

ULTRA HIGH SPEED SINGLE OPERATIONAL AMPLIFIER

■ GENERAL DESCRIPTION

The **NJM2710** is an ultra high speed hex operational amplifier.

It can swing 260V/ μ s high slew rate and 1GHz gain band width product(10MHz typ. at 40dB) at 5V.

It is suitable for telecommunication related system, digital broadcasting system, high quality scanner and any other high speed signal processing system.

■ PACKAGE OUTLINE

NJM2710M

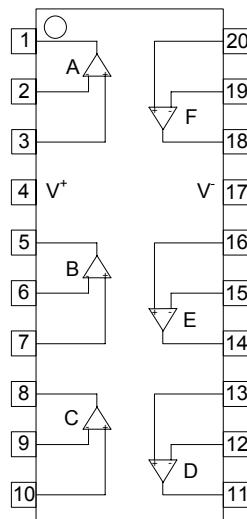

NJM2710V

■ FEATURES

- Operating Voltage (± 2.0 to ± 4.5 V)
- Operating Current (11.4mA typ. at $V^+/V^- = \pm 2.5$ V)
- High Slew Rate (260V/ μ s typ.)
- Gain Bandwidth Product (1GHz typ.)
- Bandwidth (10MHz typ. at 40dB)
- Unity Gain Bandwidth (180MHz typ.)
- Input Offset Voltage (7mV max.)
- Maximum Output Voltage (± 1.5 V typ. at $R_L = 1k\Omega$)
- Open Loop Voltage Gain (75dB typ.)
- Bipolar Technology
- Package Outline DMP20,SSOP20

■ Note:

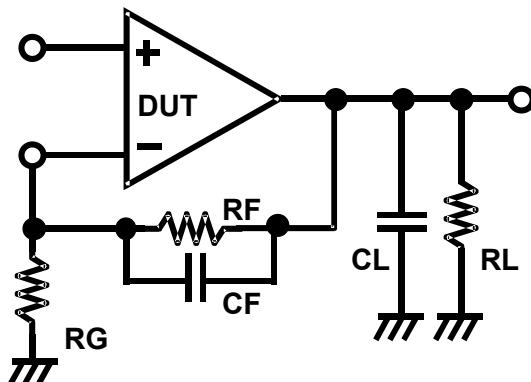

non-inverting amplifier

1. The closed gain should be 6dB or higher to prevent the oscillation.
Unity gain follower application may cause the oscillation.
2. When the closed gain is lower than 20dB, use a compensation capacitor (CF: about 5pF), parallel with the feedback resistor RF to avoid oscillation.
3. Recommended feedback resistor is less than 2kΩ to keep the flatness of the frequency response.
4. Minimize the load capacitor for the better performance.
A large load capacitor CL reduces the frequency response and causes oscillation or ringing.

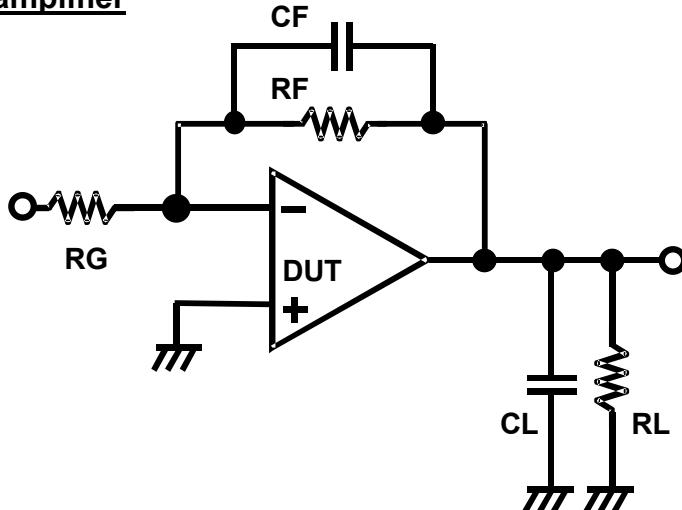

inverting amplifier

1. When the closed gain is lower than 20dB, use a compensation capacitor (CF; recommended from 1pF to 5pF), parallel with the feedback resistor RF to avoid oscillation.
2. Minimize the feedback resistor to keep the frequency response and the slew rate.
(recommended about 1k-ohm)
The proper compensation capacitor CF can counteract oscillation even with a large feedback resistor RF.
3. Total load capacitance should be not more than 100pF.
The oscillation margin may be affected by the total load capacitance.
