## 6-Channel, Muxed Input Line Inversion LCD Gamma Buffer

## FEATURES

Single-supply operation: 3.3 V to 6.5 V
Rail-to-rail input, rail-to-rail output
High output current: $\mathbf{3 8 0} \mathbf{~ m A}$
Low supply current: 3.9 mA
Stable with 1 nF loads
Wide temperature range: $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$
24-lead, Pb -free, TSSOP package

## APPLICATIONS

LCD line inversion gamma references
Car navigation panels
Personal media player panels

## GENERAL DESCRIPTION

The ADD8506 has 6-channel LCD gamma reference buffers designed to drive column driver gamma inputs in line inversion panels. Each buffer channel has an A/B input to select between two gamma voltage curves. These buffer channels drive the resistor ladders of LCD column drivers for gamma correction. The ADD8506 outputs have high slew rates and output drives that increase the stability of the reference ladder, resulting in optimal gray scale and visual performance.

The ADD8506 is specified over the $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ temperature range. It is available in a 24 -lead thin shrink small outline (TSSOP), surface-mount, Pb -free package.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameter | Rating |
| :--- | :--- |
| Supply Voltage | 7 V |
| Input Voltage | GND to V cc |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Junction Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Lead Temperature (Soldering, 60 sec ) | $300^{\circ} \mathrm{C}$ |

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE
Table 3. Thermal Package Characteristics

| Model | Package Type | $\boldsymbol{\theta}_{\mathbf{J A}}{ }^{\mathbf{1}}$ | $\boldsymbol{\theta}_{\mathbf{\prime} \mathbf{c}^{\mathbf{2}}}$ | Unit |
| :--- | :--- | :--- | :--- | :--- |

${ }^{3}$ Field induced charge device model.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## ADD8506

## APPLICATIONS

The ADD8506 has CMOS buffers with A/B inputs to select between two different reference voltages set up by an external resistor ladder. Input bias currents are orders of magnitude less than competitive parts. This allows the use of a very large resistor ladder to save supply current.

The buffer outputs are designed to drive resistive or capacitive loads. Therefore, to attain the best display performance, do not use resistors in series with these outputs. Outputs have high slew rates and $6 \mu$ settling times. Each output delivers a minimum of 120 mA , ensuring a fast response to varying loads.

Power supply pins on the ADD8506 have multiple ground (GND) and supply ( $\mathrm{V}_{\mathrm{CC}}$ ) connections. Because of the high peak currents that these buffers deliver, it is recommended that all GND and VCC pins be connected and suitably bypassed.

Table 5. MUX Function

| A/B Select | Input |
| :--- | :--- |
| Logic High | INAx |
| Logic Low | INBx |

NOTES

1. RAx RESISTORS ARE USED TO SET POSITIVE INVERSION GAMMA VOLTAGES. 2. RBx RESISTORS ARE USED TO SET NEGATIVE INVERSION GAMMA VOLTAGES.
