

## HORIZONTAL AND VERTICAL DEFLECTION MONITOR

- DIRECT LINE DARLINGTON DRIVE
- DIRECT FRAME-YOKE DRIVE ( $\pm 1\text{ A}$ )
- COMPOSITE VIDEO SIGNAL INPUT CAPABILITY
- FRAME OUTPUT PROTECTION AGAINST SHORT CIRCUITS
- PLL
- HORIZONTAL OSCILLATOR FREQUENCY RANGE FROM 15kHz TO 100kHz
- VERTICAL OSCILLATOR FREQUENCY RANGE FROM 30Hz TO 120Hz
- VERY FEW EXTERNAL COMPONENT
- VERY LOW COST POWER PACKAGE

**POWERDIP (8+8)**  
 (Plastic Package)

**ORDER CODE : TEA2037A**

### DESCRIPTION

The TEA2037A is an horizontal and vertical deflection circuit. It uses the same concept as TEA2117 but optimised for small screens, for a very low cost solution.

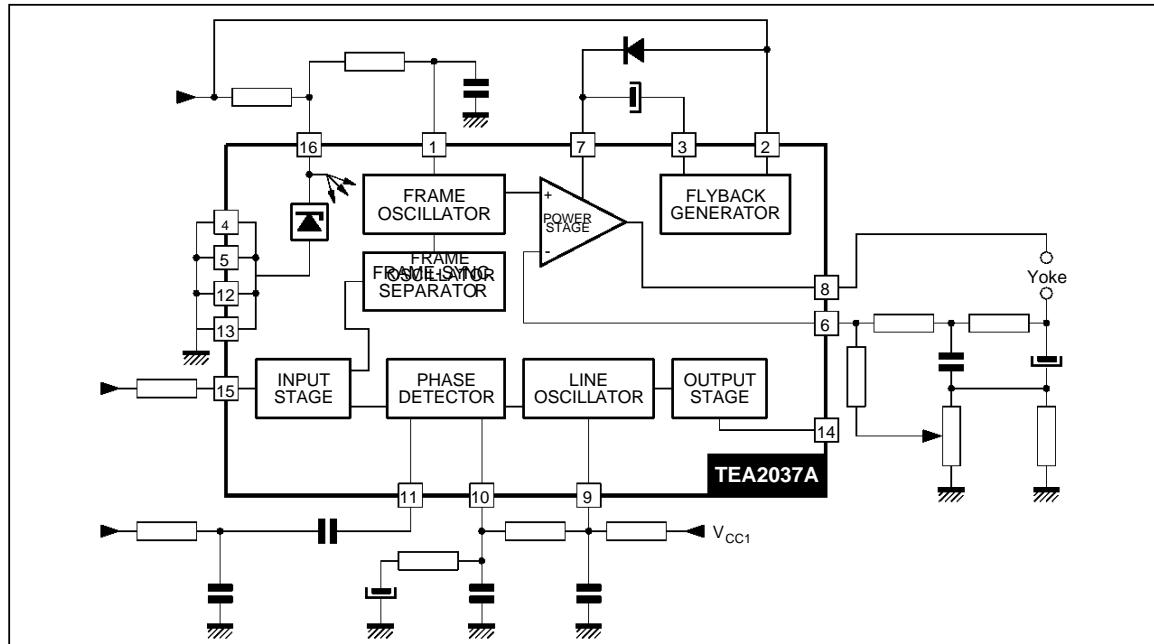

### PIN CONNECTIONS

The TEA2037A performs all the video and power functions required to provide signals for the direct drive of the line darlington and frame yoke.

It contains :

- A shunt regulator
- A synchronization separator
- An integrated frame separator without external components
- A saw-tooth generator for the frame
- A power amplifier for direct drive of frame yoke (short circuit protected)
- An open collector output for the line darlington drive
- A line phase detector and a voltage control oscillator

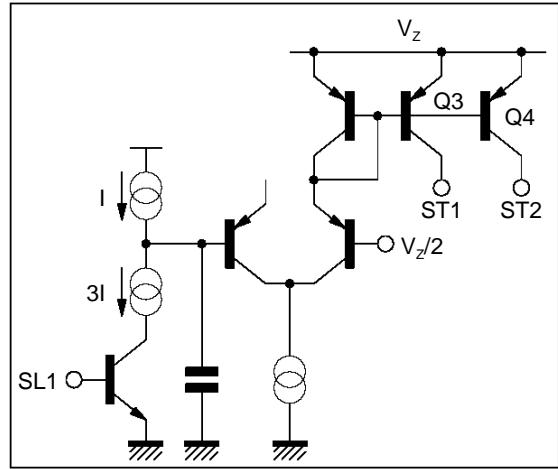

Figure 1 : Synchronization Separator Circuit

The slice level of sync-separation is fixed by value of the external resistors  $R_1$  and  $R_2$ .  $V_R$  is an internally fixed voltage.

