

1.0 General Description

The AMIS-42665 CAN transceiver is the interface between a controller area network (CAN) protocol controller and the physical bus and may be used in both 12V and 24V systems. The transceiver provides differential transmit capability to the bus and differential receive capability to the CAN controller.

The AMIS-42665 is a new addition to the CAN high-speed transceiver family and offers the following additional features:

- Ideal passive behaviour when supply voltage is removed
- Wake-up over bus
- Extremely low current standby mode

Due to the wide common-mode voltage range of the receiver inputs, the AMIS-42665 is able to reach outstanding levels of electromagnetic susceptibility (EMS). Similarly, extremely low electromagnetic emission (EME) is achieved by the excellent matching of the output signals.

2.0 Key Features

- Compatible with the ISO 11898 standard (ISO 11898-2, ISO 11898-5 and SAE J2284)
- High speed (up to 1Mbaud)
- Ideally suited for 12V and 24V industrial and automotive applications
- Extremely low current standby mode with wake-up via the bus
- Low EME common-mode choke is no longer required
- Differential receiver with wide common-mode range (+/- 35V) for high EMS
- Voltage source via V_{SPLIT} pin for stabilizing the recessive bus level (further EMC improvement)
- No disturbance of the bus lines with an un-powered node
- Transmit data (TxD) dominant time-out function
- Thermal protection
- Bus pins protected against transients in an automotive environment
- Power down mode in which the transmitter is disabled
- Bus and V_{SPLIT} pins short circuit proof to supply voltage and ground
- Logic level inputs compatible with 3.3V devices
- At least 110 nodes can be connected to the same bus.

3.0 Ordering Information

Marketing Name	Package	Temp. Range
AMIS42665AGA	SOIC 150 8 GREEN (JEDEC MS-012)	-40°C...125°C
AMIS42665ALA	SOIC 150 8 GREEN (NiPdAu, JEDEC MS-012)	-40°C...125°C

4.0 Technical Characteristics

Table 1: Technical Characteristics

Symbol	Parameter	Conditions	Min.	Max.	Unit
V_{CC}	Power supply voltage		4.75	5.25	V
V_{STB}	DC voltage at pin STB		-0.3	V_{CC}	V
V_{TxD}	DC voltage at pin TxD		-0.3	V_{CC}	V
V_{RxD}	DC voltage at pin RxD		-0.3	V_{CC}	V
V_{CANH}	DC voltage at pin CANH	$0 < V_{CC} < 5.25V$; no time limit	-35	+35	V
V_{CANL}	DC voltage at pin CANL	$0 < V_{CC} < 5.25V$; no time limit	-35	+35	V
V_{SPLIT}	DC voltage at pin V_{SPLIT}	$0 < V_{CC} < 5.25V$; no time limit	-35	+35	V
$V_{O(dif)(bus_dom)}$	Differential bus output voltage in dominant state	$42.5\Omega < R_{LT} < 60\Omega$	1.5	3	V
CM-range	Input common-mode range for comparator	Guaranteed differential receiver threshold and leakage current	-35	+35	V
$V_{CM-peak}$	Common-mode peak	See Figure 8 and 9 (Note)	-500	500	mV
C_{load}	Load capacitance on IC outputs			15	pF
$t_{pd(rec-dom)}$	Propagation delay TxD to RxD	See Figure 5	70	230	ns
Symbol	Parameter	Conditions	Min.	Max.	Unit
$t_{pd(dom-rec)}$	Propagation delay TxD to RxD	See Figure 5	100	245	ns
$V_{CM-step}$	Common-mode step	See Figure 8 and 9 (Note)	-150	150	mV
T_{junc}	Junction temperature		-40	150	°C

Note: The parameters $V_{CM-peak}$ and $V_{CM-step}$ guarantee low EME.

