The JDSU CT2 Series OC-48 (2.5 Gb/s) transceiver module integrates optics and electronics in a Small Form Factor Pluggable (SFP) package. It is Multisource Agreement (MSA) compatible and designed for operation at 1310 nm and 1550 nm. Although optimized for OC-48, it provides multi-rate capabilities and can be used from OC-3 (155 Mb/s) up to 2.7 Gb/s.

The CT2 Series SFP transceiver provides a fully OC-48 SONET compliant interface between the SONET/SDH photonic layer and the electrical layer. Its microprocessor-based modular design implements all features specified in the SFP MSA compatible 2-wire Serial Digital Diagnostic Monitoring Interface for Optical Transceivers.

The major components in this module include a Fabry-Perot or uncooled distributed feedback (DFB) based optical transmitter, a PIN or APD based optical receiver with integrated transimpedance amplifier (TIA), an APD high voltage circuit (if required), a microprocessor, a limiting post amplifier, and a laser driver. The modular transceiver design offers a "hot-pluggable" interface, allowing the same basic architecture to be used for SR, IR-1, IR-2, LR-1, and LR-2 versions.

Transceiver Pin Descriptions

Pin	Description
TD	Un-clocked, multirate, differential serial bit stream (155 Mb/s to 2.7 Gb/s) used to drive the optical transmitter.
TD _b	Internally AC coupled and terminated via internal 100 Ω differential impedance.
RD	Differential received electrical signal capable of detecting 155 Mb/s to 2.7 Gb/s bit patterns.
RD _b	The differential pair is internally biased and AC coupled. This signal requires 100 Ω external differential termination.
Rate_select	Internally monitored and available for future use. Can be customized for specific applications.
TxDIS	Transmitter Disable Input. A logic HIGH on this input pin disables the transmitter's laser so that there is no optical output. If left open the transmitter will be disabled.
LOS	Loss of Signal (Open Collector). A logic HIGH on this output indicates an incoming signal level that is less than -25 dBm but no greater than -31 dBm for IR and SR configurations and less than -34 dBm but no greater than -40 dBm for LR configurations. LOS shall deassert (logic LOW) when a 3 dB (maximum), 0.5 dB (minimum) hysteresis is obtained.
Tx_fault	Transmitter fault (Open collector). A logic HIGH indicates that the transmitter is in a fault condition.
MOD_DEF(0)	MOD_DEF(0) is internally grounded to indicate the presence of the module. Must be pulled-up on host board with 10 KΩ resistor.
MOD_DEF(1)	MOD_DEF(1) is the clock of the 2 wire interface for module monitoring.
MOD_DEF(2)	MOD_DEF(2) is the data line of the 2 wire interface for module monitoring.
VccR,VccT	Receiver, Transmitter power supply, respectively
VeeR, VeeT	Receiver, Transmitter ground, respectively. The chassis ground and circuit ground isolation is configurable.

1. Measured as fiber coupled power into a standard single mode fiber, typical connector repeatability is ±1 dB. LC duplex cables manufactured by Stratos are not recommended due to a potentially larger window of repeatability.

2. Full spectral width measured 20 dB down from the central wavelength peak under fully modulated conditions.

3. Ratio of the average output power in the dominant longitudinal mode to the power in the most significant side mode in fully modulated conditions.

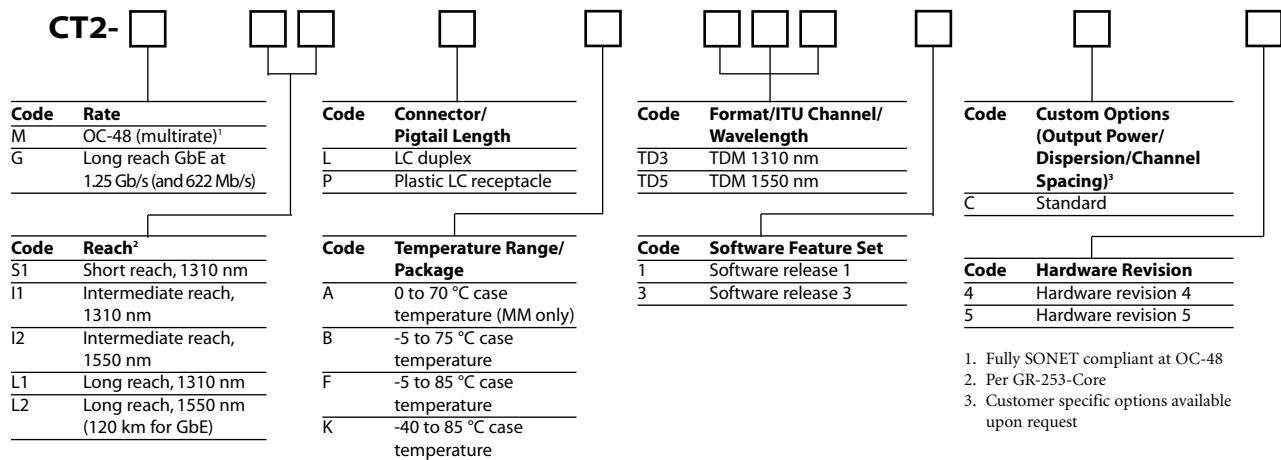

4. Ratio of logic 1 output power to logic 0 output power under fully modulated conditions with a PRBS 23 data pattern.

5. GR-253-CORE, ITU-T, Recommendation G.957. Tested at STM1, STM4, STM16.

6. Formatted OC-48 pattern with scrambled PRBS payload using an Agilent OmniBer as the optical source driving the CT2 optical receiver. The differential data outputs of this optical receiver are used as the electrical inputs for the CT2 transmitter which optically drives the OmniBer receiver input to complete the jitter test circuit. This is a 60 second test as recommended in GR-253.