The sync-pulse allows the discharge of the capacitor by a  $2 \times 1$  current. A line sync-pulse is not able to discharge the capacitor under  $V_Z/2$ . A frame sync pulse permits the complete discharge of the capacitor, so during the frame sync-pulse Q3 and Q4 provide current for the other parts of the circuit.

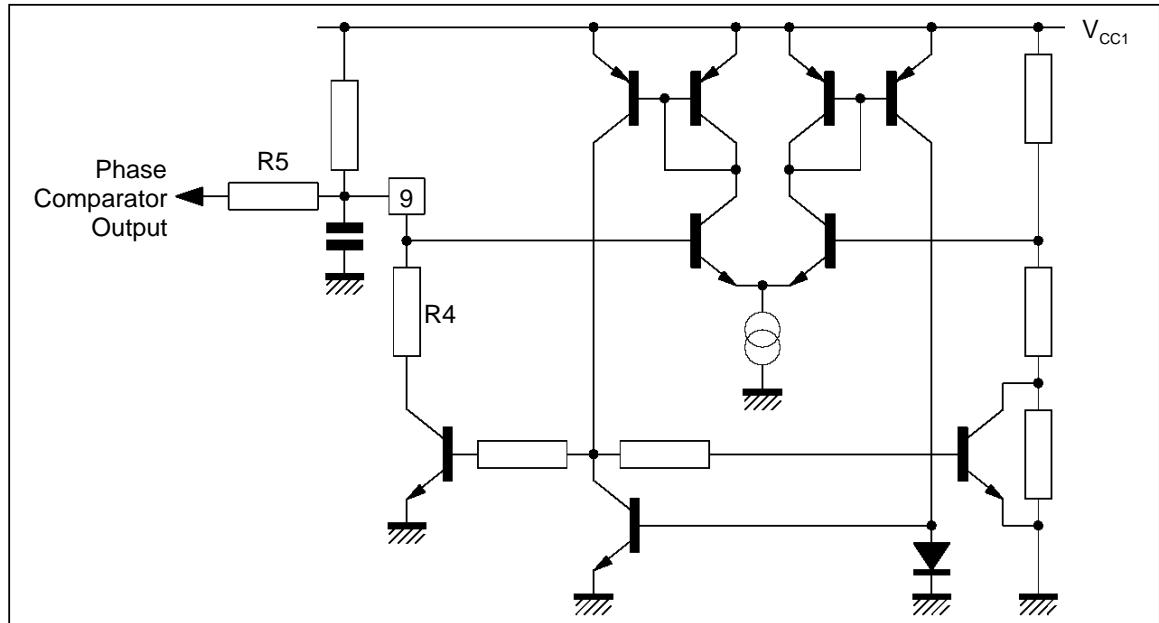

Figure 2 : Frame Separator

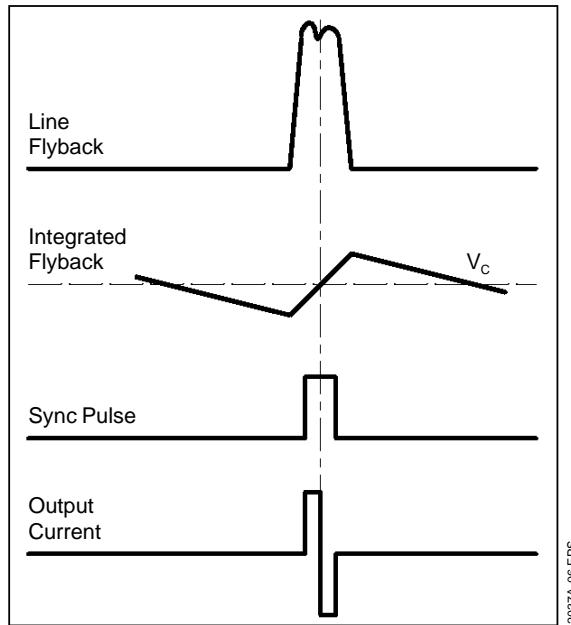

2037A-04.TBL

The oscillator thresholds are internally fixed by resistors. The discharge of the capacitor depends on the internal resistor  $R_4$ . The control voltage is applied on resistor  $R_5$ .