5.0 Block Diagram

Figure 1: Block Diagram

6.0 Typical Application

6.1 Application Schematic

6.2 Pin Description

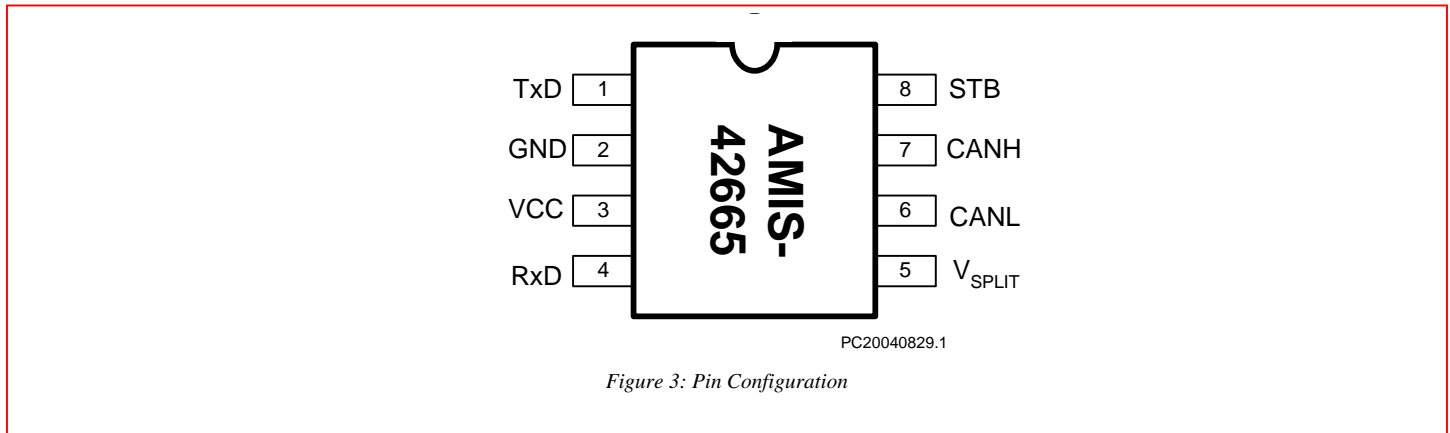

Table 2: Pinout

Pin	Name	Description
1	TxD	Transmit data input; low input => dominant driver; internal pull-up current
2	GND	Ground
3	V _{CC}	Supply voltage
4	RxD	Receive data output; dominant transmitter => low output
5	V _{SPLIT}	Common-mode stabilization output
6	CANL	Low-level CAN bus line (low in dominant mode)
7	CANH	High-level CAN bus line (high in dominant mode)
8	STB	Standby mode control input

7.0 Functional Description

7.1 Operating Modes

AMIS-42665 provides two modes of operation as illustrated in Table 3. These modes are selectable through pin STB.

Table 3: Operating Modes

Mode	Pin STB	Pin RXD	
		Low	High
Normal	Low	Bus dominant	Bus recessive
Standby	High	Wake-up request detected	No wake-up request detected

7.1.1. Normal Mode

In the normal mode, the transceiver is able to communicate via the bus lines. The signals are transmitted and received to the CAN controller via the pins TxD and RxD. The slopes on the bus lines outputs are optimized to give extremely low EME.

7.1.2. Standby Mode

In standby mode both the transmitter and receiver are disabled and a very low-power differential receiver monitors the bus lines for CAN bus activity. The bus lines are terminated to ground and supply current is reduced to a minimum, typically 10µA. When a wake-up request is detected by the low-power differential receiver, the signal is first filtered and then verified as a valid wake signal after a time period of t_{BUS} , the RxD pin is driven low by the transceiver to inform the controller of the wake-up request.

7.2 Split Circuit

The V_{SPLIT} pin is operational only in normal mode. In standby mode this pin is floating. The V_{SPLIT} is connected as shown in Figure 2 and its purpose is to provide a stabilized DC voltage of $0.5 \times V_{CC}$ to the bus avoiding possible steps in the common-mode signal therefore reducing EME. These unwanted steps could be caused by an un-powered node on the network with excessive leakage current from the bus that shifts the recessive voltage from its nominal $0.5 \times V_{CC}$ voltage.

7.3 Wake-up

Once a valid wake-up (dominant state longer than t_{BUS}) has been received during the standby mode the RxD pin is driven low.

7.4 Over-temperature Detection

A thermal protection circuit protects the IC from damage by switching off the transmitter if the junction temperature exceeds a value of approximately 160°C. Because the transmitter dissipates most of the power, the power dissipation and temperature of the IC is reduced. All other IC functions continue to operate. The transmitter off-state resets when pin TxD goes high. The thermal protection circuit is particularly needed when a bus line short circuits.

7.5 TxD Dominant Time-out Function

A TxD dominant time-out timer circuit prevents the bus lines being driven to a permanent dominant state (blocking all network communication) if pin TxD is forced permanently low by a hardware and/or software application failure. The timer is triggered by a negative edge on pin TxD. If the duration of the low-level on pin TxD exceeds the internal timer value t_{dom} , the transmitter is disabled, driving the bus into a recessive state. The timer is reset by a positive edge on pin TxD.

