

PHOTO IC COUPLER

MT26300, MT26310

T-41-89

APPLICATIONS

- DIGITAL LOGIC ISOLATION
- TELECOMMUNICATION
- ANALOG DATA EQUIPMENT CONTROL
- MICROPROCESSOR SYSTEM INTERFACE
- COMPUTER PERIPHERAL INTERFACE

The MARKTECH MT26300 and MT26310 dual photocouplers consist of a pair of GaAlAs light emitting diodes and integrated high gain, high speed photodetectors. Both units are 8 pin dip packages. The output of the detector circuit is an open collector Schottky clamped transistor. On the 26310 a Faraday shield is integrated on the photodetector chip reducing the effects of capacitance coupling between the input emitter and the high gain stages of the detector. This provides an effective common mode transient immunity of 1000V/μs.

FEATURES

- Input Current Threshold : $I_F=5\text{mA Max.}$
- LSTTL/TTL Compatible : 5V Supply
- Switching Speed : 10MBd (Typ.)
- Guaranteed Performance Over Temperature : 0 ~ 70°C
- Isolation Voltage : 2500 V_{rms} Min.
- Common Mode
- Transient Immunity : 1000V/μs Min. for MT26310

NOTES:

1. The V_{CC} supply voltage to the MT26300 and MT26310 isolator must be bypassed by a $0.01\mu\text{F}$ capacitor or larger. This can be either a ceramic or solid tantalum capacitor with good high frequency characteristic and should be connected as close as possible to the package V_{CC} and GND pins in each device.
2. t_{pHL} — Propagation delay is measured from the 3.75mA level on the LOW to HIGH transition of the input current pulse to the 1.5V level on the HIGH to LOW transition of the output voltage pulse.
3. t_{pLH} — Propagation delay is measured from the 3.75mA level on the HIGH to LOW transition of the input current pulse to the 1.5V level on the LOW to HIGH transition of the output voltage pulse.
4. t_f — Fall time is measured from the 90% to the 10% levels of the HIGH to LOW transition on the output pulse.
5. t_r — Rise time is measured from the 10% to 90% levels of the LOW to HIGH transition on the output pulse.
6. CM_L — The maximum tolerable rate of fall of the common mode voltage to ensure the output will remain in the low output state (i.e., $V_{OUT} < 0.8V$). Measured in volts per microsecond ($V/\mu\text{s}$).
7. CM_H — The maximum tolerable rate of rise of the common mode voltage to ensure the output will remain in the high state (i.e., $V_{OUT} > 2.0V$). Measured in volts per microsecond ($V/\mu\text{s}$).
8. Device considered a two-terminal device: Pins 1, 2, 3 and 4 shorted together, and Pins 5, 6, 7 and 8 shorted together.
9. Measured between pins 1 and 2 shorted together, and pins 3 and 4 shorted together.
