MICROTUNE™

MT1530 Upstream Amplifier Advance Data Sheet

CATV APPLICATIONS

1 APPLICATIONS

- Cable modems
- Telephony over cable
- Set-top box CATV

2 FEATURES

- Lowest power consumption upstream amplifier available
- Maximum output level of 64 dBmV
- Low power-up/down transients of 4 mVp-p typical at 59 dBmV output
- Best in class second harmonic distortion
- Ultra low third harmonic distortion
- Single +5V supply
- 63-dB Gain range
- Gain programmable in 1-dB steps
- Low transmit output noise floor: 131 nV / √Hz
- Low transmit-disable output noise: 810 pV / √Hz
- Two power-down modes
- DOCSIS and EuroDOCSIS compatible

3 OVERVIEW

The Microtune 1530 (MT1530) is a low-cost programmable-gain power amplifier IC for use in CATV upstream applications. Specifically, the MT1530 is optimized for the DOCSIS upstream standard.

The device operates at a frequency range from 5 MHz to 65 MHz, and can output 64 dBmV through a 4:1 impedance-ratio transformer. Second harmonic distortion is typically less than -70 dBc, and third harmonic distortion is typically less than -55 dBc at a 59 dBmV output level. A 3-wire digital serial bus controls the variable gain, with gain control available in 1-dB steps and a nominal 63-dB gain range.

The MT1530 may be disabled via an external control pin. The transmit-disable mode not only minimizes output noise by shutting off the output stage, but also maintains its output impedance at nominal levels. Output glitch transients are nominally less than 4 mV at maximum gain settings during transmit enable/disable switching.

Operating from a single +5V supply, the amplifier's typical current draw at maximum gain, or minimum attenuation, is 102 mA. Additionally, internal circuitry reduces the amplifier's power consumption depending on gain setting. Transmit-disable mode power supply current is reduced to a nominal of 14 mA. A shutdown mode further reduces current to a nominal of 130 μ A.

The MT1530 is available in a 20-pin SSOP package for the extended industrial temperature range of -40°C to +85°C.

4 ABSOLUTE MAXIMUM RATINGS

Stresses greater than those listed in Table 1 may cause permanent damage to the device. These are stress ratings only; functional operation of the device under conditions other than those listed in the operational sections of this document is not recommended or implied. Exposure to any of the absolute-maximum rating conditions for extended periods of time may affect reliability.

Table 1 Stress Ratings

Parameter	Min	Мах	Unit
V _{CC} (V _{CC1} , V _{CC2})	-0.7	6	V
V _{OUT+} , V _{OUT-}	-0.7	7.5	V
Input voltage levels (all inputs), VCM	-0.7	V _{CC} + 0.7	V
Junction temperature		+150	°C
Storage temperature range	-55	+150	°C
Lead temperature (soldering, 10 seconds)		+300	°C

5 DC ELECTRICAL CHARACTERISTICS

The DC electrical characteristics listed in Table 2 are valid for the following conditions unless otherwise noted. Typical parameters are at $T_A = +25^{\circ}C$.

- $V_{CC} = +4.75V \text{ to } +5.25V$
- TXEN = high
- D7 = 1
- $T_A = -40^{\circ}C \text{ to } +85^{\circ}C$

Table 2 DC Electrical Characteristics

Para	Symbol	Min	Түр	Мах	Unit	
Supply voltage	V _{CC}	4.75		5.25	V	
	Gain code = 52 to 63	I _{cc} 5	102	129		
Supply current, transmit mode	Gain code = 46 to 51			59	75	mA
	Gain code = 45 to 0			37	47	
Supply current, transmit-disable mode (TXEN = low)		I _{cc}		14	19	mA
Supply current, shutdown mode (D7 = 0 or $\overline{SHDN} = 0$)		I _{cc}		131	164	μΑ
Input high voltage		V _{IH}	2.0			V
Input low voltage		V _{IL}			0.8	V
Input high current	I _{IH}		0		μΑ	
Input low current		I _{IL}		0		μA

6 AC ELECTRICAL CHARACTERISTICS

The AC electrical characteristics listed in Table 3 are valid for the following conditions unless otherwise noted. Typical parameters are at $T_A = +25^{\circ}C$.

- $V_{CC} = +4.75V \text{ to } +5.25V$
- TXEN = \overline{SHDN} = high
- D7 = 1
- V_{IN} = 33 dBmV differential
- Output impedance = 75Ω through a 4:1 impedance transformer
- $T_A = -40^{\circ}C \text{ to } +85^{\circ}C$

Table 3 AC Electrical Characteristics of the MT1530

7 TYPICAL PERFORMANCE

The following data is representative of a part measured in a typical application circuit.

- 4:1 impedance ratio balun on the output
- $Z_{\text{load}} = 75\Omega$, Vcc = 5V
- $T_A = 25^{\circ}C$

CATV APPLICATIONS

8 DETAILED DESCRIPTION

This section describes the MT1530 functional blocks shown in Figure 12.

Figure 12 MT1530 Amplifier Block Diagram

8.1 FUNCTIONAL MODES

The MT1530 amplifier has three functional modes controlled through the serial interface or external pins: transmit mode, transmit-disable mode, and shutdown mode.

8.1.1 TRANSMIT MODE

Transmit mode is the normal active mode of the MT1530. The TXEN and SHDN pins must be held high in this mode.