This TxD dominant time-out time (t_{dom}) defines the minimum possible bit rate to 40kbaud.

7.6 Fail Safe Features

A current-limiting circuit protects the transmitter output stage from damage caused by accidental short circuit to either positive or negative supply voltage, although power dissipation increases during this fault condition.

The pins CANH and CANL are protected from automotive electrical transients (according to ISO 7637; see Figure 4). Pins TxD and STB are pulled high internally should the input become disconnected. Pins TxD, STB and RxD will be floating, preventing reverse supply should the V_{CC} supply be removed.

8.0 Electrical Characteristics

8.1 Definitions

All voltages are referenced to GND (pin 2). Positive currents flow into the IC. Sinking current means the current is flowing into the pin; sourcing current means the current is flowing out of the pin.

8.2 Absolute Maximum Ratings

Stresses above those listed in the following table may cause permanent device failure. Exposure to absolute maximum ratings for extended periods may effect device reliability.

Table 4: Absolute Maximum Ratings

Symbol	Parameter	Conditions	Min.	Max.	Unit
V_{CC}	Supply voltage		-0.3	+7	V
V_{CANH}	DC voltage at pin CANH	$0 < V_{CC} < 5.25V$; no time limit	-50	+50	V
V_{CANL}	DC voltage at pin CANL	$0 < V_{CC} < 5.25V$; no time limit	-50	+50	V
V_{SPLIT}	DC voltage at pin VSPLIT	$0 < V_{CC} < 5.25V$; no time limit	-50	+50	V
V_{TxD}	DC voltage at pin TxD		-0.3	$V_{CC} + 0.3$	V
V_{RxD}	DC voltage at pin RxD		-0.3	$V_{CC} + 0.3$	V
V_{STB}	DC voltage at pin STB		-0.3	$V_{CC} + 0.3$	V
$V_{tran}(CANH)$	Transient voltage at pin CANH	Note 1	-300	+300	V
$V_{tran}(CANL)$	Transient voltage at pin CANL	Note 1	-300	+300	V
$V_{tran}(VSPLIT)$	Transient voltage at pin VSPLIT	Note 1	-300	+300	V
$V_{esd}(CANL/CANH/VSPLIT)$	Electrostatic discharge voltage at CANH and CANL pin	Note 2 Note 4	-8 -500	+8 +500	kV V
V_{esd}	Electrostatic discharge voltage at all other pins	Note 2 Note 4	-5 -500	+5 +500	kV V
Latch-up	Static latch-up at all pins	Note 3		120	mA
T_{stg}	Storage temperature		-55	+150	°C
T_{amb}	Ambient temperature		-40	+125	°C
T_{junc}	Maximum junction temperature		-40	+170	°C

Notes:

- 1) Applied transient waveforms in accordance with ISO 7637 part 3, test pulses 1, 2, 3a, and 3b (see Figure 4).
- 2) Standardized human body model electrostatic discharge (ESD) pulses in accordance to MIL883 method 3015.7.
- 3) Static latch-up immunity: Static latch-up protection level when tested according to EIA/JESD78.
- 4) Standardized charged device model ESD pulses when tested according to EOS/ESD DS5.3-1993.

8.3 Thermal Characteristics

Table 5: Thermal Characteristics

Symbol	Parameter	Conditions	Value	Unit
$R_{th}(j-a)$	Thermal resistance from junction to ambient in SO8 package	In free air	145	K/W
$R_{th}(j-s)$	Thermal resistance from junction to substrate of bare die	In free air	45	K/W

8.4 Characteristics

$V_{CC} = 4.75$ to $5.25V$; $T_{junc} = -40$ to $+150^{\circ}C$; $R_{LT} = 60\Omega$ unless specified otherwise.

