

Low Distortion Ultrahigh Speed Differential ADC Driver

Preliminary Technical Data

ADA4960-1

FEATURES

Adjustable output common-mode voltage **Externally adjustable gain** -3 dB bandwidth of 3GHz, (all gains) Low harmonic distortion (H2/H3 SE->DIFF)

-77/-67 dBc@250 MHz

-69/-63 dBc@500 MHz

-52/-63 dBc@1GHz

IMD3 @ 1GHz = 67dBc

Slew rate 8000 V/µs

Fast overdrive recovery of 1 ns

Low input voltage noise of 3.6 nV/√Hz

Low power dissipation: 60 mA quiescent current

0.1 dB gain flatness to TBD MHz

Available in 16-Lead and 24-Lead LFSCP packages

APPLICATIONS

ADC drivers for giga-sample ADCs Single-ended-to-differential converters RF/IF gain block **Line drivers** Oscilloscopes **Satellite Communications Data Acquisition Electronic Surveillance and Countermeasures**

www.Datasileer41...msCRIPTION

The ADA4960-1 is a high performance differential amplifier optimized for RF and IF applications. It achieves better than 63dB SFDR performance at frequencies up to 500 MHz, and 52dB up to 1GHz, making it an ideal driver for high speed 8-bit to 10-bit giga-sample analog-to-digital converters (ADCs).

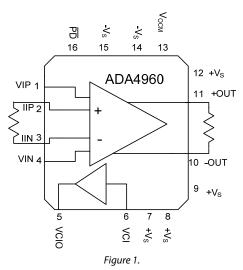

Unlike other wideband differential amplifiers, the ADA4960-1 has buffered inputs that isolate the gain-setting resistor (RG) from the signal inputs. As a result, the ADA4960-1 maintains a constant 10 k Ω differential input resistance for gains of 6 dB to 15 dB, easing matching and input drive requirements. The ADA4960-1 has a nominal 150 Ω differential output resistance.

The device is optimized for wideband, low distortion performance at frequencies up to and beyond 1 GHz. These attributes, together with its wide gain adjust capability make this device the amplifier of choice for general-purpose IF and broadband applications where low distortion, noise, and power are critical.

PIN CONFIGURATION

The device also includes a unity gain buffer, for the buffering of DC signals such as the common-mode-input to the amplifier. This buffer is found between pins 6 (input) and pin5 (output). If this buffer is not used, the output can be left disconnected and the input can be grounded.

It is ideally suited for driving not only ADCs, but also mixers, pin diode attenuators, SAW filters, and multi-element discrete devices, as well as buffering high frequency DACs. The device will be available in a single channel version in 3 mm ×3 mm, 16-lead LFCSP package or a dual channel version in 4 mm x 4 mm, 24-lead LFSCP. The device operates over a temperature range of -40°C to +105°C.

PIN CONFIGURATION AND FUNCTION DESCRIPTION

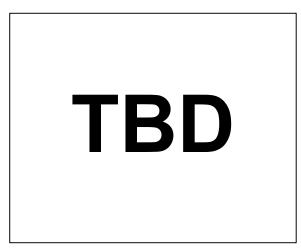

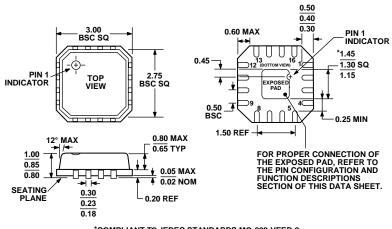

Figure 2. Pin Configuration

Table 2. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	VIP	Balanced Differential Input. Biased to VCOM.
2	IIP	Gain setting input, positive side. A resistor from this pin to pin 3 sets the gain for the device.
3	IIN	Gain setting input, negative side. A resistor from this pin to pin 3 sets the gain for the device
4	VIN	Balanced Differential Input. Biased to VCOM.
5	VCIO	Common Mode buffer output.
6	VCI	Common Mode buffer input
7, 8, 9, 12	+Vs	Positive Supply.
10	VON	Balanced Differential Output. Biased to VCOM, typically ac-coupled.
.DataSheet4U.con	VOP	Balanced Differential Output. Biased to VCOM, typically ac-coupled.
13	VC0M	Common-Mode Voltage. A voltage applied to this pin sets the common-mode voltage of the input and output. Typically decoupled to ground with a 0.1 µF capacitor. With no reference applied, input and output common mode floats to midsupply (VCC/2).
16	PD	Enable. Apply positive voltage (1.3 V < ENB < VCC) to activate device.
13, 14, 15, 16	GND	Ground. Connect to low impedance GND.
