

LOW DROP-OUT 5V DUAL VOLTAGE REGULATOR

- OUTPUT CURRENT OF BOTH REGULATORS : 100 mA GUARANTEED
- INTERNAL SHORT-CIRCUIT AND THERMAL PROTECTION
- FIRST REGULATOR OUTPUT : LOW DISCHARGE CURRENT
- SECOND REGULATOR OUTPUT : SWITCHED-OFF WITH ACTIVE DISCHARGE
- RESET OUTPUT WITH ADJUSTABLE PULSE WIDTH

The circuit generates a reset pulse when :

- the supply voltage is applied to the circuit and the output of the second regulator is at its nominal value, and
- when the output of the second regulator is at its nominal value again after a shut-down on the output of the first regulator (see figure 2 page 4).

DESCRIPTION

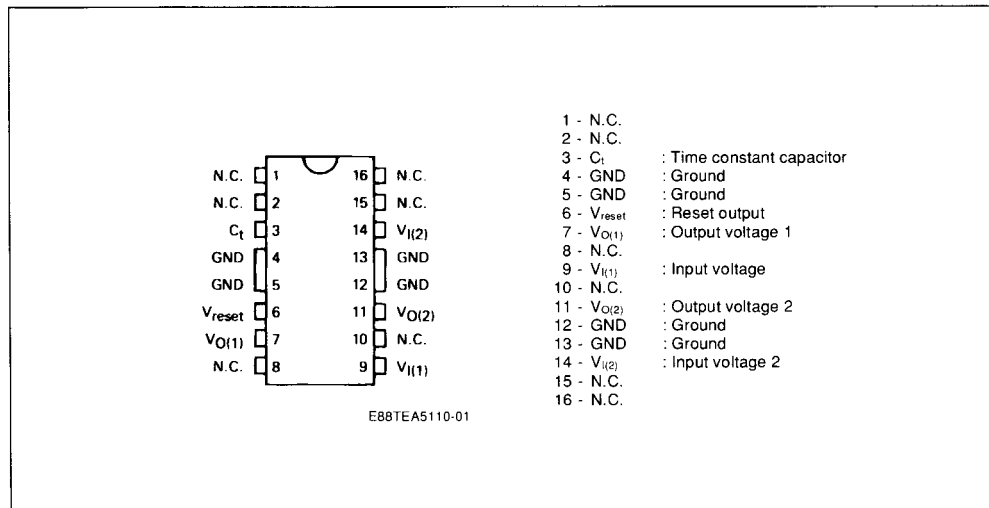

The TEA5110 is a dual positive 5V voltage regulator specially designed to supply a microprocessor and associated circuits.

The first regulator supplies the microprocessor in normal operating conditions. In standby mode, the regulator has a very high output impedance (current drain less than 1 μ A) and the microprocessor may be powered by a battery.

The second regulator supplies the peripherals and provides a halt signal to the microprocessor to turn it in standby mode.

Symbol	Parameter	Value	Unit
V_I	Input Voltage	20	V
I_O	Output Current	Internally Limited	A
P_{tot}	Power Dissipation	Internally Limited	W
T_{oper}	Operating Ambient Temperature Range	0 to 70	°C
T_{stg}	Storage Temperature Range	- 65 to 150	°C

THERMAL DATA

$R_{th(j-a)}$ *	Junction-ambient Thermal Resistance	45	°C/W
$R_{th(j-c)}$	Junction-case Thermal Resistance	11	°C/W

* The $R_{th(j-a)}$ is measured on devices soldered on 35 μ m thick copper surface of 40 cm².

- Notes :**
- The dropout voltage (input-output voltage difference) is measured when the output voltage has dropped 100 mV from the nominal value obtained at 10 V input voltage.
Dropout voltage is dependent upon load current and junction temperature.
 - $V_{O(1)}$ voltage is measured at 10 V input voltage.
 - t_{reset} (ms) = 0.8 C_{reset} (nF).