Table 6: Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
Supply (pin V_{CC})						
I_{CC}	Supply current	Dominant; $V_{TXD} = 0V$ Recessive; $V_{TXD} = V_{CC}$		45 4	65 8	mA mA
I_{CCS}	Supply current in standby mode	$T_{junc,max} = 100^{\circ}C$		10	15	μA
Transmitter Data Input (pin TxD)						
V_{IH}	High-level input voltage	Output recessive	2.0	-	$V_{CC} + 0.3$	V
V_{IL}	Low-level input voltage	Output dominant	-0.3	-	+0.8	V
I_{IH}	High-level input current	$V_{TXD} = V_{CC}$	-5	0	+5	μA
I_{IL}	Low-level input current	$V_{TXD} = 0V$	-75	-200	-350	μA
C_i	Input capacitance	Not tested	-	5	10	pF
Transmitter Mode Select (pin STB)						
V_{IH}	High-level input voltage	Standby mode	2.0	-	$V_{CC} + 0.3$	V
V_{IL}	Low-level input voltage	Normal mode	-0.3	-	+0.8	V
I_{IH}	High-level input current	$V_{STB} = V_{CC}$	-5	0	+5	μA
I_{IL}	Low-level input current	$V_{STB} = 0V$	-1	-4	-10	μA
C_i	Input capacitance	Not tested	-	5	10	pF
Receiver Data Output (pin RxD)						
V_{OH}	High-level output voltage	$I_{RxD} = -10mA$	$0.6 \times V_{CC}$		$0.75 \times V_{CC}$	V
V_{OL}	Low-level output voltage	$I_{RxD} = 5mA$		0.25	0.45	V
I_{oh}	High-level output current	$V_o = 0.7 \times V_{CC}$	-5	-10	-15	mA
I_{ol}	Low-level output current	$V_o = 0.3 \times V_{CC}$	5	10	15	mA
Bus Lines (pins $CANH$ and $CANL$)						
$V_{o(reces)}(norm)$	Recessive bus voltage	$V_{TXD} = V_{CC}$; no load normal mode	2.0	2.5	3.0	V
$V_{o(reces)}(stby)$	Recessive bus voltage	$V_{TXD} = V_{CC}$; no load standby mode	-100	0	100	mV
$I_{o(reces)}(CANH)$	Recessive output current at pin $CANH$	$-35V < V_{CANH} < +35V$; $0V < V_{CC} < 5.25V$	-2.5	-	+2.5	mA
$I_{o(reces)}(CANL)$	Recessive output current at pin $CANL$	$-35V < V_{CANL} < +35V$; $0V < V_{CC} < 5.25V$	-2.5	-	+2.5	mA
$V_{o(dom)}(CANH)$	Dominant output voltage at pin $CANH$	$V_{TXD} = 0V$	3.0	3.6	4.25	V
$V_{o(dom)}(CANL)$	Dominant output voltage at pin $CANL$	$V_{TXD} = 0V$	0.5	1.4	1.75	V
$V_{o(dif)}(bus_dom)$	Differential bus output voltage ($V_{CANH} - V_{CANL}$)	$V_{TXD} = 0V$; dominant; $42.5\Omega < R_{LT} < 60\Omega$	1.5	2.25	3.0	V
$V_{o(dif)}(bus_rec)$	Differential bus output voltage ($V_{CANH} - V_{CANL}$)	$V_{TXD} = V_{CC}$; recessive; no load	-120	0	+50	mV
$I_{o(sc)}(CANH)$	Short circuit output current at pin $CANH$	$V_{CANH} = 0V$; $V_{TXD} = 0V$	-45	-70	-120	mA
$I_{o(sc)}(CANL)$	Short circuit output current at pin $CANL$	$V_{CANL} = 36V$; $V_{TXD} = 0V$	45	70	120	mA
$V_{i(dif)}(th)$	Differential receiver threshold voltage (see Figure 5)	$-5V < V_{CANL} < +12V$; $-5V < V_{CANH} < +12V$;	0.5	0.7	0.9	V
$V_{ihcm(dif)}(th)$	Differential receiver threshold voltage for high common-mode (see Figure 5)	$-35V < V_{CANL} < +35V$; $-35V < V_{CANH} < +35V$;	0.40	0.7	1.00	V
$V_{i(dif)}(hys)$	Differential receiver input voltage hysteresis (see Figure 5)	$-35V < V_{CANL} < +35V$; $-35V < V_{CANH} < +35V$;	50	70	100	mV
$R_{i(cm)}(CANH)$	Common-mode input resistance at pin $CANH$		15	26	37	$K\Omega$
$R_{i(cm)}(CANL)$	Common-mode input resistance at pin $CANL$		15	26	37	$K\Omega$
$R_{i(cm)}(m)$	Matching between pin $CANH$ and pin $CANL$ common mode input resistance	$V_{CANH} = V_{CANL}$	-3	0	+3	%
$R_{i(dif)}$	Differential input resistance		25	50	75	$K\Omega$
$C_{i(CANH)}$	Input capacitance at pin $CANH$	$V_{TXD} = V_{CC}$; not tested		7.5	20	pF
$C_{i(CANL)}$	Input capacitance at pin $CANL$	$V_{TXD} = V_{CC}$; not tested		7.5	20	pF
$C_{i(dif)}$	Differential input capacitance	$V_{TXD} = V_{CC}$; not tested		3.75	10	pF