**Figure 3 : Line Oscillator**

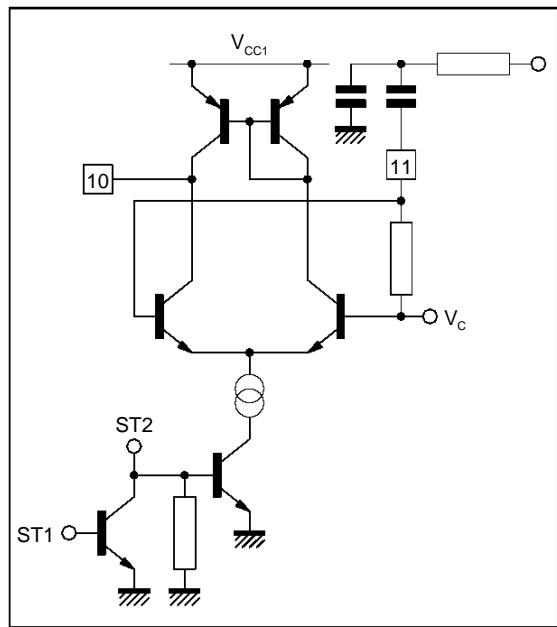

**Figure 4 : Phase Comparator**

The sync-pulse drives the current in the comparator. The line flyback integrated by the external network gives on pin 11 a saw tooth, the DC offset of this saw tooth is fixed by VC. The comparator output provides a positive current for the part of the signal on pin 11 greater than to VC and a negative

current for the other part. When the line flyback and the video signal are synchronized, the output of the comparator is an alternatively negative and positive current. The frame sync-pulse inhibits the comparator to prevent frequency drift of the line oscillator on the frame beginning.

**Figure 5**

**Line Output (pin 14)**

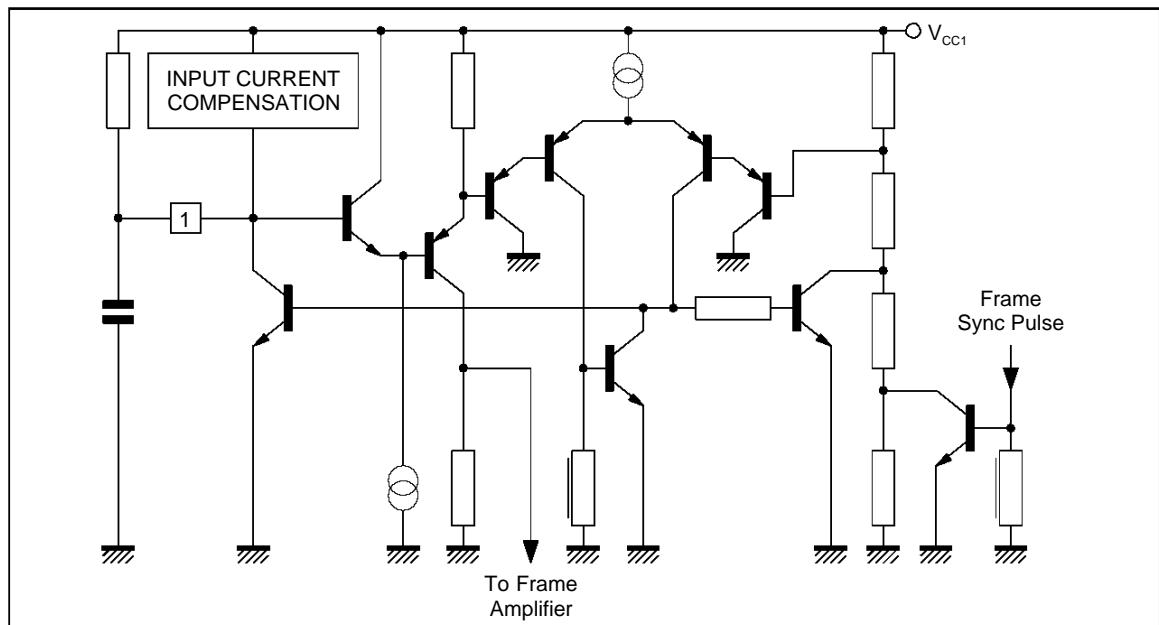

It is an open collector output which is able to drive pulse current of 800mA for a rapid discharging of the darlington base. The output pulse time is 22 $\mu$ s for a 64 $\mu$ s period.

The oscillator thresholds are internally fixed by resistors. The oscillator is synchronized during the

last half free run period. The input current during the charge of the capacitor is less than 100nA.

**Frame Output Amplifier**

This amplifier is able to drive directly the frame yoke. Its output is short circuit and overload protected ; it contains also a thermal protection.
