the driver-enable input (DE), there are two NMOS devices, M1 and M2 (Figure 10). When VCC ramps from zero, an internal $15\mu\text{s}$ timer turns on M2 and sets the SR latch, which also turns on M1. Transistors M2, a 2mA current sink, and M1, a $100\mu\text{A}$ current sink, pull DE to GND through a $5.6\text{k}\Omega$ resistor. M2 pulls DE to the disabled state against an external parasitic capacitance up to 100pF that may drive DE high. After $15\mu\text{s}$, the timer deactivates M2 while M1 remains on, holding DE low against three-state leakage currents that may drive DE high. M1 remains on until an external current source overcomes the required input current. At this time, the SR latch resets M1 and turns off. When M1 turns off, DE reverts to a standard, high-impedance CMOS input. Whenever VCC drops below 1V , the input is reset.

A complementary circuit for RE uses two PMOS devices to pull RE to VCC.

Applications Information

128 Transceivers on the Bus

The MAX3440E-MAX3444E transceivers $1/4$ -unit-load receiver input impedance ($48\text{k}\Omega$) allows up to 128 transceivers connected in parallel on one communication line. Connect any combination of these devices, and/or other RS-485 devices, for a maximum of 32-unit loads to the line.

Reduced EMI and Reflections

The MAX3440E/MAX3442E/MAX3444E are slew-rate limited, minimizing EMI and reducing reflections caused by improperly terminated cables. Figure 11 shows the driver output waveform and its Fourier analysis of a 125kHz signal transmitted by a MAX3443E. High-frequency harmonic components with large amplitudes are evident.

Figure 12 shows the same signal displayed for a MAX3442E transmitting under the same conditions. Figure 12's high-frequency harmonic components are much lower in amplitude, compared with Figure 11's, and the potential for EMI is significantly reduced.

Figure 10. Simplified Structure of the Driver Enable Pin (DE)

$\pm 15\text{kV}$ ESD-Protected, $\pm 60\text{V}$ Fault-Protected, 10Mbps, Fail-Safe RS-485/J1708 Transceivers

In general, a transmitter's rise time relates directly to the length of an unterminated stub, which can be driven with only minor waveform reflections. The following equation expresses this relationship conservatively:

$$\text{Length} = t_{\text{RISE}} / (10 \times 1.5\text{ns/ft})$$

where t_{RISE} is the transmitter's rise time.

For example, the MAX3442E's rise time is typically 800ns, which results in excellent waveforms with a stub length up to 53ft. A system can work well with longer unterminated stubs, even with severe reflections, if the waveform settles out before the UART samples them.

RS-485 Applications

The MAX3440E–MAX3443E transceivers provide bidirectional data communications on multipoint bus transmission lines. Figures 13 and 14 show a typical network applications circuit. The RS-485 standard covers line lengths up to 4000ft. To minimize reflections and reduce data errors, terminate the signal line at both ends in its characteristic impedance, and keep stub lengths off the main line as short as possible.

J1708 Applications

The MAX3444E is designed for J1708 applications. To configure the MAX3444E, connect $\overline{\text{DE}}$ and $\overline{\text{RE}}$ to GND. Connect the signal to be transmitted to TXD. Terminate the bus with the load circuit as shown in Figure 15. The drivers used by SAE J1708 are used in a dominant-mode application. $\overline{\text{DE}}$ is active low; a high input on $\overline{\text{DE}}$ places the outputs in high impedance. When the driver is disabled (TXD high or $\overline{\text{DE}}$ high), the bus is pulled high by external bias resistors R1 and R2. Therefore, a logic level high is encoded as recessive. When all transceivers are idle in this configuration, all receivers output logic high because of the pullup resistor on A and pulldown resistor on B. R1 and R2 provide the bias for the recessive state. C1 and C2 combine to form a 6MHz lowpass filter, effective for reducing FM interference. R2, C1, R4, and C2 combine to form a 1.6MHz lowpass filter, effective for reducing AM interference. Because the bus is unterminated, at high frequencies, R3 and R4 perform a pseudotermination. This makes the implementation more flexible, as no specific termination nodes are required at the ends of the bus.