Table 6: Characteristics (Continued)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
Common-mode Stabilization (pin V_{SPLIT})						
V _{SPLIT}	Reference output voltage at pin V _{SPLIT}	Normal mode; -500μA < I _{SPLIT} < 500μA	0.3 x V _{CC}	-	0.7 x V _{CC}	
I _{SPLIT(i)}	V _{SPLIT} leakage current	Standby mode	-5		+5	μA
I _{SPLIT(lim)}	V _{SPLIT} limitation current	Normal mode	-3		+3	mA
Power-on-Reset (POR)						
PORL	POR level	CANH, CANL, V _{ref} in tri-state below POR level	2.2	3.5	4.7	V
Thermal Shutdown						
T _{l(sd)}	Shutdown junction temperature		150	160	180	°C
Timing Characteristics (see Figure 4 and Figure 5)						
t _{d(TxD-BUSon)}	Delay TXD to bus active	C _l = 100pF between CANH to CANL	40	85	105	ns
t _{d(TxD-BUSoff)}	Delay TXD to bus inactive	C _l = 100pF between CANH to CANL	30	60	105	ns
t _{d(BUSon-RXD)}	Delay bus active to RXD	C _{rxd} = 15pF	25	55	105	ns
t _{d(BUSoff-RXD)}	Delay bus inactive to RXD	C _{rxd} = 15pF	40	100	105	ns
t _{pd(rec-dom)}	Propagation delay TXD to RXD from recessive to dominant	C _l = 100pF between CANH to CANL	90		230	ns
t _{d(dom-rec)}	Propagation delay TXD to RXD from dominant to recessive	C _l = 100pF between CANH to CANL	90		245	ns
t _{d(stb-nm)}	Delay standby mode to normal mode		5	7.5	10	μs
t _{dbus}	Dominant time for wake-up via bus		0.75	2.5	5	μs
t _{dom(TxD)}	TxD dominant time for time out	V _{TxD} = 0V	300	650	1000	μs

10.0 Soldering

10.1 Introduction to Soldering Surface Mount Packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in the AMIS “Data Handbook IC26; Integrated Circuit Packages” (document order number 9398 652 90011). There is no soldering method that is ideal for all surface mount IC packages. Wave soldering is not always suitable for surface mount ICs, or for printed-circuit boards with high population densities. In these situations reflow soldering is often used.

10.2 Re-flow Soldering

Re-flow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Several methods exist for re-flowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method. Typical re-flow peak temperatures range from 215 to 250°C. The top-surface temperature of the packages should preferably be kept below 230°C.

10.3 Wave Soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems. To overcome these problems the double-wave soldering method was specifically developed. If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - Larger than or equal to 1.27mm, the footprint longitudinal axis is preferred to be parallel to the transport direction of the printed circuit board;
 - Smaller than 1.27mm, the footprint longitudinal axis must be parallel to the transport direction of the printed circuit board. The footprint must incorporate solder thieves at the downstream end.
- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured. Typical dwell time is four seconds at 250°C. A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

10.4 Manual Soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300°C. When using a dedicated tool, all other leads can be soldered in one operation within two to five seconds between 270 and 320°C.

Package	Soldering Method	
	Wave	Re-flow(1)
BGA, SQFP	Not suitable	Suitable
HLQFP, HSQFP, HSOP, HTSSOP, SMS	Not suitable (2)	Suitable
PLCC (3) , SO, SOJ	Suitable	Suitable
LQFP, QFP, TQFP	Not recommended (3)(4)	Suitable
SSOP, TSSOP, VSO	Not recommended (5)	Suitable

- Notes
1. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods.
 2. These packages are not suitable for wave soldering as a solder joint between the printed-circuit board and heatsink (at bottom version) can not be achieved, and as solder may stick to the heatsink (on top version).
 3. If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
 4. Wave soldering is only suitable for LQFP, TQFP and QFP packages with a pitch (e) equal to or larger than 0.8mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65mm.
 5. Wave soldering is only suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5mm.