8.1.2 TRANSMIT-DISABLE MODE

Transmit-disable mode is typically used between bursts in TDMA systems. This mode shuts off the power amplifier while keeping the input amplifier and variable attenuator powered up. Taking TXEN low while keeping \overline{SHDN} high and D7 = 1 (see Table 5) activates this mode.

8.1.3 SHUTDOWN MODE

Shutdown mode minimizes current consumption while maintaining the programmed gain state stored in the latch of the serial interface. All analog functions are disabled in this mode and current consumption is reduced to 131 μ A (typical). Shutdown mode is enabled when either D7 = 0 or SHDN is set low. This mode overrides the TXEN input pin, but TXEN should be held low to minimize glitching when exiting this mode.

8.2 IC ARCHITECTURE

The MT1530's signal path consists of an input amplifier, a variable attenuator, and a power amplifier as shown in Figure 12. The input amplifier is a fixed-gain, low-noise, differential amplifier with a nominal input impedance of 1.85 k Ω . The variable attenuator is capable of a 51-dB attenuation range in 1-dB steps. The output power amplifier has 12 dB of gain range in 6 dB steps.

8.2.1 INPUT AMPLIFIER

The input amplifier (IA) is a fully differential, low-noise amplifier with no gain adjustment. Its bias may be disabled either by the external \overline{SHDN} pin, or D7 of the serial control register.

For best second-order performance, the IA should be driven differentially. However, the device may be driven in a single-ended mode, with the other unused input bypassed to ground with a 10 nF capacitor. The IA's inputs are self-biasing and must be AC coupled.

8.2.2 VARIABLE ATTENUATOR

The variable attenuator (VA) provides up to 51 dB attenuation of the input signal in nominal 1-dB increments. The architecture is fully differential to minimize glitching and even-order harmonics. This attenuator acts together with the output power amplifier to achieve a nominal 63 dB of gain range, as described in section 8.2.3.

8.2.3 OUTPUT POWER AMPLIFIER

The output power amplifier (PA) is a fully differential amplifier capable of driving +64 dBmV into a 75 Ω load. An off-chip transformer must be used to convert from a differential to a single-ended output. The PA's output impedance is nominally 300 Ω , which is transformed to 75 Ω by the 4:1 impedance ratio transformer. This impedance is maintained when the amplifier is powered down by setting TXEN = low. The amplifier's outputs are powered by +5V connected to the center tap of the transformer's secondary.

The differential nature of the PA provides superior second-order harmonic performance. Additionally, any single-ended transients on the amplifier's outputs that are generated during transmit enable/disable switching are cancelled by this architecture.

In addition to providing output power, the PA also plays a role in the gainprogrammability of the IC. The output amplifier has attenuation settings of 0, 6, and 12 dB. Higher attenuations reduce output power and noise. The programmed gain control code automatically sets the PA's attenuation. Gain control codes of 52 through 63 set the PA's attenuation to 0 dB, putting the PA at maximum power. Gain control codes of 46 to 51 set the PA's attenuation to 6 dB, lowering its power by half. Gain control codes of less than 46 set the PA's attenuation to 12 dB, lowering its power to one quarter of the maximum value. Transmit-disable and shutdown modes turn off power to the PA for maximum isolation and minimum output noise.

8.2.4 PA CONTROL

The PA Control (PAC) both adjusts the output amp's gain, and manages power-up and power-down transients. The PAC uses internal timing circuits to control the ramp-up and ramp-down of the PA's bias block. This orderly ramp keeps the PA's output glitch to very low levels.

The PAC begins a bias ramp-down on the falling edge of TXEN. A rising TXEN produces a bias ramp-up. Note that for a minimum glitch on the output, the rest of the IC must already be powered up by having disabled shutdown mode.

8.3 SERIAL INTERFACE

The serial interface (SI) programs the gain of the MT1530 using an 8-bit control word. The SI uses the gain control word to set the VA's and PA's gains individually using an internal decoder. It has an active-low chip-select (\overline{CS}) to synchronize to the incoming word. Data is clocked MSB first on the rising edge of SCLK. Data is latched on the rising edge of \overline{CS} . Table 4 and Table 5 show the register format. Figure 13 illustrates serial interface timing.

9 TERMINAL CONNECTIONS

Terminal connections for the MT1530 are described in Table 7.

Pin	Function/ Symbol	DESCRIPTION
1	GND	Ground connection
2	VCC1	+5V Power supply for the input amplifier, variable attenuator, and serial interface. Bypass to GND1 with a 0.1 μF decoupling capacitor as close to the part as possible.
3	NC	No connect
4	GND1	Ground connection for the input amplifier and variable attenuator
5	VIN+	Positive input to the input amplifier
6	VIN-	Negative input to the input amplifier. Bypass with capacitor if driving amplifier single-ended.
7	DGND	Ground connection to serial interface
8	CS	Chip select input to serial interface (active low)
9	SDA	Data input to serial interface (active high)
10	SCLK	Clock input to serial interface (positive-edge triggered)
11	NC	No connect
12	SHDN	Shutdown mode input (active low)
13	NC	No connect
14	VCM	Output common-mode bypass. Bypass to GND2 with 0.1 μ F capacitor.
15	VOUT-	PA negative output
16	VOUT+	PA positive output
17	NC	No connect
18	TXEN	PA output enable input (active high)
19	VCC2	+5V Power supply for PA bias and control circuitry. Bypass to GND2 with a 0.1 μF decoupling capacitor as close to the part as possible.
20	GND2	Ground connection for the PA
